debugging

The contents of this module can be included with the header `hpx/modules/debugging.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/debugging.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```
namespace hpx
```

```
namespace util
```

Functions

```
void attach_debugger()
```

Tries to break an attached debugger, if not supported a loop is invoked which gives enough time to attach a debugger manually.

```
namespace hpx
```

```

errors

The contents of this module can be included with the header `hpx/modules/errors.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/errors.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```
namespace hpx
```

Enums

enum error

Possible error conditions.

This enumeration lists all possible error conditions which can be reported from any of the API functions.

Values:

success = 0

The operation was successful.

no_success = 1

The operation did failed, but not in an unexpected manner.

not_implemented = 2

The operation is not implemented.

out_of_memory = 3

The operation caused an out of memory condition.

bad_action_code = 4

bad_component_type = 5

The specified component type is not known or otherwise invalid.

network_error = 6

A generic network error occurred.

version_too_new = 7

The version of the network representation for this object is too new.

version_too_old = 8

The version of the network representation for this object is too old.

version_unknown = 9

The version of the network representation for this object is unknown.

unknown_component_address = 10

```
duplicate_component_address = 11
    The given global id has already been registered.

invalid_status = 12
    The operation was executed in an invalid status.

bad_parameter = 13
    One of the supplied parameters is invalid.

internal_server_error = 14

service_unavailable = 15

bad_request = 16

repeated_request = 17

lock_error = 18

duplicate_console = 19
    There is more than one console locality.

no_registered_console = 20
    There is no registered console locality available.

startup_timed_out = 21

uninitialized_value = 22

bad_response_type = 23

deadlock = 24

assertion_failure = 25

null_thread_id = 26
    Attempt to invoke a API function from a non-HPX thread.

invalid_data = 27

yield_aborted = 28
    The yield operation was aborted.

dynamic_link_failure = 29

commandline_option_error = 30
    One of the options given on the command line is erroneous.

serialization_error = 31
    There was an error during serialization of this object.

unhandled_exception = 32
    An unhandled exception has been caught.

kernel_error = 33
    The OS kernel reported an error.

broken_task = 34
    The task associated with this future object is not available anymore.

task_moved = 35
    The task associated with this future object has been moved.

task_already_started = 36
    The task associated with this future object has already been started.
```

```
future_already_retrieved = 37
    The future object has already been retrieved.

promise_already_satisfied = 38
    The value for this future object has already been set.

future_does_not_support_cancellation = 39
    The future object does not support cancellation.

future_can_not_be_cancelled = 40
    The future can't be canceled at this time.

no_state = 41
    The future object has no valid shared state.

broken.promise = 42
    The promise has been deleted.

thread_resource_error = 43

future_cancelled = 44

thread_cancelled = 45

thread_not_interruptable = 46

duplicate_component_id = 47
    The component type has already been registered.

unknown_error = 48
    An unknown error occurred.

bad_plugin_type = 49
    The specified plugin type is not known or otherwise invalid.

filesystem_error = 50
    The specified file does not exist or other filesystem related error.

bad_function_call = 51
    equivalent of std::bad_function_call

task_canceled_exception = 52
    parallel::v2::task_canceled_exception

task_block_not_active = 53
    task_region is not active

out_of_range = 54
    Equivalent to std::out_of_range.

length_error = 55
    Equivalent to std::length_error.

migration_needs_retry = 56
    migration failed because of global race, retry

namespace hpx
```

Unnamed Group

`error_code make_error_code(error e, throwmode mode = plain)`
 Returns a new `error_code` constructed from the given parameters.

`error_code make_error_code(error e, char const *func, char const *file, long line, throwmode mode = plain)`

`error_code make_error_code(error e, char const *msg, throwmode mode = plain)`
 Returns `error_code(e, msg, mode)`.

`error_code make_error_code(error e, char const *msg, char const *func, char const *file, long line, throwmode mode = plain)`

`error_code make_error_code(error e, std::string const &msg, throwmode mode = plain)`
 Returns `error_code(e, msg, mode)`.

`error_code make_error_code(error e, std::string const &msg, char const *func, char const *file, long line, throwmode mode = plain)`

`error_code make_error_code(std::exception_ptr const &e)`

Functions

`std::error_category const &get_hpx_category()`
 Returns generic HPX error category used for new errors.

`std::error_category const &get_hpx_rethrow_category()`
 Returns generic HPX error category used for errors re-thrown after the exception has been de-serialized.

`error_code make_success_code(throwmode mode = plain)`
 Returns `error_code(hpx::success, "success", mode)`.

`class error_code : public error_code`
`#include <error_code.hpp>` A `hpx::error_code` represents an arbitrary error condition.

The class `hpx::error_code` describes an object used to hold error code values, such as those originating from the operating system or other low-level application program interfaces.

Note Class `hpx::error_code` is an adjunct to error reporting by exception

Public Functions

`error_code(throwmode mode = plain)`
 Construct an object of type `error_code`.

Parameters

- mode: The parameter `mode` specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

Exceptions

- nothing:

error_code (*error e, throwmode mode = plain*)

Construct an object of type *error_code*.

Parameters

- *e*: The parameter *e* holds the hpx::error code the new exception should encapsulate.
- *mode*: The parameter *mode* specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Exceptions

- nothing:

error_code (*error e, char const *func, char const *file, long line, throwmode mode = plain*)

Construct an object of type *error_code*.

Parameters

- *e*: The parameter *e* holds the hpx::error code the new exception should encapsulate.
- *func*: The name of the function where the error was raised.
- *file*: The file name of the code where the error was raised.
- *line*: The line number of the code line where the error was raised.
- *mode*: The parameter *mode* specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Exceptions

- nothing:

error_code (*error e, char const *msg, throwmode mode = plain*)

Construct an object of type *error_code*.

Parameters

- *e*: The parameter *e* holds the hpx::error code the new exception should encapsulate.
- *msg*: The parameter *msg* holds the error message the new exception should encapsulate.
- *mode*: The parameter *mode* specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Exceptions

- std::bad_alloc: (if allocation of a copy of the passed string fails).

error_code (*error e, char const *msg, char const *func, char const *file, long line, throwmode mode = plain*)

Construct an object of type *error_code*.

Parameters

- *e*: The parameter *e* holds the hpx::error code the new exception should encapsulate.
- *msg*: The parameter *msg* holds the error message the new exception should encapsulate.
- *func*: The name of the function where the error was raised.
- *file*: The file name of the code where the error was raised.
- *line*: The line number of the code line where the error was raised.
- *mode*: The parameter *mode* specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Exceptions

- std::bad_alloc: (if allocation of a copy of the passed string fails).

error_code (*error e, std::string const &msg, throwmode mode = plain*)

Construct an object of type *error_code*.

Parameters

- *e*: The parameter *e* holds the hpx::error code the new exception should encapsulate.
- *msg*: The parameter *msg* holds the error message the new exception should encapsulate.
- *mode*: The parameter *mode* specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Exceptions

- `std::bad_alloc`: (if allocation of a copy of the passed string fails).

error_code (*error e, std::string const &msg, char const *func, char const *file, long line,*

throwmode mode = plain)

Construct an object of type *error_code*.

Parameters

- *e*: The parameter *e* holds the hpx::error code the new exception should encapsulate.
- *msg*: The parameter *msg* holds the error message the new exception should encapsulate.
- *func*: The name of the function where the error was raised.
- *file*: The file name of the code where the error was raised.
- *line*: The line number of the code line where the error was raised.
- *mode*: The parameter *mode* specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Exceptions

- `std::bad_alloc`: (if allocation of a copy of the passed string fails).

`std::string get_message() const`

Return a reference to the error message stored in the *hpx::error_code*.

Exceptions

- `nothing`:

`void clear()`

Clear this *error_code* object. The postconditions of invoking this method are.

- `value() == hpx::success` and `category() == hpx::get_hpx_category()`

error_code (*error_code const &rhs*)

Copy constructor for *error_code*

Note This function maintains the error category of the left hand side if the right hand side is a success code.

error_code &operator= (*error_code const &rhs*)

Assignment operator for *error_code*

Note This function maintains the error category of the left hand side if the right hand side is a success code.

Private Functions

```
error_code (int err, hpx::exception const &e)  
error_code (std::exception_ptr const &e)
```

Private Members

```
std::exception_ptr exception_
```

```

Typedefs

```
using custom_exception_info_handler_type = std::function<hpx::exception_info (std::string  
const&,  
std::string  
const&,  
long,  
std::string  
const&) >  
  
using pre_exception_handler_type = std::function<void () >
```

Functions

```
void set_custom_exception_info_handler (custom_exception_info_handler_type f)
```

```
void set_pre_exception_handler (pre_exception_handler_type f)
```

```
std::string get_error_what (exception_info const &xi)
```

Return the error message of the thrown exception.

The function `hpx::get_error_what` can be used to extract the diagnostic information element representing the error message as stored in the given exception instance.

Return The error message stored in the exception If the exception instance does not hold this information, the function will return an empty string.

See `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`, `hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()` `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_config()`, `hpx::get_error_state()`

Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Exceptions

- `std::bad_alloc`: (if one of the required allocations fails)

`error get_error(hpx::exception const &e)`

Return the error code value of the exception thrown.

The function `hpx::get_error` can be used to extract the diagnostic information element representing the error value code as stored in the given exception instance.

Return The error value code of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return `hpx::naming::invalid_locality_id`.

See `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters

- `e`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception`, `hpx::error_code`, or `std::exception_ptr`.

Exceptions

- nothing:

`error get_error(hpx::error_code const &e)`

`std::string get_error_function_name(hpx::exception_info const &xi)`

Return the function name from which the exception was thrown.

The function `hpx::get_error_function_name` can be used to extract the diagnostic information element representing the name of the function as stored in the given exception instance.

Return The name of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

See `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_file_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`,
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Exceptions

- `std::bad_alloc`: (if one of the required allocations fails)

```
std::string get_error_file_name (hpx::exception_info const &xi)
```

Return the (source code) file name of the function from which the exception was thrown.

The function `hpx::get_error_file_name` can be used to extract the diagnostic information element representing the name of the source file as stored in the given exception instance.

Return The name of the source file of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

See `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`,
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Exceptions

- `std::bad_alloc`: (if one of the required allocations fails)

```
long get_error_line_number (hpx::exception_info const &xi)
```

Return the line number in the (source code) file of the function from which the exception was thrown.

The function `hpx::get_error_line_number` can be used to extract the diagnostic information element representing the line number as stored in the given exception instance.

Return The line number of the place where the exception was thrown. If the exception instance does not hold this information, the function will return -1.

See `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_os_thread()`,
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Exceptions

- nothing:

```
class exception : public system_error
```

#include <exception.hpp> A `hpx::exception` is the main exception type used by HPX to report errors.

The `hpx::exception` type is the main exception type used by HPX to report errors. Any exceptions thrown by functions in the HPX library are either of this type or of a type derived from it. This implies that it is always safe to use this type only in catch statements guarding HPX library calls.

Subclassed by `hpx::exception_list`

Public Functions

exception (*error e = success*)

Construct a *hpx::exception* from a *hpx::error*.

Parameters

- *e*: The parameter *e* holds the *hpx::error* code the new exception should encapsulate.

exception (*std::system_error const &e*)

Construct a *hpx::exception* from a *boost::system_error*.

exception (*std::error_code const &e*)

Construct a *hpx::exception* from a *boost::system::error_code* (this is new for Boost V1.69). This constructor is required to compensate for the changes introduced as a resolution to LWG3162 (<https://cplusplus.github.io/LWG/issue3162>).

exception (*error e, char const *msg, throwmode mode = plain*)

Construct a *hpx::exception* from a *hpx::error* and an error message.

Parameters

- *e*: The parameter *e* holds the *hpx::error* code the new exception should encapsulate.
- *msg*: The parameter *msg* holds the error message the new exception should encapsulate.
- *mode*: The parameter *mode* specifies whether the returned *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

exception (*error e, std::string const &msg, throwmode mode = plain*)

Construct a *hpx::exception* from a *hpx::error* and an error message.

Parameters

- *e*: The parameter *e* holds the *hpx::error* code the new exception should encapsulate.
- *msg*: The parameter *msg* holds the error message the new exception should encapsulate.
- *mode*: The parameter *mode* specifies whether the returned *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

~exception()

Destruct a *hpx::exception*

Exceptions

- nothing:

error get_error() const

The function *get_error()* returns the *hpx::error* code stored in the referenced instance of a *hpx::exception*. It returns the *hpx::error* code this exception instance was constructed from.

Exceptions

- nothing:

error_code get_error_code (throwmode mode = plain) const

The function *get_error_code()* returns a *hpx::error_code* which represents the same error condition as this *hpx::exception* instance.

Parameters

- mode: The parameter mode specifies whether the returned *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

```
struct thread_interrupted : public exception
```

```
#include <exception.hpp> A hpx::thread_interrupted is the exception type used by HPX to interrupt a running HPX thread.
```

The *hpx::thread_interrupted* type is the exception type used by HPX to interrupt a running thread.

A running thread can be interrupted by invoking the `interrupt()` member function of the corresponding *hpx::thread* object. When the interrupted thread next executes one of the specified interruption points (or if it is currently blocked whilst executing one) with interruption enabled, then a *hpx::thread_interrupted* exception will be thrown in the interrupted thread. If not caught, this will cause the execution of the interrupted thread to terminate. As with any other exception, the stack will be unwound, and destructors for objects of automatic storage duration will be executed.

If a thread wishes to avoid being interrupted, it can create an instance of *hpx::this_thread::disable_interruption*. Objects of this class disable interruption for the thread that created them on construction, and restore the interruption state to whatever it was before on destruction.

```
void f()
{
    // interruption enabled here
    {
        hpx::this_thread::disable_interruption di;
        // interruption disabled
        {
            hpx::this_thread::disable_interruption di2;
            // interruption still disabled
        } // di2 destroyed, interruption state restored
        // interruption still disabled
    } // di destroyed, interruption state restored
    // interruption now enabled
}
```

The effects of an instance of *hpx::this_thread::disable_interruption* can be temporarily reversed by constructing an instance of *hpx::this_thread::restore_interruption*, passing in the *hpx::this_thread::disable_interruption* object in question. This will restore the interruption state to what it was when the *hpx::this_thread::disable_interruption* object was constructed, and then disable interruption again when the *hpx::this_thread::restore_interruption* object is destroyed.

```
void g()
{
    // interruption enabled here
    {
        hpx::this_thread::disable_interruption di;
        // interruption disabled
        {
            hpx::this_thread::restore_interruption ri(di);
            // interruption now enabled
        } // ri destroyed, interruption disable again
    } // di destroyed, interruption state restored
}
```

(continues on next page)

(continued from previous page)

```
// interruption now enabled
}
```

At any point, the interruption state for the current thread can be queried by calling `hpx::this_thread::interruption_enabled()`.

```
namespace hpx
```

Enums

`enum throwmode`

Encode error category for new `error_code`.

Values:

```
plain = 0
rethrow = 1
lightweight = 0x80
```

Variables

`error_code throws`

Predefined `error_code` object used as “throw on error” tag.

The predefined `hpx::error_code` object `hpx::throws` is supplied for use as a “throw on error” tag.

Functions that specify an argument in the form ‘`error_code& ec=throws`’ (with appropriate namespace qualifiers), have the following error handling semantics:

If `&ec != &throws` and an error occurred: `ec.value()` returns the implementation specific error number for the particular error that occurred and `ec.category()` returns the `error_category` for `ec.value()`.

If `&ec != &throws` and an error did not occur, `ec.clear()`.

If an error occurs and `&ec == &throws`, the function throws an exception of type `hpx::exception` or of a type derived from it. The exception’s `get_errorcode()` member function returns a reference to an `hpx::error_code` object with the behavior as specified above.

Defines

```
HPX_DEFINE_ERROR_INFO (NAME, TYPE)
```

```
namespace hpx
```

Functions

```

```

Private Members

```
node_ptr _data
namespace hpx
```

```
class exception_list : public hpx::exception
#include <exception_list.hpp> The class exception_list is a container of exception_ptr objects parallel algorithms may use to communicate uncaught exceptions encountered during parallel execution to the caller of the algorithm
```

The type *exception_list*::const_iterator fulfills the requirements of a forward iterator.

Public Types

```
using iterator=exception_list_type::const_iterator
bidirectional iterator
```

Public Functions

```
std::size_t size() const
```

The number of *exception_ptr* objects contained within the *exception_list*.

Note Complexity: Constant time.

```
exception_list_type::const_iterator begin() const
```

An iterator referring to the first *exception_ptr* object contained within the *exception_list*.

```
exception_list_type::const_iterator end() const
```

An iterator which is the past-the-end value for the *exception_list*.

Defines

HPX_THROW_EXCEPTION (*errcode, f, ...*)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX_THROW_EXCEPTION* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter *errcode* holds the *hpx::error* code the new exception should encapsulate. The parameter *f* is expected to hold the name of the function exception is thrown from and the parameter *msg* holds the error message the new exception should encapsulate.

```
void raise_exception()
{
    // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_EXCEPTION(hpx::no_success, "raise_exception", "simulated error");
}
```

Example:

HPX_THROWS_IF (*ec, errcode, f, ...*)

Either throw a *hpx::exception* or initialize *hpx::error_code* from the given parameters.

The macro *HPX_THROWS_IF* can be used to either throw a *hpx::exception* or to initialize a *hpx::error_code* from the given parameters. If *&ec == &hpx::throws*, the semantics of this macro are equivalent to *HPX_THROW_EXCEPTION*. If *&ec != &hpx::throws*, the *hpx::error_code* instance *ec* is initialized instead.

The parameter *errcode* holds the *hpx::error* code from which the new exception should be initialized. The parameter *f* is expected to hold the name of the function exception is thrown from and the parameter *msg* holds the error message the new exception should encapsulate.

execution

The contents of this module can be included with the header *hpx/modules/execution.hpp*. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header *hpx/modules/execution.hpp*, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX API*.

struct auto_chunk_size

#include <auto_chunk_size.hpp> Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

Public Functions

```
constexpr auto_chunk_size (std::uint64_t num_iters_for_timing = 0)
    Construct an auto_chunk_size executor parameters object
```

Note Default constructed auto_chunk_size executor parameter types will use 80 microseconds as the minimal time for which any of the scheduled chunks should run.

```
auto_chunk_size (hpx::chrono::steady_duration const &rel_time, std::uint64_t
                    num_iters_for_timing = 0)
    Construct an auto_chunk_size executor parameters object
```

Parameters

- `rel_time`: [in] The time duration to use as the minimum to decide how many loop iterations should be combined.

```
namespace parallel
```

```
namespace execution
```

TypeDefs

```
typedef hpx::is_sequenced_execution_policy<T> instead
```

```
namespace hpx
```

```
namespace execution
```

```
struct dynamic_chunk_size
```

#include <dynamic_chunk_size.hpp> Loop iterations are divided into pieces of size `chunk_size` and then dynamically scheduled among the threads; when a thread finishes one chunk, it is dynamically assigned another If `chunk_size` is not specified, the default chunk size is 1.

Note This executor parameters type is equivalent to OpenMP's DYNAMIC scheduling directive.

Public Functions

```
constexpr dynamic_chunk_size (std::size_t chunk_size = 1)
    Construct a dynamic_chunk_size executor parameters object
```

Parameters

- `chunk_size`: [in] The optional chunk size to use as the number of loop iterations to schedule together. The default chunk size is 1.

```
namespace hpx
```

```
namespace parallel
```

```
namespace execution
```

Functions

```
HPX_HAS_MEMBER_XXX_TRAIT_DEF(has_pending_closures)
HPX_HAS_MEMBER_XXX_TRAIT_DEF(get_pu_mask)
HPX_HAS_MEMBER_XXX_TRAIT_DEF(set_scheduler_mode)
```

Variables

```
hpx::parallel::execution::has_pending_closures_t has_pending_closures
hpx::parallel::execution::get_pu_mask_t get_pu_mask
hpx::parallel::execution::set_scheduler_mode_t set_scheduler_mode

struct get_pu_mask_t : public hpx::functional::detail::tagFallback<get_pu_mask_t>
    #include <execution_information.hpp> Retrieve the bitmask describing the processing units the
    given thread is allowed to run on

All threads::executors invoke sched.get_pu_mask().
```

Note If the executor does not support this operation, this call will always invoke hpx::threads::get_pu_mask()

Parameters

- exec: [in] The executor object to use for querying the number of pending tasks.
- topo: [in] The topology object to use to extract the requested information.
- thream_num: [in] The sequence number of the thread to retrieve information for.

Private Functions

```
template<typename Executor>
decltype(auto) friend tagFallback_invoke(get_pu_mask_t, Executor&&, threads::topology &topo, std::size_t thread_num)

template<typename Executor>
decltype(auto) friend tag_invoke(get_pu_mask_t, Executor &&exec, threads::topology &topo, std::size_t thread_num)

struct has_pending_closures_t : public hpx::functional::detail::tagFallback<has_pending_closures_t>
    #include <execution_information.hpp> Retrieve whether this executor has operations pending or
    not.
```

Note If the executor does not expose this information, this call will always return *false*

Parameters

- exec: [in] The executor object to use to extract the requested information for.

Private Functions

```
template<typename Executor>
decltype(auto) friend tagFallback_invoke(has_pending_closures_t, Executor&&)

template<typename Executor>
decltype(auto) friend tag_invoke(has_pending_closures_t, Executor &&exec)

struct set_scheduler_mode_t : public hpx::functional::detail::tagFallback<set_scheduler_mode_t>
#include <execution_information.hpp> Set various modes of operation on the scheduler underneath the given executor.
```

Note This calls exec.set_scheduler_mode(mode) if it exists; otherwise it does nothing.

Parameters

- exec: [in] The executor object to use.
- mode: [in] The new mode for the scheduler to pick up

Friends

```
template<typename Executor, typename Mode>
void tagFallback_invoke(set_scheduler_mode_t, Executor&&, Mode const&)

template<typename Executor, typename Mode>
void tag_invoke(set_scheduler_mode_t, Executor &&exec, Mode const &mode)

namespace hpx

using type = detail::executor_parameters<std::decay_t<Params>...>

template<typename Param>
struct executor_parameters_join<Param>
```

Public Types

```
template<>
using type = Param

namespace hpx

namespace parallel

namespace execution
```

Variables

```
hpx::parallel::execution::get_chunk_size_t get_chunk_size
hpx::parallel::execution::maximal_number_of_chunks_t maximal_number_of_chunks
hpx::parallel::execution::reset_thread_distribution_t reset_thread_distribution
hpx::parallel::execution::processing_units_count_t processing_units_count
hpx::parallel::execution::mark_begin_execution_t mark_begin_execution
hpx::parallel::execution::mark_end_of_scheduling_t mark_end_of_scheduling
hpx::parallel::execution::mark_end_execution_t mark_end_execution

struct get_chunk_size_t : public hpx::functional::detail::tag_fallback<get_chunk_size_t>
    #include <execution_parameters_fwd.hpp> Return the number of invocations of the given function f which should be combined into a single task
```

Note The parameter *f* is expected to be a nullary function returning a `std::size_t` representing the number of iteration the function has already executed (i.e. which don't have to be scheduled anymore).

Parameters

- `params`: [in] The executor parameters object to use for determining the chunk size for the given number of tasks `num_tasks`.
- `exec`: [in] The executor object which will be used for scheduling of the loop iterations.
- `f`: [in] The function which will be optionally scheduled using the given executor.
- `cores`: [in] The number of cores the number of chunks should be determined for.
- `num_tasks`: [in] The number of tasks the chunk size should be determined for

Private Functions

```
template<typename Parameters, typename Executor, typename F>
decltype(auto) friend tagFallback_invoke(get_chunk_size_t,           Parameters
                                         &&params, Executor &&exec, F
                                         &&f, std::size_t cores, std::size_t
                                         num_tasks)

struct mark_begin_execution_t : public hpx::functional::detail::tag_fallback<mark_begin_execution_t>
#include <execution_parameters_fwd.hpp> Mark the begin of a parallel algorithm execution
```

Note This calls params.mark_begin_execution(exec) if it exists; otherwise it does nothing.

Parameters

- params: [in] The executor parameters object to use as a fallback if the executor does not expose

Private Functions

```
template<typename Parameters, typename Executor>
decltype(auto) friend tagFallback_invoke(mark_begin_execution_t, Parameters
                                         &&params, Executor &&exec)

struct mark_end_execution_t : public hpx::functional::detail::tag_fallback<mark_end_execution_t>
#include <execution_parameters_fwd.hpp> Mark the end of a parallel algorithm execution
```

Note This calls params.mark_end_execution(exec) if it exists; otherwise it does nothing.

Parameters

- params: [in] The executor parameters object to use as a fallback if the executor does not expose

Private Functions

```
template<typename Parameters, typename Executor>
decltype(auto) friend tagFallback_invoke(mark_end_execution_t, Parameters
                                         &&params, Executor &&exec)

struct mark_end_of_scheduling_t : public hpx::functional::detail::tag_fallback<mark_end_of_scheduling_t>
#include <execution_parameters_fwd.hpp> Mark the end of scheduling tasks during parallel algorithm execution
```

Note This calls params.mark_end_of_scheduling(exec) if it exists; otherwise it does nothing.

Parameters

- params: [in] The executor parameters object to use as a fallback if the executor does not expose

Private Functions

```
template<typename Parameters, typename Executor>
decltype(auto) friend tagFallback_invoke(mark_end_of_scheduling_t, Parameters &&params, Executor &&exec)

struct maximal_number_of_chunks_t : public hpx::functional::detail::tag_fallback<maximal_number_of_chunks_t>
#include <execution_parameters_fwd.hpp> Return the largest reasonable number of chunks to
create for a single algorithm invocation.
```

Parameters

- params: [in] The executor parameters object to use for determining the number of chunks for the given number of cores.
- exec: [in] The executor object which will be used for scheduling of the loop iterations.
- cores: [in] The number of cores the number of chunks should be determined for.
- num_tasks: [in] The number of tasks the chunk size should be determined for

Private Functions

```
template<typename Parameters, typename Executor>
decltype(auto) friend tagFallback_invoke(maximal_number_of_chunks_t, Parameters &&params, Executor &&exec, std::size_t cores, std::size_t num_tasks)

struct processing_units_count_t : public hpx::functional::detail::tag_fallback<processing_units_count_t>
#include <execution_parameters_fwd.hpp> Retrieve the number of (kernel-)threads used by the
associated executor.
```

Note This calls params.processing_units_count(Executor&&) if it exists; otherwise it forwards the request to the executor parameters object.

Parameters

- params: [in] The executor parameters object to use as a fallback if the executor does not expose

Private Functions

```
template<typename Parameters, typename Executor>
decltype(auto) friend tagFallback_invoke(processing_units_count_t, Parameters &&params, Executor &&exec)

struct reset_thread_distribution_t : public hpx::functional::detail::tag_fallback<reset_thread_distribution_t>
#include <execution_parameters_fwd.hpp> Reset the internal round robin thread distribution
scheme for the given executor.
```

Note This calls params.reset_thread_distribution(exec) if it exists; otherwise it does nothing.

Parameters

- params: [in] The executor parameters object to use for resetting the thread distribution scheme.
- exec: [in] The executor object to use.

Private Functions

```
template<typename Parameters, typename Executor>
decltype(auto) friend tag_fallback_invoke(reset_thread_distribution_t, Parameters &&params, Executor &&exec)

namespace hpx

namespace execution

struct guided_chunk_size
#include <guided_chunk_size.hpp> Iterations are dynamically assigned to threads in blocks as threads
request them until no blocks remain to be assigned. Similar to dynamic_chunk_size except that the
block size decreases each time a number of loop iterations is given to a thread. The size of the initial
block is proportional to number_of_iterations / number_of_cores. Subsequent blocks are proportional
to number_of_iterations_remaining / number_of_cores. The optional chunk size parameter defines the
minimum block size. The default chunk size is 1.
```

Note This executor parameters type is equivalent to OpenMP's GUIDED scheduling directive.

Public Functions

```
constexpr guided_chunk_size(std::size_t min_chunk_size = 1)
Construct a guided_chunk_size executor parameters object
```

Parameters

- *min_chunk_size*: [in] The optional minimal chunk size to use as the minimal number of loop iterations to schedule together. The default minimal chunk size is 1.

```
namespace hpx
```

```
namespace execution
```

```
struct persistent_auto_chunk_size
#include <persistent_auto_chunk_size.hpp> Loop iterations are divided into pieces and then assigned
to threads. The number of loop iterations combined is determined based on measurements of how long
the execution of 1% of the overall number of iterations takes. This executor parameters type makes
sure that as many loop iterations are combined as necessary to run for the amount of time specified.
```

Public Functions

```
constexpr persistent_auto_chunk_size(std::uint64_t num_iters_for_timing = 0)
Construct an persistent_auto_chunk_size executor parameters object
```

Note Default constructed persistent_auto_chunk_size executor parameter types will use 0 microseconds as the execution time for each chunk and 80 microseconds as the minimal time for which any of the scheduled chunks should run.

```
persistent_auto_chunk_size(hpx::chrono::steady_duration const &time_cs,
std::uint64_t num_iters_for_timing = 0)
```

Construct an persistent_auto_chunk_size executor parameters object

Parameters

- *time_cs*: The execution time for each chunk.

```
persistent_auto_chunk_size(hpx::chrono::steady_duration const &time_cs,
hpx::chrono::steady_duration const &rel_time,
std::uint64_t num_iters_for_timing = 0)
```

Construct an persistent_auto_chunk_size executor parameters object

Parameters

- *rel_time*: [in] The time duration to use as the minimum to decide how many loop iterations should be combined.
- *time_cs*: The execution time for each chunk.

`execution_base`

The contents of this module can be included with the header `hpx/modules/execution_base.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/execution_base.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX* API.

Functions

```
template<typename O>
void start(O &&o)
    start is a customization point object. The expression
    hpx::execution::experimental::start(r) is equivalent to:
    • r.start(), if that expression is valid. If the function selected does not signal the receiver
        r's done channel, the program is ill-formed (no diagnostic required).
    • Otherwise, `start(r), if that expression is valid, with overload resolution performed in a context
        that include the declaration void start();
    • Otherwise, the expression is ill-formed.
```

The customization is implemented in terms of `hpx::functional::tag_invoke`.

Variables

```

hpx::execution::experimental::start_t start
template<typename O>HPX_INLINE_CONSTEXPR_VARIABLE bool hpx::execution::experimental::is_operation_state(O)
struct is_operation_state
#include <operation_state.hpp> An operation_state is an object representing the asynchronous operation that has been returned from calling hpx::execution::experimental::connect with a sender and a receiver. The only operation on an operation_state is:
• hpx::execution::experimental::start
hpx::execution::experimental::start can be called exactly once. Once it has been invoked, the caller needs to ensure that the receiver's completion signaling operations strongly happen before the destructor of the state is called. The call to hpx::execution::experimental::start needs to happen strongly before the completion signaling operations.

namespace hpx

namespace execution

namespace experimental

```

Functions

```

template<typename R, typename ...As>
void set_value(R &&r, As&&... as)
    set_value is a customization point object. The expression
    hpx::execution::set_value(r, as...) is equivalent to:
    • r.set_value(as...), if that expression is valid. If the function selected does not send
        the value(s) as... to the Receiver r's value channel, the program is ill-formed (no diagnostic
        required).
    • Otherwise, `set_value(r, as...), if that expression is valid, with overload resolution performed
        in a context that include the declaration void set_value();
    • Otherwise, the expression is ill-formed.
The customization is implemented in terms of hpx::functional::tag_invoke.

```

```

template<typename R>
void set_done(R &&r)
    set_done is a customization point object. The expression hpx::execution::set_done(r)
    is equivalent to:
    • r.set_done(), if that expression is valid. If the function selected does not signal the Re-
        ceiver r's done channel, the program is ill-formed (no diagnostic required).
    • Otherwise, `set_done(r), if that expression is valid, with overload resolution performed in a
        context that include the declaration void set_done();
    • Otherwise, the expression is ill-formed.
The customization is implemented in terms of hpx::functional::tag_invoke.

```

```

template<typename R, typename E>
void set_error(R &&r, E &&e)
    set_error is a customization point object. The expression
    hpx::execution::set_error(r, e) is equivalent to:

```

- `r.set_done(e)`, if that expression is valid. If the function selected does not send the error `e` the Receiver `r`'s error channel, the program is ill-formed (no diagnostic required).
- Otherwise, ``set_error(r, e)`, if that expression is valid, with overload resolution performed in a context that include the declaration `void set_error();`
- Otherwise, the expression is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`.

```

```
template<typename T, typename E>
struct is_receiver
```

`#include <receiver.hpp>` Receiving values from asynchronous computations is handled by the Receiver concept. A Receiver needs to be able to receive an error or be marked as being canceled. As such, the Receiver concept is defined by having the following two customization points defined, which form the completion-signal operations:

- `hpx::execution::experimental::set_done`
- `hpx::execution::experimental::set_error`

Those two functions denote the completion-signal operations. The Receiver contract is as follows:

- None of a Receiver's completion-signal operation shall be invoked before `hpx::execution::experimental::start` has been called on the operation state object that was returned by connecting a Receiver to a sender `hpx::execution::experimental::connect`.
- Once `hpx::execution::start` has been called on the operation state object, exactly one of the Receiver's completion-signal operation shall complete without an exception before the Receiver is destroyed

Once one of the Receiver's completion-signal operation has been completed without throwing an exception, the Receiver contract has been satisfied. In other words: The asynchronous operation has been completed.

See `hpx::execution::experimental::is_receiver_of`

```
template<typename T, typename ...As>
struct is_receiver_of
#include <receiver.hpp> The receiver_of concept is a refinement of the Receiver concept by requiring one additional completion-signal operation:
```

- `hpx::execution::set_value`

This completion-signal operation adds the following to the Receiver's contract:

- If `hpx::execution::set_value` exits with an exception, it is still valid to call `hpx::execution::set_error` or `hpx::execution::set_done`

See `hpx::execution::traits::is_receiver`

namespace hpx

```
namespace util
```

namespace hpx
```

```
namespace execution_base
```

```
struct resource_base
#include <resource_base.hpp> TODO: implement, this is currently just a dummy.
```

Public Functions

```
virtual ~resource_base()

namespace hpx

namespace execution

namespace experimental
```

Typedefs

```
template<typename S, typename R>
using connect_result_t = typename hpx::util::invoke_result<connect_t, S, R>::type
```

Functions

```
template<typename S, typename R>
void connect(S &&s, R &&r)
```

connect is a customization point object. For some subexpression *s* and *r*, let *S* be the type such that `decltype((s))` is *S* and let *R* be the type such that `decltype((r))` is *R*. The result of the expression `hpx::execution::experimental::connect(s, r)` is then equivalent to:

- `s.connect(r)`, if that expression is valid and returns a type satisfying the `operation_state` concept.
See `hpx::execution::experimental::traits::is_operation_state` and if *S* satisfies the `sender` concept.
- `s.connect(r)`, if that expression is valid and returns a type satisfying the `operation_state` concept.
See `hpx::execution::experimental::traits::is_operation_state` and if *S* satisfies the `sender` concept. Overload resolution is performed in a context that include the declaration `void connect();`

- Otherwise, the expression is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`.

Variables

```
template<typename Sender>HPX_INLINE_CONSTEXPR_VARIABLE bool hpx::execution::experimental::connect_t connect
hpx::execution::experimental::schedule_t schedule

template<typename Scheduler>HPX_INLINE_CONSTEXPR_VARIABLE bool hpx::execution::experimental::invocable_archetype
```

Public Functions

```
void operator()()
```

template<typename **Sender**>
struct is_sender

#include <sender.hpp> The name schedule denotes a customization point object. For some subexpression s, let S be decltype(s)). The expression schedule(s) is expression-equivalent to:

- * s.schedule(), **if** that expression is valid and its type models sender.
 - * Otherwise, schedule(s), **if** that expression is valid and its type models sender with overload resolution performed in a context that includes the declaration
- ```
void schedule();
```
- and that does not include a declaration of schedule.
- \* Otherwise, schedule(s) is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`. A sender is a type that is describing an asynchronous operation. The operation itself might not have started yet. In order to get the result of this asynchronous operation, a sender needs to be connected to a receiver with the corresponding value, error and done channels:

- `hpx::execution::experimental::connect`

In addition, `hpx::execution::experimental:::sender_traits` needs to be specialized in some form.

A sender's destructor shall not block pending completion of submitted operations.

```
template<typename Sender, typename Receiver>
```

**struct is\_sender\_to**

*#include <sender.hpp>*

See `is_sender`

```
template<typename Sender>
```

**struct sender\_traits**

*#include <sender.hpp>* `sender_traits` expose the different value and error types exposed by a sender. This can be either specialized directly for user defined sender types or embedded value\_types, error\_types and sends\_done inside the sender type can be provided.

```
Subclassed by hpx::execution::experimental:::sender_traits< Sender
& >, hpx::execution::experimental:::sender_traits< Sender &&
>, hpx::execution::experimental:::sender_traits< Sender const >,
hpx::execution::experimental:::sender_traits< Sender volatile >
```

## executors

The contents of this module can be included with the header `hpx/modules/executors.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/executors.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```
namespace hpx
```

```
namespace execution
```

```
namespace experimental
```

## Functions

```
template<typename Executor>

annotating_executor(Executor &&exec, std::string annotation)

namespace hpx

namespace parallel

namespace execution
```

## TypeDefs

```
using current_executor = parallel::execution::thread_pool_executor

namespace this_thread
```

## Functions

`parallel::execution::current_executor get_executor(error_code &ec = throws)`  
Returns a reference to the executor which was used to create the current thread.

### Exceptions

- If: `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::invalid_status`.

```
namespace threads
```

## Functions

`parallel::execution::current_executor get_executor(thread_id_type const &id, error_code &ec = throws)`  
Returns a reference to the executor which was used to create the given thread.

### Exceptions

- If: `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::invalid_status`.

### struct parallel\_task\_policy

`#include <execution_policy.hpp>` Extension: The class *parallel\_task\_policy* is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the *parallel\_policy*.

## Public Types

**using executor\_type = parallel\_executor**

The type of the executor associated with this execution policy.

**using executor\_parameters\_type = parallel::execution::extract\_executor\_parameters<executor\_type>::type**

The type of the associated executor parameters object which is associated with this execution policy

**using execution\_category = parallel\_execution\_tag**

The category of the execution agents created by this execution policy.

## Public Functions

**constexpr parallel\_task\_policy operator() (task\_policy\_tag) const**

Create a new *parallel\_task\_policy* from itself

**Return** The new *parallel\_task\_policy*

### Parameters

- tag: [in] Specify that the corresponding asynchronous execution policy should be used

**constexpr decltype(auto) operator() (non\_task\_policy\_tag) const**

Create a new non task parallel policy from itself

**Return** The new non task *parallel\_policy*

### Parameters

- tag: [in] Specify that the corresponding execution policy should be used

**template<typename Executor>**

**constexpr decltype(auto) on (Executor &&exec) const**

Create a new *parallel\_task\_policy* from given executor

**Note** Requires: `is_executor<Executor>::value` is true

**Return** The new *parallel\_task\_policy*

### Template Parameters

- Executor: The type of the executor to associate with this execution policy.

### Parameters

- exec: [in] The executor to use for the execution of the parallel algorithm the returned execution policy is used with.

**template<typename ...Parameters>**

**constexpr decltype(auto) with (Parameters&&... params) const**

Create a new *parallel\_policy\_shim* from the given execution parameters

**Note** Requires: all parameters are `executor_parameters`, different parameter types can't be duplicated

**Return** The new *parallel\_policy\_shim*

### Template Parameters

- Parameters: The type of the executor parameters to associate with this execution policy.

### Parameters

- **params:** [in] The executor parameters to use for the execution of the parallel algorithm the returned execution policy is used with.

**`executor_type &executor()`**

Return the associated executor object.

**`constexpr executor_type const &executor() const`**

Return the associated executor object.

**`executor_parameters_type &parameters()`**

Return the associated executor parameters object.

**`constexpr executor_parameters_type const &parameters() const`**

Return the associated executor parameters object.

### Private Functions

 policy

using execution_category = sequenced_execution_tag
 The category of the execution agents created by this execution policy.
```

## Public Functions

```
constexpr sequenced_task_policy operator()(task_policy_tag) const
 Create a new sequenced_task_policy.
```

**Return** The new *sequenced\_task\_policy*

**Parameters**

- **tag:** [in] Specify that the corresponding asynchronous execution policy should be used

```
constexpr decltype(auto) operator() (non_task_policy_tag) const
Create a new sequenced_policy from itself.
```

**Return** The new *sequenced\_policy*

```
template<typename Executor>
constexpr decltype(auto) on(Executor &&exec) const
Create a new sequenced_policy from the given executor
```

**Note** Requires: `is_executor<Executor>::value` is true

**Return** The new *sequenced\_policy*

**Template Parameters**

- `Executor`: The type of the executor to associate with this execution policy.

**Parameters**

- `exec`: [in] The executor to use for the execution of the parallel algorithm the returned execution policy is used with.

```
template<typename ...Parameters>
constexpr decltype(auto) with(Parameters&&... params) const
Create a new sequenced_policy from the given execution parameters
```

**Note** Requires: all parameters are `executor_parameters`, different parameter types can't be duplicated

**Return** The new *sequenced\_policy*

**Template Parameters**

- `Parameters`: The type of the executor parameters to associate with this execution policy.

**Parameters**

- `params`: [in] The executor parameters to use for the execution of the parallel algorithm the returned execution policy is used with.

```
executor_type &executor()
```

Return the associated executor object.

```
constexpr executor_type const &executor() const
Return the associated executor object.
```

```
executor_parameters_type ¶meters()
```

Return the associated executor parameters object.

```
constexpr executor_parameters_type const ¶meters() const
Return the associated executor parameters object.
```

### class fork\_join\_executor

#include <fork\_join\_executor.hpp> An executor with fork-join (blocking) semantics.

The *fork\_join\_executor* creates on construction a set of worker threads that are kept alive for the duration of the executor. Copying the executor has reference semantics, i.e. copies of a *fork\_join\_executor* hold a reference to the worker threads of the original instance. Scheduling work through the executor concurrently from different threads is undefined behaviour.

The executor keeps a set of worker threads alive for the lifetime of the executor, meaning other work will not be executed while the executor is busy or waiting for work. The executor has a customizable delay after which it will yield to other work. Since starting and resuming the worker threads is a slow operation the executor should be reused whenever possible for multiple adjacent parallel algorithms or invocations of bulk\_(a)sync\_execute.

## Public Types

### `enum loop_schedule`

Type of loop schedule for use with the `fork_join_executor`. `loop_schedule::static_` implies no work-stealing; `loop_schedule::dynamic` allows stealing when a worker has finished its local work.

*Values:*

`static_`  
`dynamic`

## Public Functions

```
fork_join_executor(threads::thread_priority priority = threads::thread_priority::high,
 threads::thread_stacksize stacksize =
 threads::thread_stacksize::small_, loop_schedule schedule =
 loop_schedule::static_, std::chrono::nanoseconds yield_delay =
 std::chrono::milliseconds(1))
```

Construct a `fork_join_executor`.

### Parameters

- `priority`: The priority of the worker threads.
- `stacksize`: The stacksize of the worker threads.
- `schedule`: The loop schedule of the parallel regions.
- `yield_delay`: The time after which the executor yields to other work if it hasn't received any new work for bulk execution.

## filesystem

The contents of this module can be included with the header `hpx/modules/filesystem.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/filesystem.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

This file provides a compatibility layer using Boost.Filesystem for the C++17 filesystem library. It is *not* intended to be a complete compatibility layer. It only contains functions required by the HPX codebase. It also provides some functions only available in Boost.Filesystem when using C++17 filesystem.

```
namespace hpx
```

```
namespace filesystem
```

## Functions

```
path initial_path()
std::string basename(path const &p)
path canonical(path const &p, path const &base)
path canonical(path const &p, path const &base, std::error_code &ec)
```

## format

The contents of this module can be included with the header `hpx/modules/format.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/format.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

namespace hpx
```

```
namespace util
```

## Functions

```
template<typename F, typename ...Ts>
constexpr util::invoke_result<F, Ts...>::type invoke (F &&f, Ts&&... vs)
 Invokes the given callable object f with the content of the argument pack vs
```

**Return** The result of the callable object when it's called with the given argument types.

**Note** This function is similar to `std::invoke` (C++17)

### Parameters

- `f`: Requires to be a callable object. If `f` is a member function pointer, the first argument in the pack will be treated as the callee (this object).
- `vs`: An arbitrary pack of arguments

### Exceptions

- `std::exception`: like objects thrown by call to object `f` with the argument types `vs`.

```
template<typename R, typename F, typename ...Ts>
constexpr R invoke_r (F &&f, Ts&&... vs)
```

### Template Parameters

- `R`: The result type of the function when it's called with the content of the given argument types `vs`.

```
namespace functional
```

```
struct invoke
```

## Public Functions

```
template<typename F, typename ...Ts>

namespace hpx

namespace util
```

## Functions

```
template<typename F, typename Tuple>
constexpr detail::invoke_fused_result<F, Tuple>::type invoke_fused(F &&f, Tuple &&t)
 Invokes the given callable object f with the content of the sequenced type t (tuples, pairs)
```

**Return** The result of the callable object when it's called with the content of the given sequenced type.

**Note** This function is similar to `std::apply` (C++17)

### Parameters

- `f`: Must be a callable object. If `f` is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- `t`: A type whose contents are accessible through a call to `hpx::get`.

### Exceptions

- `std::exception`: like objects thrown by call to object `f` with the arguments contained in the sequenceable type `t`.

```
template<typename R, typename F, typename Tuple>
constexpr R invoke_fused_r(F &&f, Tuple &&t)
```

### Template Parameters

- `R`: The result type of the function when it's called with the content of the given sequenced type.

```
namespace hpx
```

```
namespace util
```

```

```
namespace hpx
```

```
namespace util
```

```
class jenkins_hash
```

#include <jenkins\_hash.hpp> The `jenkins_hash` class encapsulates a hash calculation function published by Bob Jenkins here: <http://burtleburtle.net/bob/hash>

## Public Types

```
enum seedenum
```

The `seedenum` is used as a dummy parameter to distinguish the different constructors

*Values:*

```
seed = 1
```

```
typedef std::uint32_t size_type
```

this is the type representing the result of this hash

## Public Functions

```
jenkins_hash()
 constructors and destructor

jenkins_hash(size_type size)

jenkins_hash(size_type seedval, seedenum)

~jenkins_hash()

size_type operator()(std::string const &key) const
 calculate the hash value for the given key

size_type operator()(char const *key) const

bool reset(size_type size)
 re-seed the hash generator

void set_seed(size_type seedval)
 initialize the hash generator to a specific seed

void swap(jenkins_hash &rhs)
 support for std::swap
```

## Protected Functions

```
size_type hash(const char *k, std::size_t length) const
```

## Private Members

## io\_service

The contents of this module can be included with the header `hpx/modules/io_service.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/io_service.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```
namespace hpx
```

```
 namespace util
```

```
 class io_service_pool
```

```
 #include <io_service_pool.hpp> A pool of io_service objects.
```

### Public Functions

```
 HPX_NON_COPYABLE (io_service_pool)
```

```
 io_service_pool (std::size_t pool_size = 2, threads::policies::callback_notifier const
 ¬ifier = threads::policies::callback_notifier(), char const
 *pool_name = "", char const *name_postfix = "")
```

Construct the io\_service pool.

#### Parameters

- `pool_size`: [in] The number of threads to run to serve incoming requests
- `start_thread`: [in]

```
 io_service_pool (threads::policies::callback_notifier const ¬ifier, char const
 *pool_name = "", char const *name_postfix = "")
```

Construct the io\_service pool.

#### Parameters

- `start_thread`: [in]

```
~io_service_pool ()
```

```
bool run (bool join_threads = true, barrier *startup = nullptr)
```

Run all io\_service objects in the pool. If `join_threads` is true this will also wait for all threads to complete

```
bool run (std::size_t num_threads, bool join_threads = true, barrier *startup = nullptr)
```

Run all io\_service objects in the pool. If `join_threads` is true this will also wait for all threads to complete

```
void stop ()
```

Stop all io\_service objects in the pool.

```
void join ()
```

Join all io\_service threads in the pool.

```
void clear ()
```

Clear all internal data structures.

---

```

void wait()
 Wait for all work to be done.

bool stopped()

asio::io_context &get_io_service(int index = -1)
 Get an io_service to use.

std::thread &get_os_thread_handle(std::size_t thread_num)
 access underlying thread handle

std::size_t size() const
 Get number of threads associated with this I/O service.

void thread_run(std::size_t index, barrier *startup = nullptr)
 Activate the thread index for this thread pool.

char const *get_name() const
 Return name of this pool.

void init(std::size_t pool_size)

```

## Protected Functions

```

bool run_locked(std::size_t num_threads, bool join_threads, barrier *startup)
void stop_locked()
void join_locked()
void clear_locked()
void wait_locked()

```

## Private Types

```

using io_service_ptr = std::unique_ptr<asio::io_context>
using work_type = asio::io_context::work

```

## Private Functions

```
work_type initialize_work(asio::io_context &io_service)
```

## Private Members

```

std::mutex mtx_
std::vector<io_service_ptr> io_services_
 The pool of io_services.
std::vector<std::thread> threads_
std::vector<work_type> work_
 The work that keeps the io_services running.

```

```
std::size_t next_io_service_
 The next io_service to use for a connection.

bool stopped_
 set to true if stopped

std::size_t pool_size_
 initial number of OS threads to execute in this pool

threads::policies::callback_notifier const ¬ifier_
 call this for each thread start/stop

char const *pool_name_

char const *pool_name_postfix_

bool waiting_
 Set to true if waiting for work to finish.

std::unique_ptr<barrier> wait_barrier_

std::unique_ptr<barrier> continue_barrier_
```

## iterator\_support

The contents of this module can be included with the header `hpx/modules/iterator_support.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/iterator_support.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX API*.

## logging

The contents of this module can be included with the header `hpx/modules/logging.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/logging.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```
namespace hpx
```

```
namespace util
```

```
namespace logging
```

## Enums

```
enum level
```

Handling levels - classes that can hold and/or deal with levels.

- filters and level holders

By default we have these levels:

```
- debug (smallest level),
- info,
- warning ,
- error ,
- fatal (highest level)
```

Depending on which level is enabled for your application, some messages will reach the log: those messages having at least that level. For instance, if info level is enabled, all logged messages will reach the log. If warning level is enabled, all messages are logged, but the warnings. If debug level is enabled, messages that have levels debug, error, fatal will be logged.

*Values:*

```
disable_all = static_cast<unsigned int>(-1)
```

```
enable_all = 0
debug = 1000
info = 2000
warning = 3000
error = 4000
fatal = 5000
always = 6000
```

## Functions

```
void format_value (std::ostream &os, boost::string_ref spec, level value)
```

Include this file when you're using the logging lib, but don't necessarily want to use formatters and destinations. If you want to use formatters and destinations, then you can include this one instead:

```
#include <hpx/logging/format.hpp>
```

```
namespace hpx
```

```
namespace util
```

```
namespace logging
```

### namespace destination

Destination is a manipulator. It contains a place where the message, after being formatted, is to be written to.

Some viable destinations are : *the console, a file, a socket, etc.*

#### struct manipulator

```
#include <manipulator.hpp>
```

What to use as base class, for your destination classes.

Subclassed by *hpx::util::logging::destination::cerr, hpx::util::logging::destination::cout, hpx::util::logging::destination::dbg\_window, hpx::util::logging::destination::file, hpx::util::logging::destination::stream*

## Public Functions

```
virtual void operator() (message const&) = 0
```

```
virtual void configure (std::string const&)
```

Override this if you want to allow configuration through scripting.

That is, this allows configuration of your manipulator at run-time.

```
virtual ~manipulator()
```

## Protected Functions

**manipulator()**

**namespace formatter**

Formatter is a manipulator. It allows you to format the message before writing it to the destination(s)

Examples of formatters are : prepend the time, prepend high-precision time, prepend the index of the message, etc.

**struct manipulator**

*#include <manipulator.hpp>* What to use as base class, for your formatter classes.

Subclassed by *hpx::util::logging::formatter::high\_precision\_time, hpx::util::logging::formatter::idx, hpx::util::logging::formatter::thread\_id*

## Public Functions

**virtual void operator() (std::ostream&) const = 0**

**virtual void configure (std::string const&)**

Override this if you want to allow configuration through scripting.

That is, this allows configuration of your manipulator at run-time.

**virtual ~manipulator()**

## Protected Functions

**manipulator()**

## Friends

**void format\_value (std::ostream &os, boost::string\_ref, manipulator const &value)**

**namespace hpx**

**namespace util**

**namespace logging**

**class message**

*#include <message.hpp>* Optimizes the formatting for prepending and/or appending strings to the original message.

It keeps all the modified message in one string. Useful if some formatter needs to access the whole string at once.

reserve() - the size that is reserved for prepending (similar to string::reserve function)

Note : as strings are prepended, reserve() shrinks.

## Public Functions

```
message()

message (std::stringstream msg)
Parameters
• msg: - the message that is originally cached

message (message &&other)

template<typename T>
message &operator<< (T &&v)

template<typename ...Args>
message &format (boost::string_ref format_str, Args const&... args)

std::string const &full_string () const
 returns the full string

bool empty () const
```

## Private Members

```
std::stringstream m_str
bool m_full_msg_computed
std::string m_full_msg
```

## Friends

```
std::ostream &operator<< (std::ostream &os, message const &value)

namespace hpx

namespace util

namespace logging
```

### **namespace destination**

Destination is a manipulator. It contains a place where the message, after being formatted, is to be written to.

Some viable destinations are : *the console, a file, a socket, etc.*

```
struct cerr : public hpx::util::logging::destination::manipulator
 #include <destinations.hpp> Writes the string to cerr.
```

## Public Functions

`~cerr()`

## Public Static Functions

`static std::unique_ptr<cerr> make()`

## Protected Functions

`cerr()`

`struct cout : public hpx::util::logging::destination::manipulator`  
`#include <destinations.hpp>` Writes the string to console.

## Public Functions

`~cout()`

## Public Static Functions

`static std::unique_ptr<cout> make()`

## Protected Functions

`cout()`

`struct dbg_window : public hpx::util::logging::destination::manipulator`  
`#include <destinations.hpp>` Writes the string to output debug window.

For non-Windows systems, this is the console.

## Public Functions

`~dbg_window()`

## Public Static Functions

`static std::unique_ptr<dbg_window> make()`

## Protected Functions

```
 dbg_window()
struct file : public hpx::util::logging::destination::manipulator
 #include <destinations.hpp> Writes the string to a file.
```

## Public Functions

```
 ~file()
```

## Public Static Functions

```
 static std::unique_ptr<file> make (std::string const &file_name, file_settings set = {})
 constructs the file destination
```

### Parameters

- `file_name`: name of the file
- `set`: [optional] file settings - see `file_settings` class, and `dealing_with_flags`

## Protected Functions

```
 file (std::string const &file_name, file_settings set)
```

## Protected Attributes

```
 std::string name
 file_settings settings
 struct file_settings
 #include <destinations.hpp> settings for when constructing a file class. To see how it's used,
 see dealing_with_flags.
```

## Public Functions

```
 file_settings ()
```

## Public Members

```
 bool flush_each_time : 1
 if true (default), flushes after each write
 bool initial_overwrite : 1
 bool do_append : 1
 std::ios_base::openmode extra_flags
 just in case you have some extra flags to pass, when opening the file
```

```
struct stream : public hpx::util::logging::destination::manipulator
#include <destinations.hpp> writes to stream.
```

**Note** : The stream must outlive this object! Or, *clear()* the stream, before the stream is deleted.

## Public Functions

```
~stream()
void set_stream(std::ostream *stream_ptr)
 resets the stream. Further output will be written to this stream
void clear()
 clears the stream. Further output will be ignored
```

## Public Static Functions

```
static std::unique_ptr<stream> make (std::ostream *stream_ptr)
```

## Protected Functions

```
stream (std::ostream *stream_ptr)
```

## Protected Attributes

```
std::ostream *ptr
```

```
namespace hpx
```

```
namespace util
```

```
namespace logging
```

### **namespace formatter**

Formatter is a manipulator. It allows you to format the message before writing it to the destination(s)

Examples of formatters are : prepend the time, prepend high-precision time, prepend the index of the message, etc.

```
struct high_precision_time : public hpx::util::logging::formatter::manipulator
#include <formatters.hpp> Prefixes the message with a high-precision time (. You pass the
format string at construction.
```

```
#include <hpx/logging/format/formatter/high_precision_time.hpp>
```

Internally, it uses hpx::util::date\_time::microsec\_time\_clock. So, our precision matches this class.

The format can contain escape sequences: \$dd - day, 2 digits \$MM - month, 2 digits \$yy - year, 2 digits \$yyyy - year, 4 digits \$hh - hour, 2 digits \$mm - minute, 2 digits \$ss - second, 2 digits \$mili - milliseconds \$micro - microseconds (if the high precision clock allows; otherwise, it pads zeros) \$nano - nanoseconds (if the high precision clock allows; otherwise, it pads zeros)

Example:

```
high_precision_time("$mm:$ss:$micro");
```

### Parameters

- convert: [optional] In case there needs to be a conversion between std::(w)string and the string that holds your logged message. See convert\_format.

### Public Functions

```
~high_precision_time()
```

### Public Static Functions

```
static std::unique_ptr<high_precision_time> make(std::string const &format)
```

### Protected Functions

```
high_precision_time(std::string const &format)
```

```
struct idx : public hpx::util::logging::formatter::manipulator
#include <formatters.hpp> prefixes each message with an index.
```

Example:

```
L_ << "my message";
L_ << "my 2nd message";
```

This will output something similar to:

```
[1] my message
[2] my 2nd message
```

## Public Functions

`~idx()`

## Public Static Functions

`static std::unique_ptr<idx> make()`

## Protected Functions

`idx()`

`struct thread_id : public hpx::util::logging::formatter::manipulator`  
`#include <formatters.hpp>` Writes the `thread_id` to the log.

### Parameters

- `convert`: [optional] In case there needs to be a conversion between `std::(w)string` and the string that holds your logged message. See `convert_format`.

## Public Functions

`~thread_id()`

## Public Static Functions

`static std::unique_ptr<thread_id> make()`

## Protected Functions

`thread_id()`

`namespace hpx`

`namespace util`

`namespace logging`

`namespace writer`

`struct named_write`

`#include <named_write.hpp>` Composed of a named formatter and a named destinations. Thus, you can specify the formatting and destinations as strings.

`#include <hpx/logging/format/named_write.hpp>`

Contains a very easy interface for using formatters and destinations:

- at construction, specify 2 params: the formatter string and the destinations string
- Setting the formatters and destinations to write to is extremely simple:

```
// Set the formatters (first param) and destinatins (second step) in
// one step
g_l() ->writer().write("%time%($hh:$mm.$ss.$mili) [%idx%] |\n",
 "cout file(out.txt) debug");

// set the formatter(s)
g_l() ->writer().format("%time%($hh:$mm.$ss.$mili) [%idx%] |\n");

// set the destination(s)
g_l() ->writer().destination("cout file(out.txt) debug");
```

## Public Functions

**named\_write()**

**void format (std::string const &format\_str)**

sets the format string: what should be before, and what after the original message, separated by “|”

Example: “[%idx%] |\n” - this writes “[%idx%] ” before the message, and “\n” after the message

If “|” is not present, the whole message is prepended to the message

**void destination (std::string const &destination\_str)**

sets the destinations string - where should logged messages be outputted

**void write (std::string const &format\_str, std::string const &destination\_str)**

Specifies the formats and destinations in one step.

**void operator () (message const &msg) const**

template<typename **Formatter**>

**void set\_formatter (std::string const &name, Formatter fmt)**

Replaces a formatter from the named formatter.

You can use this, for instance, when you want to share a formatter between multiple named writers.

template<typename **Formatter**, typename ...**Args**>

**void set\_formatter (std::string const &name, Args&&... args)**

template<typename **Destination**>

**void set\_destination (std::string const &name, Destination dest)**

Replaces a destination from the named destination.

You can use this, for instance, when you want to share a destination between multiple named writers.

template<typename **Destination**, typename ...**Args**>

**void set\_destination (std::string const &name, Args&&... args)**

## Private Functions

## mpi\_base

The contents of this module can be included with the header `hpx/modules/mpi_base.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/mpi_base.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
struct mpi_environment
```

## Public Static Functions

```
static bool check_mpi_environment(runtime_configuration const &cfg)
```

## pack\_traversal

The contents of this module can be included with the header `hpx/modules/pack_traversal.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/pack_traversal.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

## Functions

```
template<typename Mapper, typename... T><unspecified> hpx::util::map_pack(Mapper &
Maps the pack with the given mapper.
```

This function tries to visit all plain elements which may be wrapped in:

- homogeneous containers (`std::vector`, `std::list`)
- heterogeneous containers (`hpx::tuple`, `std::pair`, `std::array`) and re-assembles the pack with the result of the mapper. Mapping from one type to a different one is supported.

Elements that aren't accepted by the mapper are routed through and preserved through the hierarchy.

```
// Maps all integers to floats
map_pack([](int value) {
 return float(value);
},
1, hpx::make_tuple(2, std::vector<int>{3, 4}), 5);
```

**Return** The mapped element or in case the pack contains multiple elements, the pack is wrapped into a `hpx::tuple`.

#### Exceptions

- `std::exception`: like objects which are thrown by an invocation to the mapper.

#### Parameters

- `mapper`: A callable object, which accept an arbitrary type and maps it to another type or the same one.
- `pack`: An arbitrary variadic pack which may contain any type.

`namespace hpx`

`namespace util`

### Functions

```
template<typename Visitor, typename ...T>
auto traverse_pack_async(Visitor &&visitor, T&&... pack)
 Traverses the pack with the given visitor in an asynchronous way.
```

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```
struct my_async_visitor
{
 template <typename T>
 bool operator()(async_traverse_visit_tag, T&& element)
 {
 return true;
 }

 template <typename T, typename N>
 void operator()(async_traverse_detach_tag, T&& element, N&& next)
 {
 }

 template <typename T>
 void operator()(async_traverse_complete_tag, T&& pack)
 {
 }
};
```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

**Return** A `hpx::intrusive_ptr` that references an instance of the given visitor object.

### Parameters

- visitor: A visitor object which provides the three `operator()` overloads that were described above. Additionally the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should must have a virtual destructor!
- pack: The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.

```
template<typename Allocator, typename Visitor, typename ...T>
auto traverse_pack_async_allocator(Allocator const &alloc, Visitor &&visitor,
 T&&... pack)
```

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```
struct my_async_visitor
{
 template <typename T>
 bool operator() (async_traverse_visit_tag, T&& element)
 {
 return true;
 }

 template <typename T, typename N>
 void operator() (async_traverse_detach_tag, T&& element, N&& next)
 {
 }

 template <typename T>
 void operator() (async_traverse_complete_tag, T&& pack)
 {
 }
};
```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

**Return** A `hpx::intrusive_ptr` that references an instance of the given visitor object.

### Parameters

- visitor: A visitor object which provides the three `operator()` overloads that were described above. Additionally the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should must have a virtual destructor!
- pack: The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.
- alloc: Allocator instance to use to create the traversal frame.

```
namespace hpx
```

## Functions

```
template<typename ...Args>
auto unwrap (Args&&... args)
```

A helper function for retrieving the actual result of any hpx::future like type which is wrapped in an arbitrary way.

Unwraps the given pack of arguments, so that any hpx::future object is replaced by its future result type in the argument pack:

- hpx::future<int> -> int
- hpx::future<std::vector<float>> -> std::vector<float>
- std::vector<future<float>> -> std::vector<float>

The function is capable of unwrapping hpx::future like objects that are wrapped inside any container or tuple like type, see hpx::util::map\_pack() for a detailed description about which surrounding types are supported. Non hpx::future like types are permitted as arguments and passed through.

```
// Single arguments
int i1 = hpx::unwrap(hpx::make_ready_future(0));

// Multiple arguments
hpx::tuple<int, int> i2 =
 hpx::unwrap(hpx::make_ready_future(1),
 hpx::make_ready_future(2));
```

**Note** This function unwraps the given arguments until the first traversed nested hpx::future which corresponds to an unwrapping depth of one. See hpx::unwrap\_n() for a function which unwraps the given arguments to a particular depth or hpx::unwrap\_all() that unwraps all future like objects recursively which are contained in the arguments.

**Return** Depending on the count of arguments this function returns a hpx::tuple containing the unwrapped arguments if multiple arguments are given. In case the function is called with a single argument, the argument is unwrapped and returned.

### Parameters

- args: the arguments that are unwrapped which may contain any arbitrary future or non future type.

### Exceptions

- std::exception: like objects in case any of the given wrapped hpx::future objects were resolved through an exception. See hpx::future::get() for details.

```
template<std::size_t Depth, typename ...Args>
auto unwrap_n (Args&&... args)
```

An alternative version of hpx::unwrap(), which unwraps the given arguments to a certain depth of hpx::future like objects.

See unwrap for a detailed description.

### Template Parameters

- Depth: The count of hpx::future like objects which are unwrapped maximally.

```
template<typename ...Args>
auto unwrap_all(Args&&... args)
```

An alterntive version of hpx::unwrap(), which unwraps the given arguments recursively so that all contained hpx::future like objects are replaced by their actual value.

See hpx::unwrap() for a detailed description.

```
template<typename T>
auto unwrapping(T &&callable)
```

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap() function and then passes the result to the given callable object.

```
auto callable = hpx::unwrapping([](int left, int right) {
 return left + right;
});

int i1 = callable(hpx::make_ready_future(1),
 hpx::make_ready_future(2));
```

See hpx::unwrap() for a detailed description.

### Parameters

- **callable**: the callable object which which is called with the result of the corresponding unwrap function.

```
template<std::size_t Depth, typename T>
auto unwrapping_n(T &&callable)
```

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap\_n() function and then passes the result to the given callable object.

See hpx::unwrapping() for a detailed description.

```
template<typename T>
auto unwrapping_all(T &&callable)
```

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap\_all() function and then passes the result to the given callable object.

See hpx::unwrapping() for a detailed description.

### namespace functional

```
struct unwrap
```

#include <unwrap.hpp> A helper function object for functionally invoking hpx::unwrap. For more information please refer to its documentation.

```
struct unwrap_all
```

#include <unwrap.hpp> A helper function object for functionally invoking hpx::unwrap\_all. For more information please refer to its documentation.

```
template<std::size_t Depth>
```

```
struct unwrap_n
```

#include <unwrap.hpp> A helper function object for functionally invoking hpx::unwrap\_n. For more information please refer to its documentation.

### prefix

The contents of this module can be included with the header `hpx/modules/prefix.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/prefix.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

### Defines

```
HPX_BASE_DIR_NAME
HPX_DEFAULT_INI_PATH
HPX_DEFAULT_INI_FILE
HPX_DEFAULT_COMPONENT_PATH
namespace hpx

namespace util
```

### Functions

```
void set_hpx_prefix(const char *prefix)
char const *hpx_prefix()
std::string find_prefix(std::string const &library = "hpx")
std::string find_prefixes(std::string const &suffix, std::string const &library = "hpx")
std::string get_executable_filename(char const *argv0 = nullptr)
std::string get_executable_prefix(char const *argv0 = nullptr)
```

## preprocessor

The contents of this module can be included with the header `hpx/modules/preprocessor.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/preprocessor.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

### Defines

#### `HPX_PP_CAT (A, B)`

Concatenates the tokens A and B into a single token. Evaluates to AB

##### Parameters

- A: First token
- B: Second token

### Defines

#### `HPX_PP_EXPAND (X)`

The `HPX_PP_EXPAND` macro performs a double macro-expansion on its argument. This macro can be used to produce a delayed preprocessor expansion.

##### Parameters

- X: Token to be expanded twice

Example:

```
#define MACRO(a, b, c) (a) (b) (c)
#define ARGS() (1, 2, 3)

HPX_PP_EXPAND (MACRO ARGS()) // expands to (1) (2) (3)
```

### Defines

#### `HPX_PP_IDENTITY (...)`

### Defines

#### `HPX_PP_NARGS (...)`

Expands to the number of arguments passed in

Example Usage:

```
HPX_PP_NARGS (hpx, pp, nargs)
HPX_PP_NARGS (hpx, pp)
HPX_PP_NARGS (hpx)
```

##### Parameters

- ...: The variadic number of arguments

Expands to:

```
3
2
1
```

## Defines

### **HPX\_PP\_STRINGIZE (X)**

The `HPX_PP_STRINGIZE` macro stringizes its argument after it has been expanded.

The passed argument X will expand to "X". Note that the stringizing operator (#) prevents arguments from expanding. This macro circumvents this shortcoming.

#### Parameters

- X: The text to be converted to a string literal

## Defines

### **HPX\_PP\_STRIP\_PARENS (X)**

For any symbol X, this macro returns the same symbol from which potential outer parens have been removed. If no outer parens are found, this macros evaluates to X itself without error.

The original implementation of this macro is from Steven Watanbe as shown in <http://boost.2283326.n4.nabble.com/preprocessor-removing-parentheses-td2591973.html#a2591976>

```
HPX_PP_STRIP_PARENS (no_parens)
HPX_PP_STRIP_PARENS ((with_parens))
```

#### Example Usage:

#### Parameters

- X: Symbol to strip parens from

This produces the following output

```
no_parens
with_parens
```

## program\_options

The contents of this module can be included with the header `hpx/modules/program_options.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/program_options.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```
namespace hpx
```

```
namespace program_options

namespace command_line_style
```

## Enums

### **enum style\_t**

Various possible styles of options.

There are “long” options, which start with “–” and “short”, which start with either “-” or “/”. Both kinds can be allowed or disallowed, see allow\_long and allow\_short. The allowed character for short options is also configurable.

Option’s value can be specified in the same token as name (“–foo=bar”), or in the next token.

It’s possible to introduce long options by the same character as short options, see allow\_long\_disguise.

Finally, guessing (specifying only prefix of option) and case insensitive processing are supported.

*Values:*

#### **allow\_long = 1**

Allow “–long\_name” style.

#### **allow\_short = allow\_long << 1**

Allow “-<single character” style.

#### **allow\_dash\_for\_short = allow\_short << 1**

Allow “-” in short options.

#### **allow\_slash\_for\_short = allow\_dash\_for\_short << 1**

Allow “/” in short options.

#### **long\_allow\_adjacent = allow\_slash\_for\_short << 1**

Allow option parameter in the same token for long option, like in

```
--foo=10
```

#### **long\_allow\_next = long\_allow\_adjacent << 1**

Allow option parameter in the next token for long options.

#### **short\_allow\_adjacent = long\_allow\_next << 1**

Allow option parameter in the same token for short options.

#### **short\_allow\_next = short\_allow\_adjacent << 1**

Allow option parameter in the next token for short options.

#### **allow\_sticky = short\_allow\_next << 1**

Allow to merge several short options together, so that “-s -k” become “-sk”. All of the options but last should accept no parameter. For example, if “-s” accept a parameter, then “k” will be taken as parameter, not another short option. Dos-style short options cannot be sticky.

#### **allow\_guessing = allow\_sticky << 1**

Allow abbreviated spellings for long options, if they unambiguously identify long option. No long option name should be prefix of other long option name if guessing is in effect.

#### **long\_case\_insensitive = allow\_guessing << 1**

Ignore the difference in case for long options.

```
short_case_insensitive = long_case_insensitive << 1
Ignore the difference in case for short options.

case_insensitive = (long_case_insensitive | short_case_insensitive)
Ignore the difference in case for all options.

allow_long_disguise = short_case_insensitive << 1
Allow long options with single option starting character, e.g -fоо=10

unix_style = (allow_short | short_allow_adjacent | short_allow_next | allow_long | long_allow_adjacent | long
The more-or-less traditional unix style.

default_style = unix_style
The default style.

namespace hpx

namespace program_options

template<class Derived, class ValueType>
```

```
class eof_iterator : public util::iterator_facade<Derived, ValueType const, std::forward_iterator_tag>
#include <eof_iterator.hpp> The 'eof_iterator' class is useful for constructing forward iterators in
cases where iterator extract data from some source and it's easy to detect 'eof' – i.e. the situation
where there's no data. One apparent example is reading lines from a file.
```

Implementing such iterators using ‘iterator\_facade’ directly would require to create class with three core operation, a couple of constructors. When using ‘eof\_iterator’, the derived class should define only one method to get new value, plus a couple of constructors.

The basic idea is that iterator has ‘eof’ bit. Two iterators are equal only if both have their ‘eof’ bits set. The ‘get’ method either obtains the new value or sets the ‘eof’ bit.

Specifically, derived class should define:

1. A default constructor, which creates iterator with ‘eof’ bit set. The constructor body should call ‘found\_eof’ method defined here.
2. Some other constructor. It should initialize some ‘data pointer’ used in iterator operation and then call ‘get’.
3. The ‘get’ method. It should operate this way:
  - look at some ‘data pointer’ to see if new element is available; if not, it should call ‘found\_eof’.
  - extract new element and store it at location returned by the ‘value’ method.
  - advance the data pointer.

Essentially, the ‘get’ method has the functionality of both ‘increment’ and ‘dereference’. It’s very good for the cases where data extraction implicitly moves data pointer, like for stream operation.

## Public Functions

`eof_iterator()`

## Protected Functions

`ValueType &value()`

Returns the reference which should be used by derived class to store the next value.

`void found_eof()`

Should be called by derived class to indicate that it can’t produce next element.

## Private Functions

`void increment()`

`bool equal (const eof_iterator &other) const`

`const ValueType &dereference () const`

### Private Members

error (const std::string &xwhat)

class error_with_no_option_name : public hpx::program_options::error_with_option_name

#include <errors.hpp> Base class of un-parsable options, when the desired option cannot be identified.
```

It makes no sense to have an option name, when we can't match an option to the parameter

Having this a part of the *error\_with\_option\_name* hierarchy makes error handling a lot easier, even if the name indicates some sort of conceptual dissonance!

Subclassed by *hpx::program\_options::ambiguous\_option*, *hpx::program\_options::unknown\_option*

## Public Functions

```
error_with_no_option_name (const std::string &template_, const std::string &original_token = "")

void set_option_name (const std::string&)

 Does NOT set option name, because no option name makes sense

~error_with_no_option_name ()
```

```
class error_with_option_name : public hpx::program_options::error

#include <errors.hpp> Base class for most exceptions in the library.
```

Substitutes the values for the parameter name placeholders in the template to create the human readable error message

Placeholders are surrounded by % signs: example% Poor man's version of boost::format

If a parameter name is absent, perform default substitutions instead so ugly placeholders are never left in-place.

Options are displayed in “canonical” form This is the most unambiguous form of the *parsed option name* and would correspond to *option\_description::format\_name()* i.e. what is shown by *print\_usage()*

The “canonical” form depends on whether the option is specified in short or long form, using dashes or slashes or without a prefix (from a configuration file)

## Public Functions

```
invalid_option_value(const std::string &value)
invalid_option_value(const std::wstring &value)

class invalid_syntax : public hpx::program_options::error_with_option_name
 #include <errors.hpp> Class thrown when there's syntax error either for command line or config file
 options. See derived children for concrete classes.

Subclassed by hpx::program_options::invalid_command_line_syntax,
hpx::program_options::invalid_config_file_syntax
```

## Public Types

```
enum kind_t
Values:
long_not_allowed = 30
long_adjacent_not_allowed
short_adjacent_not_allowed
empty_adjacent_parameter
missing_parameter
extra_parameter
unrecognized_line
```

## Public Functions

```
invalid_syntax(kind_t kind, const std::string &option_name = "", const std::string
&original_token = "", int option_style = 0)
~invalid_syntax()
kind_t kind() const
virtual std::string tokens() const
 Convenience functions for backwards compatibility
```

## Protected Functions

```
std::string get_template(kind_t kind)
 Used to convert kind_t to a related error text
```

## Protected Attributes

`kind_t m_kind`

```
class multiple_occurrences : public hpx::program_options::error_with_option_name
#include <errors.hpp> Class thrown when there are several occurrences of an option, but user called a method which cannot return them all.
```

## Public Functions

`multiple_occurrences()`

`~multiple_occurrences()`

std::string get_template (kind_t kind)
 Used to convert kind_t to a related error text
```

## Protected Attributes

```
kind_t m_kind

namespace hpx

namespace program_options
```

## TypeDefs

```
using option = basic_option<char>
using woption = basic_option<wchar_t>

template<class Char>
class basic_option
 #include <option.hpp> Option found in input source. Contains a key and a value. The key, in turn, can be a string (name of an option), or an integer (position in input source) – in case no name is specified. The latter is only possible for command line. The template parameter specifies the type of char used for storing the option's value.
```

## Public Functions

```
basic_option()
basic_option(const std::string &xstring_key, const std::vector<std::string> &xvalue)
```

## Public Members

*std::string* **string\_key**

String key of this option. Intentionally independent of the template parameter.

*int* **position\_key**

Position key of this option. All options without an explicit name are sequentially numbered starting from 0. If an option has explicit name, ‘position\_key’ is equal to -1. It is possible that both position\_key and string\_key is specified, in case name is implicitly added.

*std::vector<std::basic\_string<Char>>* **value**

Option's value

*std::vector<std::basic\_string<Char>>* **original\_tokens**

The original unchanged tokens this option was created from.

**bool unregistered**

True if option was not recognized. In that case, ‘string\_key’ and ‘value’ are results of purely syntactic parsing of source. The original tokens can be recovered from the “original\_tokens” member.

**bool case\_insensitive**

True if string\_key has to be handled case insensitive.

```
namespace hpx
```

```
namespace program_options
```

```
class duplicate_option_error : public hpx::program_options::error
#include <options_description.hpp> Class thrown when duplicate option description is found.
```

## Public Functions

```
duplicate_option_error(const std::string &xwhat)
```

```
class option_description
```

#include <options\_description.hpp> Describes one possible command line/config file option. There are two kinds of properties of an option. First describe it syntactically and are used only to validate input. Second affect interpretation of the option, for example default value for it or function that should be called when the value is finally known. Routines which perform parsing never use second kind of properties – they are side effect free.

See [options\\_description](#)

## Public Types

```
enum match_result
```

Values:

```
no_match
```

```
full_match
```

```
approximate_match
```

## Public Functions

```
option_description()
```

```
option_description(const char *name, const value_semantic *s)
```

Initializes the object with the passed data.

Note: it would be nice to make the second parameter auto\_ptr, to explicitly pass ownership. Unfortunately, it's often needed to create objects of types derived from ‘value\_semantic’: [options\\_description](#) d; d.add\_options()("a", parameter<int>("n")->default\_value(1)); Here, the static type returned by ‘parameter’ should be derived from [value\\_semantic](#).

Alas, derived->base conversion for auto\_ptr does not really work, see <http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2000/n1232.pdf> [http://www.open-std.org/jtc1/sc22/wg21/docs/cwg\\_defects.html#84](http://www.open-std.org/jtc1/sc22/wg21/docs/cwg_defects.html#84)

So, we have to use plain old pointers. Besides, users are not expected to use the constructor directly.

The ‘name’ parameter is interpreted by the following rules:

- if there’s no “,” character in ‘name’, it specifies long name
- otherwise, the part before “,” specifies long name and the part after – short name.

```
option_description(const char *name, const value_semantic *s, const char *description)
```

Initializes the class with the passed data.

```
virtual ~option_description()
```

*match\_result* **match** (**const std::string &option**, **bool approx**, **bool long\_ignore\_case**, **bool short\_ignore\_case**) **const**

Given ‘option’, specified in the input source, returns ‘true’ if ‘option’ specifies \*this.

**const std::string &key (const std::string &option) const**

Returns the key that should identify the option, in particular in the *variables\_map* class. The ‘option’ parameter is the option spelling from the input source. If option name contains ‘\*’, returns ‘option’. If long name was specified, it’s the long name, otherwise it’s a short name with pre-pended ‘-’.

**std::string canonical\_display\_name (int canonical\_option\_style = 0) const**

Returns the canonical name for the option description to enable the user to recognize a matching option. 1) For short options ('-', '/'), returns the short name prefixed. 2) For long options ('/' / '-') returns the first long name prefixed 3) All other cases, returns the first long name (if present) or the short name, un-prefixed.

**const std::string &long\_name () const**

**const std::pair<const std::string\*, std::size\_t> long\_names () const**

**const std::string &description () const**

Explanation of this option.

**std::shared\_ptr<const value\_semantic> semantic () const**

Semantic of option’s value.

**std::string format\_name () const**

Returns the option name, formatted suitably for usage message.

**std::string format\_parameter () const**

Returns the parameter name and properties, formatted suitably for usage message.

## Private Functions

*option\_description &set\_names (const char \*name)*

## Private Members

**std::string m\_short\_name**

a one-character “switch” name - with its prefix, so that this is either empty or has length 2 (e.g. “-c”)

**std::vector<std::string> m\_long\_names**

one or more names by which this option may be specified on a command-line or in a config file, which are not a single-letter switch. The names here are *without* any prefix.

**std::string m\_description**

**std::shared\_ptr<const value\_semantic> m\_value\_semantic**

**class options\_description**

#include <options\_description.hpp> A set of option descriptions. This provides convenient interface for adding new option (the add\_options) method, and facilities to search for options by name.

See here for option adding interface discussion.

**See** *option\_description*

## Public Functions

```
options_description(unsigned line_length = m_default_line_length, unsigned
min_description_length = m_default_line_length / 2)
```

Creates the instance.

```
options_description(const std::string &caption, unsigned line_length =
m_default_line_length, unsigned min_description_length =
m_default_line_length / 2)
```

Creates the instance. The ‘caption’ parameter gives the name of this ‘options\_description’ instance. Primarily useful for output. The ‘description\_length’ specifies the number of columns that should be reserved for the description text; if the option text encroaches into this, then the description will start on the next line.

```
void add(std::shared_ptr<option_description> desc)
```

Adds new variable description. Throws duplicate\_variable\_error if either short or long name matches that of already present one.

```
options_description &add(const options_description &desc)
```

Adds a group of option description. This has the same effect as adding all option\_descriptions in ‘desc’ individually, except that output operator will show a separate group. Returns \*this.

```
std::size_t get_option_column_width() const
```

Find the maximum width of the option column, including options in groups.

```
options_description_easy_init add_options()
```

Returns an object of implementation-defined type suitable for adding options to *options\_description*. The returned object will have overloaded operator() with parameter type matching ‘option\_description’ constructors. Calling the operator will create new *option\_description* instance and add it.

```
const option_description &find(const std::string &name, bool approx, bool
long_ignore_case = false, bool short_ignore_case =
false) const
```

```
const option_description *find_nothrow(const std::string &name, bool approx,
bool long_ignore_case = false, bool
short_ignore_case = false) const
```

```
const std::vector<std::shared_ptr<option_description>> &options() const
```

```
void print(std::ostream &os, std::size_t width = 0) const
```

Outputs ‘desc’ to the specified stream, calling ‘f’ to output each *option\_description* element.

## Public Static Attributes

```
const unsigned m_default_line_length
```

## Private Types

```
using name2index_iterator = std::map<std::string, int>::const_iterator
using approximation_range = std::pair<name2index_iterator, name2index_iterator>
```

## Private Members

```
std::string m_caption
const std::size_t m_line_length
const std::size_t m_min_description_length
std::vector<std::shared_ptr<option_description>> m_options
std::vector<char> belong_to_group
std::vector<std::shared_ptr<options_description>> groups
```

## Friends

```
std::ostream &operator<< (std::ostream &os, const options_description &desc)
 Produces a human readable output of ‘desc’, listing options, their descriptions and allowed parameters. Other options_description instances previously passed to add will be output separately.
```

```
class options_description_easy_init
 #include <options_description.hpp> Class which provides convenient creation syntax to option_description.
```

## Public Functions

```
options_description_easy_init (options_description *owner)
options_description_easy_init &operator() (const char *name, const char *description)
options_description_easy_init &operator() (const char *name, const value_semantic *s)
options_description_easy_init &operator() (const char *name, const value_semantic *s,
 const char *description)
```

## Private Members

```
options_description *owner
namespace hpx
namespace program_options
```

## Typedefs

```
using parsed_options = basic_parsed_options<char>
using wparsed_options = basic_parsed_options<wchar_t>
using ext_parser = std::function<std::pair<std::string, std::string> (const std::string&) >
 Augments basic_parsed_options<wchar_t> with conversion from 'parsed_options'
using command_line_parser = basic_command_line_parser<char>
using wcommand_line_parser = basic_command_line_parser<wchar_t>
```

## Enums

### enum collect\_unrecognized\_mode

Controls if the ‘collect\_unregistered’ function should include positional options, or not.

Values:

```
include_positional
exclude_positional
```

## Functions

```
template<class Char>
basic_parsed_options<Char> parse_command_line (int argc, const Char *const argv[],
 const options_description&, int style
 = 0, std::function<std::pair<std::string,
 std::string>) const std::string&
> ext = ext_parser()Creates instance of ‘command_line_parser’, passes parameters to it, and returns
the result of calling the ‘run’ method.
```

```
template<class Char>
basic_parsed_options<Char> parse_config_file (std::basic_istream<Char>&, const
 const options_description&, bool al-
 allow_unregistered = false)
```

Parse a config file.

Read from given stream.

```
template<class Char = char>
basic_parsed_options<Char> parse_config_file (const char *filename, const
 const options_description&, bool al-
 allow_unregistered = false)
```

Parse a config file.

Read from file with the given name. The character type is passed to the file stream.

```
template<class Char>
std::vector<std::basic_string<Char>> collect_unrecognized (const
 std::vector<basic_option<Char>>
 &options, enum col-
 collect_unrecognized_mode
 mode)
```

Collects the original tokens for all named options with ‘unregistered’ flag set. If ‘mode’ is ‘include\_positional’ also collects all positional options. Returns the vector of original tokens for all collected options.

```
parsed_options parse_environment (const options_description&, const
 std::function<std::string> std::string
 > &name_mapper) Parse environment.
```

For each environment variable, the ‘name\_mapper’ function is called to obtain the option name. If it returns empty string, the variable is ignored.

This is done since naming of environment variables is typically different from the naming of command line options.

```
parsed_options parse_environment (const options_description&, const std::string &prefix)
```

Parse environment.

Takes all environment variables which start with ‘prefix’. The option name is obtained from variable name by removing the prefix and converting the remaining string into lower case.

```
parsed_options parse_environment (const options_description&, const char *prefix)
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts. This function exists to resolve ambiguity between the two above functions when second argument is of ‘char\*’ type. There’s implicit conversion to both std::function and string.

```
std::vector<std::string> split_unix (const std::string &cmdline, const std::string &separator
 = "\t", const std::string "e = "\"", const std::string
 &escape = "\\")
```

Splits a given string to a collection of single strings which can be passed to command\_line\_parser. The second parameter is used to specify a collection of possible separator chars used for splitting. The separator is defaulted to space “ “. Splitting is done in a unix style way, with respect to quotes “ ” and escape characters “ ”

```
std::vector<std::wstring> hpx::program_options::split_unix (const std::wstring & cmd)
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

```
template<class Char>
class basic_command_line_parser : private cmdline
#include <parsers.hpp> Command line parser.
```

The class allows one to specify all the information needed for parsing and to parse the command line. It is primarily needed to emulate named function parameters – a regular function with 5 parameters will be hard to use and creating overloads with a smaller number of parameters will be confusing.

For the most common case, the function parse\_command\_line is a better alternative.

There are two typedefs – command\_line\_parser and wcommand\_line\_parser, for charT == char and charT == wchar\_t cases.

## Public Functions

```
basic_command_line_parser (const std::vector<std::basic_string<Char>> &args)
```

Creates a command line parser for the specified arguments list. The ‘args’ parameter should not include program name.

```
basic_command_line_parser (int argc, const Char *const argv[])
```

Creates a command line parser for the specified arguments list. The parameters should be the same as passed to ‘main’.

```
basic_command_line_parser &options (const options_description &desc)
 Sets options descriptions to use.

basic_command_line_parser &positional (const positional_options_description &desc)
 Sets positional options description to use.

basic_command_line_parser &style (int)
 Sets the command line style.

basic_command_line_parser &extra_parser (ext_parser)
 Sets the extra parsers.

basic_parsed_options<Char> run ()
 Parses the options and returns the result of parsing. Throws on error.

basic_command_line_parser &allow_unregistered()
 Specifies that unregistered options are allowed and should be passed though. For each command
 like token that looks like an option but does not contain a recognized name, an instance of ba-
 sic_option<charT> will be added to result, with ‘unrecognized’ field set to ‘true’. It’s possible to
 collect all unrecognized options with the ‘collect_unrecognized’ function.

basic_command_line_parser &extra_style_parser (style_parser s)
```

## Private Members

```
const options_description *m_desc
```

```
template<class Char>
class basic_parsed_options
 #include <parsers.hpp> Results of parsing an input source. The primary use of this class is passing
 information from parsers component to value storage component. This class does not makes much
 sense itself.
```

## Public Functions

```
basic_parsed_options (const options_description *xdescription, int options_prefix =
 0)
```

## Public Members

```
std::vector<basic_option<Char>> options
 Options found in the source.
```

```
const options_description *description
 Options description that was used for parsing. Parsers should return pointer to the instance of
 option_description passed to them, and issues of lifetime are up to the caller. Can be NULL.
```

```
int m_options_prefix
 Mainly used for the diagnostic messages in exceptions. The canonical option prefix for the parser
 which generated these results, depending on the settings for basic_command_line_parser::style()
 or cmdline::style(). In order of precedence of command_line_style enums: allow_long al-
 low_long_disguise allow_dash_for_short allow_slash_for_short
```

```
template<>
```

```
class basic_parsed_options<wchar_t>
#include <parsers.hpp> Specialization of basic_parsed_options which:
• provides convenient conversion from basic_parsed_options<char>
• stores the passed char-based options for later use.
```

## Public Functions

```
basic_parsed_options (const basic_parsed_options<char> &po)
Constructs wrapped options from options in UTF8 encoding.
```

## Public Members

```
std::vector<basic_option<wchar_t>> options
```

```
const options_description *description
```

```
basic_parsed_options<char> utf8_encoded_options
```

Stores UTF8 encoded options that were passed to constructor, to avoid reverse conversion in some cases.

```
int m_options_prefix
```

Mainly used for the diagnostic messages in exceptions. The canonical option prefix for the parser which generated these results, depending on the settings for *basic\_command\_line\_parser::style()* or *cmdline::style()*. In order of precedence of command\_line\_style enums: allow\_long allow\_long\_disguise allow\_dash\_for\_short allow\_slash\_for\_short

```
namespace hpx
```

```
namespace program_options
```

```
class positional_options_description
```

```
#include <positional_options.hpp> Describes positional options.
```

The class allows to guess option names for positional options, which are specified on the command line and are identified by the position. The class uses the information provided by the user to associate a name with every positional option, or tell that no name is known.

The primary assumption is that only the relative order of the positional options themselves matters, and that any interleaving ordinary options don't affect interpretation of positional options.

The user initializes the class by specifying that first N positional options should be given the name X1, following M options should be given the name X2 and so on.

## Public Functions

```
positional_options_description()
```

```
positional_options_description &add (const char *name, int max_count)
```

Species that up to 'max\_count' next positional options should be given the 'name'. The value of '-1' means 'unlimited'. No calls to 'add' can be made after call with 'max\_value' equal to '-1'.

```
unsigned max_total_count () const
```

Returns the maximum number of positional options that can be present. Can return (*numeric\_limits<unsigned>::max*()) to indicate unlimited number.

```
const std::string &name_for_position(unsigned position) const
 Returns the name that should be associated with positional options at ‘position’. Precondition:
 position < max_total_count()
```

## Private Members

```
std::vector<std::string> m_names
std::string m_trailing
```

```
namespace hpx
```

```
namespace program_options
```

## Functions

```
template<class T>
typed_value<T> *value()
```

Creates a typed\_value<T> instance. This function is the primary method to create *value\_semantic* instance for a specific type, which can later be passed to ‘option\_description’ constructor. The second overload is used when it’s additionally desired to store the value of option into program variable.

```
template<class T>
typed_value<T> *value(T *v)
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

```
template<class T>
typed_value<T, wchar_t> *wvalue()
```

Creates a typed\_value<T> instance. This function is the primary method to create *value\_semantic* instance for a specific type, which can later be passed to ‘option\_description’ constructor.

```
template<class T>
typed_value<T, wchar_t> *wvalue(T *v)
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

```
typed_value<bool> *bool_switch()
```

Works the same way as the ‘value<bool>’ function, but the created *value\_semantic* won’t accept any explicit value. So, if the option is present on the command line, the value will be ‘true’.

```
typed_value<bool> *bool_switch(bool *v)
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

```
template<class T, class Char = char>
```

```
class typed_value : public hpx::program_options::value_semantic_codecvt_helper<char>, public hpx::program_options::value_semantic<Char>
```

#include <value\_semantic.hpp> Class which handles value of a specific type.

## Public Functions

**typed\_value** (*T \*store\_to*)

Ctor. The ‘store\_to’ parameter tells where to store the value when it’s known. The parameter can be NULL.

**typed\_value \*default\_value** (*const T &v*)

Specifies default value, which will be used if none is explicitly specified. The type ‘T’ should provide operator<< for ostream.

**typed\_value \*default\_value** (*const T &v, const std::string &textual*)

Specifies default value, which will be used if none is explicitly specified. Unlike the above overload, the type ‘T’ need not provide operator<< for ostream, but textual representation of default value must be provided by the user.

**typed\_value \*implicit\_value** (*const T &v*)

Specifies an implicit value, which will be used if the option is given, but without an adjacent value. Using this implies that an explicit value is optional,

**typed\_value \*value\_name** (*const std::string &name*)

Specifies the name used to to the value in help message.

**typed\_value \*implicit\_value** (*const T &v, const std::string &textual*)

Specifies an implicit value, which will be used if the option is given, but without an adjacent value. Using this implies that an explicit value is optional, but if given, must be strictly adjacent to the option, i.e.: ‘-ovalue’ or ‘option=value’. Giving ‘-o’ or ‘option’ will cause the implicit value to be applied. Unlike the above overload, the type ‘T’ need not provide operator<< for ostream, but textual representation of default value must be provided by the user.

**typed\_value \*notifier** (*std::function<void>*) **const T&**

>/Specifies a function to be called when the final value is determined.

**typed\_value \*composing** ()

Specifies that the value is composing. See the ‘is\_composing’ method for explanation.

**typed\_value \*multitoken** ()

Specifies that the value can span multiple tokens.

**typed\_value \*zero\_tokens** ()

Specifies that no tokens may be provided as the value of this option, which means that only presence of the option is significant. For such option to be useful, either the ‘validate’ function should be specialized, or the ‘implicit\_value’ method should be also used. In most cases, you can use the ‘bool\_switch’ function instead of using this method.

**typed\_value \*required** ()

Specifies that the value must occur.

*std::string name* () **const**

Returns the name of the option. The name is only meaningful for automatic help message.

**bool is\_composing** () **const**

Returns true if values from different sources should be composed. Otherwise, value from the first source is used and values from other sources are discarded.

**unsigned min\_tokens** () **const**

The minimum number of tokens for this option that should be present on the command line.

```
unsigned max_tokens() const
The maximum number of tokens for this option that should be present on the command line.

bool is_required() const
Returns true if value must be given. Non-optional value

void xparse(hpx::any_nonser &value_store, const std::vector<std::basic_string<Char>>
&new_tokens) const
Creates an instance of the ‘validator’ class and calls its operator() to perform the actual conversion.

virtual bool apply_default(hpx::any_nonser &value_store) const
If default value was specified via previous call to ‘default_value’, stores that value into ‘value_store’. Returns true if default value was stored.

void notify(const hpx::any_nonser &value_store) const
If an address of variable to store value was specified when creating *this, stores the value there. Otherwise, does nothing.

const std::type_info &value_type() const
```

class typed_value_base
#include <value_semantic.hpp> Base class for all option that have a fixed type, and are willing to announce this type to the outside world. Any ‘value_semantics’ for which you want to find out the type can be dynamic_cast-ed to typed_value_base. If conversion succeeds, the ‘type’ method can be called.
```

Subclassed by *hpx::program\_options::typed\_value< T, Char >*

## Public Functions

```
virtual const std::type_info &value_type() const = 0
virtual ~typed_value_base()

class untyped_value : public hpx::program_options::value_semantic_codecvt_helper<char>
 #include <value_semantic.hpp> Class which specifies a simple handling of a value: the value will
 have string type and only one token is allowed.
```

## Public Functions

```
untyped_value(bool zero_tokens = false)
std::string name() const
 Returns the name of the option. The name is only meaningful for automatic help message.

unsigned min_tokens() const
 The minimum number of tokens for this option that should be present on the command line.

unsigned max_tokens() const
 The maximum number of tokens for this option that should be present on the command line.

bool is_composing() const
 Returns true if values from different sources should be composed. Otherwise, value from the first
 source is used and values from other sources are discarded.

bool is_required() const
 Returns true if value must be given. Non-optional value

void xparse(hpx::any_nonser &value_store, const std::vector<std::string> &new_tokens)
 const
 If ‘value_store’ is already initialized, or new_tokens has more than one elements, throws. Other-
 wise, assigns the first string from ‘new_tokens’ to ‘value_store’, without any modifications.

bool apply_default(hpx::any_nonser&) const
 Does nothing.

void notify(const hpx::any_nonser&) const
 Does nothing.
```

## Private Members

```
bool m_zero_tokens

class value_semantic
 #include <value_semantic.hpp> Class which specifies how the option’s value is to be parsed and
 converted into C++ types.

 Subclassed by hpx::program_options::value_semantic_codecvt_helper< char >,
 hpx::program_options::value_semantic_codecvt_helper< wchar_t >
```

## Public Functions

```
virtual std::string name () const = 0
 Returns the name of the option. The name is only meaningful for automatic help message.

virtual unsigned min_tokens () const = 0
 The minimum number of tokens for this option that should be present on the command line.

virtual unsigned max_tokens () const = 0
 The maximum number of tokens for this option that should be present on the command line.

virtual bool is_composing () const = 0
 Returns true if values from different sources should be composed. Otherwise, value from the first
 source is used and values from other sources are discarded.

virtual bool is_required () const = 0
 Returns true if value must be given. Non-optional value

virtual void parse (hpx::any_nonser &value_store, const std::vector<std::string>
&new_tokens, bool utf8) const = 0
 Parses a group of tokens that specify a value of option. Stores the result in ‘value_store’, using
 whatever representation is desired. May be called several times if value of the same option is
 specified more than once.

virtual bool apply_default (hpx::any_nonser &value_store) const = 0
 Called to assign default value to ‘value_store’. Returns true if default value is assigned, and false
 if no default value exists.

virtual void notify (const hpx::any_nonser &value_store) const = 0
 Called when final value of an option is determined.

virtual ~value_semantic()

template<class Char>
class value_semantic_codecvt_helper
#include <value_semantic.hpp> Helper class which perform necessary character conversions in the
‘parse’ method and forwards the data further.

template<>
class value_semantic_codecvt_helper<char> : public hpx::program_options::value_semantic
#include <value_semantic.hpp> Helper conversion class for values that accept ascii strings as in-
put. Overrides the ‘parse’ method and defines new ‘xpars’ method taking std::string. Depending
on whether input to parse is ascii or UTF8, will pass it to xpars unmodified, or with UTF8->ascii
conversion.

Subclassed by hpx::program_options::typed_value< T, Char >,

hpx::program_options::untyped_value
```

## Protected Functions

```
virtual void xparse(hpx::any_nons
 &value_store, const std::vector<std::string>
 &new_tokens) const = 0
```

## Private Functions

```
void parse(hpx::any_nons
 &value_store, const std::vector<std::string> &new_tokens,
 bool utf8) const
```

Parses a group of tokens that specify a value of option. Stores the result in ‘value\_store’, using whatever representation is desired. May be called several times if value of the same option is specified more than once.

```
template<>
class value_semantic_codecvt_helper<wchar_t> : public hpx::program_options::value_semantic
#include <value_semantic.hpp> Helper conversion class for values that accept ascii strings as input.
Overrides the ‘parse’ method and defines new ‘xpars’e’ method taking std::wstring. Depending on whether input to parse is ascii or UTF8, will recode input to Unicode, or pass it unmodified.
```

## Protected Functions

```
virtual void xparse(hpx::any_nons
 &value_store, const std::vector<std::wstring>
 &new_tokens) const = 0
```

## Private Functions

```
void parse(hpx::any_nons
 &value_store, const std::vector<std::string> &new_tokens,
 bool utf8) const
```

Parses a group of tokens that specify a value of option. Stores the result in ‘value\_store’, using whatever representation is desired. May be called several times if value of the same option is specified more than once.

```
namespace hpx
```

```
namespace program_options
```

## Functions

```
void store(const basic_parsed_options<char> &options, variables_map &m, bool utf8 = false)
```

Stores in ‘m’ all options that are defined in ‘options’. If ‘m’ already has a non-defaulted value of an option, that value is not changed, even if ‘options’ specify some value.

```
void store(const basic_parsed_options<wchar_t> &options, variables_map &m)
```

Stores in ‘m’ all options that are defined in ‘options’. If ‘m’ already has a non-defaulted value of an option, that value is not changed, even if ‘options’ specify some value. This is wide character variant.

```
void notify(variables_map &m)
```

Runs all ‘notify’ function for options in ‘m’.

```
class abstract_variables_map
#include <variables_map.hpp> Implements string->string mapping with convenient value casting facilities.
```

Subclassed by *hpx::program\_options::variables\_map*

## Public Functions

```
abstract_variables_map()
abstract_variables_map(const abstract_variables_map *next)
virtual ~abstract_variables_map()

const variable_value &operator[](const std::string &name) const
```

Obtains the value of variable ‘name’, from \*this and possibly from the chain of variable maps.

- if there’s no value in \*this.
  - if there’s next variable map, returns value from it
  - otherwise, returns empty value
- if there’s defaulted value
  - if there’s next variable map, which has a non-defaulted value, return that
  - otherwise, return value from \*this
- if there’s a non-defaulted value, returns it.

```
void next(abstract_variables_map *next)
```

Sets next variable map, which will be used to find variables not found in \*this.

## Private Functions

```
virtual const variable_value &get(const std::string &name) const = 0
>Returns value of variable ‘name’ stored in *this, or empty value otherwise.
```

## Private Members

```
const abstract_variables_map *m_next
```

```
class variable_value
#include <variables_map.hpp> Class holding value of option. Contains details about how the value is set and allows to conveniently obtain the value.
```

## Public Functions

```
variable_value()
variable_value(const hpx::any_nonser &xv, bool xdefaulted)

template<class T>
const T &as() const
>If stored value is of type T, returns that value. Otherwise, throws boost::bad_any_cast exception.

template<class T>
```

*T* &**as** ()

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

**bool empty () const**

Returns true if no value is stored.

**bool defaulted () const**

Returns true if the value was not explicitly given, but has default value.

*hpx::any\_nonser &value () const*

Returns the contained value.

*hpx::any\_nonser &value ()*

Returns the contained value.

## Private Members

*hpx::any\_nonser v*

**bool m\_defaulted**

*std::shared\_ptr<const value\_semantic> m\_value\_semantic*

## Friends

**friend hpx::program\_options::variables\_map**

**void store (const basic\_parsed\_options<char> &options, variables\_map &m, bool utf8)**

Stores in ‘m’ all options that are defined in ‘options’. If ‘m’ already has a non-defaulted value of an option, that value is not changed, even if ‘options’ specify some value.

**class variables\_map : public hpx::program\_options::abstract\_variables\_map, public std::map<std::string, variable\_value>** Concrete variables map which store variables in real map.  
#include <variables\_map.hpp>

This class is derived from *std::map<std::string, variable\_value>*, so you can use all map operators to examine its content.

## Public Functions

**variables\_map ()**

**variables\_map (const abstract\_variables\_map \*next)**

**const variable\_value &operator[] (const std::string &name) const**

**void clear ()**

**void notify ()**

## Private Functions

```
const variable_value &get (const std::string &name) const
Implementation of abstract_variables_map::get which does ‘find’ in *this.
```

## Private Members

`std::set<std::string> m_final`  
Names of option with ‘final’ values – which should not be changed by subsequence assignments.

`std::map<std::string, std::string> m_required`  
Names of required options, filled by parser which has access to *options\_description*. The map values are the “canonical” names for each corresponding option. This is useful in creating diagnostic messages when the option is absent.

## Friends

```
void store (const basic_parsed_options<char> &options, variables_map &xm, bool utf8)
Stores in ‘m’ all options that are defined in ‘options’. If ‘m’ already has a non-defaulted value of an option, that value is not changed, even if ‘options’ specify some value.
```

## Defines

### `HPX_PROGRAM_OPTIONS_VERSION`

The version of the source interface. The value will be incremented whenever a change is made which might cause compilation errors for existing code.

### `HPX_PROGRAM_OPTIONS_IMPLICIT_VALUE_NEXT_TOKEN`

## properties

The contents of this module can be included with the header `hpx/modules/properties.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/properties.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX* API.

### `namespace hpx`

#### `namespace experimental`

hpx::thread
```

## Enums

### enum partitioner\_mode

This enumeration describes the modes available when creating a resource partitioner.

*Values:*

```
mode_default = 0
Default mode.
```

```
mode_allow_oversubscription = 1
```

Allow processing units to be oversubscribed, i.e. multiple worker threads to share a single processing unit.

```
mode_allow_dynamic_pools = 2
```

Allow worker threads to be added and removed from thread pools.

### enum scheduling\_policy

This enumeration lists the available scheduling policies (or schedulers) when creating thread pools.

*Values:*

```
user_defined = -2
```

```
unspecified = -1
```

```
local = 0
```

```
local_priority_fifo = 1
```

```
local_priority_lifo = 2
```

```
static_ = 3
```

```
static_priority = 4
```

```
abp_priority_fifo = 5
```

```
abp_priority_lifo = 6
```

```
shared_priority = 7
```

## Functions

`detail::partitioner &get_partitioner()`

May be used anywhere in code and returns a reference to the single, global resource partitioner.

`bool is_partitioner_valid()`

Returns true if the resource partitioner has been initialized. Returns false otherwise.

## runtime\_configuration

The contents of this module can be included with the header `hpx/modules/runtime_configuration.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/runtime_configuration.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

`namespace hpx`

`namespace agas`

## Enums

`enum service_mode`

*Values:*

`service_mode_invalid = -1`

`service_mode_bootstrap = 0`

`service_mode_hosted = 1`

## Defines

`HPX_REGISTER_COMMANDLINE_REGISTRY(RegistryType, componentname)`

The macro `HPX_REGISTER_COMMANDLINE_REGISTRY` is used to register the given component factory with `Hpx.Plugin`. This macro has to be used for each of the components.

`HPX_REGISTER_COMMANDLINE_DYNAMIC(RegistryType, componentname)`

`HPX_REGISTER_COMMANDLINE_OPTIONS()`

The macro `HPX_REGISTER_COMMANDLINE_OPTIONS` is used to define the required `Hpx.Plugin` entry point for the command line option registry. This macro has to be used in not more than one compilation unit of a component module.

`HPX_REGISTER_COMMANDLINE_OPTIONS_DYNAMIC()`

`namespace hpx`

`namespace components`

`struct component_commandline_base`

`#include <component_commandline_base.hpp>` The `component_commandline_base` has to be used as a base class for all component command-line line handling registries.

## Public Functions

```
virtual ~component_commandline_base()

virtual hpx::program_options::options_description add_commandline_options() = 0
 Return any additional command line options valid for this component.
```

**Return** The module is expected to fill a options\_description object with any additional command line options this component will handle.

**Note** This function will be executed by the runtime system during system startup.

## Defines

### HPX\_REGISTER\_COMPONENT\_FACTORY (*componentname*)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the component factories.

### HPX\_REGISTER\_COMPONENT\_MODULE ()

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module.

### HPX\_REGISTER\_COMPONENT\_MODULE\_DYNAMIC ()

## Defines

### HPX\_REGISTER\_COMPONENT\_REGISTRY (*RegistryType, componentname*)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

### HPX\_REGISTER\_COMPONENT\_REGISTRY\_DYNAMIC (*RegistryType, componentname*)

### HPX\_REGISTER\_REGISTRY\_MODULE ()

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module.

### HPX\_REGISTER\_REGISTRY\_MODULE\_DYNAMIC ()

```
namespace hpx
```

```
namespace components
```

### struct component\_registry\_base

```
#include <component_registry_base.hpp> The component_registry_base has to be used as a base class for all component registries.
```

## Public Functions

```
virtual ~component_registry_base()

virtual bool get_component_info (std::vector<std::string> &fillini, std::string const &filepath, bool is_static = false) = 0
 Return the ini-information for all contained components.
```

**Return** Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

**Parameters**

- *fillini*: [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.

```
virtual void register_component_type () = 0
```

Return the unique identifier of the component type this factory is responsible for.

**Return** Returns the unique identifier of the component type this factory instance is responsible for. This function throws on any error.

**Parameters**

- *locality*: [in] The id of the locality this factory is responsible for.
- *agas\_client*: [in] The AGAS client to use for component id registration (if needed).

### Enums

#### **enum runtime\_mode**

A HPX runtime can be executed in two different modes: console mode and worker mode.

*Values:*

**invalid** = -1

**console** = 0

The runtime is the console locality.

**worker** = 1

The runtime is a worker locality.

```
connect = 2
 The runtime is a worker locality connecting late

local = 3
 The runtime is fully local.

default_ = 4
 The runtime mode will be determined based on the command line arguments

last
```

## Functions

```
char const *get_runtime_mode_name(runtime_mode state)
 Get the readable string representing the name of the given runtime_mode constant.

runtime_mode get_runtime_mode_from_name(std::string const &mode)
 Returns the internal representation (runtime_mode constant) from the readable string representing the
 name.

This represents the internal representation from the readable string representing the name.
```

## Parameters

- mode: this represents the runtime mode

## Defines

```

## **runtime\_local**

The contents of this module can be included with the header `hpx/modules/runtime_local.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/runtime_local.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

### Defines

**HPX\_REGISTER\_STARTUP\_SHUTDOWN\_REGISTRY** (*RegistryType, componentname*)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

**HPX\_REGISTER\_STARTUP\_SHUTDOWN\_REGISTRY\_DYNAMIC** (*RegistryType, componentname*)

**HPX\_REGISTER\_STARTUP\_SHUTDOWN\_FUNCTIONS** ()

This macro is used to define the required Hpx.Plugin entry point for the startup/shutdown registry. This macro has to be used in not more than one compilation unit of a component module.

**HPX\_REGISTER\_STARTUP\_SHUTDOWN\_FUNCTIONS\_DYNAMIC** ()

**namespace hpx**

**namespace components**

**struct component\_startup\_shutdown\_base**

#include <component\_startup\_shutdown\_base.hpp> The component\_startup\_shutdown\_base has to be used as a base class for all component startup/shutdown registries.

## Public Functions

```
virtual ~component_startup_shutdown_base()

virtual bool get_startup_function (startup_function_type &startup, bool
 &pre_startup) = 0
Return any startup function for this component.
```

**Return** Returns *true* if the parameter *startup* has been successfully initialized with the startup function.

### Parameters

- *startup*: [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.

```
virtual bool get_shutdown_function (shutdown_function_type &shutdown, bool
 &pre_shutdown) = 0
Return any shutdown function for this component.
```

**Return** Returns *true* if the parameter *shutdown* has been successfully initialized with the shutdown function.

### Parameters

- *shutdown*: [in, out] The module is expected to fill this function object with a reference to a shutdown function. This function will be executed by the runtime system during system shutdown.

**namespace hpx**

## Functions

```
std::string get_config_entry (std::string const &key, std::string const &dflt)
Retrieve the string value of a configuration entry given by key.
```

```
std::string get_config_entry (std::string const &key, std::size_t dflt)
Retrieve the integer value of a configuration entry given by key.
```

```
void set_config_entry (std::string const &key, std::string const &value)
Set the string value of a configuration entry given by key.
```

```
void set_config_entry (std::string const &key, std::size_t value)
Set the integer value of a configuration entry given by key.
```

```
void set_config_entry_callback (std::string const &key, util::function_nonser<void> std::string
 const&, std::string const&
 > const &callback)Set the string value of a configuration entry given by key.
```

**namespace hpx**

## Functions

`std::string diagnostic_information(exception_info const &xi)`

Extract the diagnostic information embedded in the given exception and return a string holding a formatted message.

The function `hpx::diagnostic_information` can be used to extract all diagnostic information stored in the given exception instance as a formatted string. This simplifies debug output as it composes the diagnostics into one, easy to use function call. This includes the name of the source file and line number, the sequence number of the OS-thread and the HPX-thread id, the locality id and the stack backtrace of the point where the original exception was thrown.

**Return** The formatted string holding all of the available diagnostic information stored in the given exception instance.

**See** `hpx::get_error_locality_id()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,  
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,  
`hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`,  
`hpx::get_error_config()`, `hpx::get_error_state()`

### Parameters

- `xi`: The parameter `e` will be inspected for all diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

### Exceptions

- `std::bad_alloc`: (if any of the required allocation operations fail)

`std::uint32_t get_error_locality_id(hpx::exception_info const &xi)`

Return the locality id where the exception was thrown.

The function `hpx::get_error_locality_id` can be used to extract the diagnostic information element representing the locality id as stored in the given exception instance.

**Return** The locality id of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return `hpx::naming::invalid_locality_id`.

**See** `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,  
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,  
`hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`,  
`hpx::get_error_config()`, `hpx::get_error_state()`

### Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

### Exceptions

- `nothing`:

`std::string get_error_host_name(hpx::exception_info const &xi)`

Return the hostname of the locality where the exception was thrown.

The function `hpx::get_error_host_name` can be used to extract the diagnostic information element representing the host name as stored in the given exception instance.

**Return** The hostname of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

**See** `hpx::diagnostic_information()`, `hpx::get_error_process_id()`, `hpx::get_error_function_name()`,  
`hpx::get_error_file_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`,  
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,  
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,  
`hpx::get_error_state()`

#### Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

#### Exceptions

- `std::bad_alloc`: (if one of the required allocations fails)

`std::int64_t get_error_process_id(hpx::exception_info const &xi)`

Return the (operating system) process id of the locality where the exception was thrown.

The function `hpx::get_error_process_id` can be used to extract the diagnostic information element representing the process id as stored in the given exception instance.

**Return** The process id of the OS-process which threw the exception. If the exception instance does not hold this information, the function will return 0.

**See** `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_function_name()`,  
`hpx::get_error_file_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`,  
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,  
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,  
`hpx::get_error_state()`

#### Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

#### Exceptions

- `nothing`:

`std::string get_error_env(hpx::exception_info const &xi)`

Return the environment of the OS-process at the point the exception was thrown.

The function `hpx::get_error_env` can be used to extract the diagnostic information element representing the environment of the OS-process collected at the point the exception was thrown.

**Return** The environment from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

**See** `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,

---

`hpx::get_error_os_thread(), hpx::get_error_thread_id(), hpx::get_error_thread_description(),  
hpx::get_error(), hpx::get_error_backtrace(), hpx::get_error_what(), hpx::get_error_config(),  
hpx::get_error_state()`

### Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

### Exceptions

- `std::bad_alloc`: (if one of the required allocations fails)

`std::string get_error_backtrace (hpx::exception_info const &xi)`

Return the stack backtrace from the point the exception was thrown.

The function `hpx::get_error_backtrace` can be used to extract the diagnostic information element representing the stack backtrace collected at the point the exception was thrown.

**Return** The stack back trace from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

**See** `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,  
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,  
`hpx::get_error()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,  
`hpx::get_error_state()`

### Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

### Exceptions

- `std::bad_alloc`: (if one of the required allocations fails)

`std::size_t get_error_os_thread (hpx::exception_info const &xi)`

Return the sequence number of the OS-thread used to execute HPX-threads from which the exception was thrown.

The function `hpx::get_error_os_thread` can be used to extract the diagnostic information element representing the sequence number of the OS-thread as stored in the given exception instance.

**Return** The sequence number of the OS-thread used to execute the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size(-1)`.

**See** `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,  
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,  
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,  
`hpx::get_error_state()`

### Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

### Exceptions

- nothing:

`std::size_t get_error_thread_id(hpx::exception_info const &xi)`

Return the unique thread id of the HPX-thread from which the exception was thrown.

The function `hpx::get_error_thread_id` can be used to extract the diagnostic information element representing the HPX-thread id as stored in the given exception instance.

**Return** The unique thread id of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size_t(0)`.

**See** `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,  
`hpx::get_error_os_thread()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,  
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,  
`hpx::get_error_state()`

### Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

### Exceptions

- nothing:

`std::string get_error_thread_description(hpx::exception_info const &xi)`

Return any additionally available thread description of the HPX-thread from which the exception was thrown.

The function `hpx::get_error_thread_description` can be used to extract the diagnostic information element representing the additional thread description as stored in the given exception instance.

**Return** Any additionally available thread description of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

**See** `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,  
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_backtrace()`,  
`hpx::get_error_env()`, `hpx::get_error()`, `hpx::get_error_state()`, `hpx::get_error_what()`,  
`hpx::get_error_config()`

### Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

### Exceptions

- `std::bad_alloc`: (if one of the required allocations fails)

---

`std::string get_error_config(hpx::exception_info const &xi)`

Return the HPX configuration information point from which the exception was thrown.

The function `hpx::get_error_config` can be used to extract the HPX configuration information element representing the full HPX configuration information as stored in the given exception instance.

**Return** Any additionally available HPX configuration information the point from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

**See** `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,  
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_backtrace()`,  
`hpx::get_error_env()`, `hpx::get_error()`, `hpx::get_error_state()`, `hpx::get_error_what()`,  
`hpx::get_error_thread_description()`

#### Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

#### Exceptions

- `std::bad_alloc`: (if one of the required allocations fails)

`std::string get_error_state(hpx::exception_info const &xi)`

Return the HPX runtime state information at which the exception was thrown.

The function `hpx::get_error_state` can be used to extract the HPX runtime state information element representing the state the runtime system is currently in as stored in the given exception instance.

**Return** The point runtime state at the point at which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

**See** `hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,  
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_backtrace()`,  
`hpx::get_error_env()`, `hpx::get_error()`, `hpx::get_error_what()`, `hpx::get_error_thread_description()`

#### Parameters

- `xi`: The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

#### Exceptions

- `std::bad_alloc`: (if one of the required allocations fails)

`namespace hpx`

`namespace util`

## Functions

```
void may_attach_debugger(std::string const &category)
 Attaches a debugger if category is equal to the configuration entry hpx.attach-debugger.
```

```
namespace hpx
```

## Functions

```
std::uint32_t get_locality_id(error_code &ec = throws)
 Return the number of the locality this function is being called from.

 This function returns the id of the current locality.
```

**Note** The returned value is zero based and its maximum value is smaller than the overall number of localities the current application is running on (as returned by `get_num_localities()`).

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
namespace hpx
```

## Functions

```
std::string get_locality_name()
 Return the name of the locality this function is called on.

 This function returns the name for the locality on which this function is called.
```

**Return** This function returns the name for the locality on which the function is called. The name is retrieved from the underlying networking layer and may be different for different parcelports.

**See** `future<std::string> get_locality_name(naming::id_type const& id)`

```
namespace hpx
```

## Functions

```
std::uint32_t get_initial_num_localities()
 Return the number of localities which were registered at startup for the running application.

 The function get_initial_num_localities returns the number of localities which were connected to the console at application startup.
```

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**See** `hpx::find_all_localities, hpx::get_num_localities`

`lcos::future<std::uint32_t> get_num_localities()`

Asynchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` asynchronously returns the number of localities currently connected to the console. The returned future represents the actual result.

**Note** This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

**See** `hpx::find_all_localities, hpx::get_num_localities`

`std::uint32_t get_num_localities(launch::sync_policy, error_code &ec = throws)`

Return the number of localities which are currently registered for the running application.

The function `get_num_localities` returns the number of localities currently connected to the console.

**Note** This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**See** `hpx::find_all_localities, hpx::get_num_localities`

### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`namespace hpx`

## Functions

`std::size_t get_os_thread_count()`

Return the number of OS-threads running in the runtime instance the current HPX-thread is associated with.

`std::size_t get_os_thread_count(threads::executor const &exec)`

Return the number of worker OS- threads used by the given executor to execute HPX threads.

This function returns the number of cores used to execute HPX threads for the given executor. If the function is called while no HPX runtime system is active, it will return zero. If the executor is not valid, this function will fall back to retrieving the number of OS threads used by HPX.

### Parameters

- `exec`: [in] The executor to be used.

`namespace hpx`

## Functions

`std::string get_thread_name()`

Return the name of the calling thread.

This function returns the name of the calling thread. This name uniquely identifies the thread in the context of HPX. If the function is called while no HPX runtime system is active, the result will be “<unknown>”.

`namespace hpx`

```

## Enums

### enum os\_thread\_type

Types of kernel threads registered with the runtime.

*Values:*

**unknown** = -1

**main\_thread** = 0

kernel thread represents main thread

**worker\_thread**

kernel thread is used to schedule HPX threads

**io\_thread**

kernel thread can be used for IO operations

**timer\_thread**

kernel is used by timer operations

**parcel\_thread**

kernel is used by networking operations

**custom\_thread**

kernel is registered by the application

## Functions

### std::string get\_os\_thread\_type\_name (os\_thread\_type type)

Return a human-readable name representing one of the kernel thread types.

### struct os\_thread\_data

#include <os\_thread\_type.hpp> Registration data for kernel threads that is maintained by the runtime internally

## Public Members

### std::string label\_

name used for thread registration

### std::thread::id id\_

thread id of corresponding kernel thread

### std::uint64\_t native\_handle\_

the threads native handle

### os\_thread\_type type\_

HPX thread type.

```
namespace hpx

 namespace util

 class pool_timer
```

### Public Functions

```

 Ts&&... vs)

namespace hpx
```

## Functions

```
void set_error_handlers()
```

**class runtime**

### Public Types

```
using notification_policy_type = threads::policies::callback_notifier
Generate a new notification policy instance for the given thread name prefix

using hpx_main_function_type = int()
The hpx_main_function_type is the default function type usable as the main HPX thread function.

using hpx_errorssink_function_type = void (std::uint32_t, std::string const&)
```

### Public Functions

```
virtual notification_policy_type get_notification_policy(char const *prefix, runtime_local::os_thread_type
 type)

state get_state() const

void set_state(state s)

runtime(hpx::util::runtime_configuration &rtcfg, bool initialize)
Construct a new HPX runtime instance.

virtual ~runtime()
The destructor makes sure all HPX runtime services are properly shut down before exiting.

void on_exit(util::function_nonser<void>
> const &f) Manage list of functions to call on exit.

void starting()
Manage runtime ‘stopped’ state.
```

```
void stopping()
```

Call all registered on\_exit functions.

```
bool stopped() const
```

This accessor returns whether the runtime instance has been stopped.

```
hpx::util::runtime_configuration &get_config()
```

access configuration information

```
hpx::util::runtime_configuration const &get_config() const
```

```
std::size_t get_instance_number() const
```

```
util::thread_mapper &get_thread_mapper()
```

Return a reference to the internal PAPI thread manager.

```
threads::topology const &get_topology() const
```

```
virtual int run(util::function_nonser<hpx_main_function_type> const &func)
```

Run the HPX runtime system, use the given function for the main *thread* and block waiting for all threads to finish.

**Note** The parameter *func* is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

**Return** This function will return the value as returned as the result of the invocation of the function object given by the parameter *func*.

#### Parameters

- *func*: [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx\_main\_function\_type*. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

```
virtual int run()
```

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

**Return** This function will always return 0 (zero).

```
virtual void rethrow_exception()
```

Rethrow any stored exception (to be called after *stop()*)

```
virtual int start(util::function_nonser<hpx_main_function_type> const &func, bool blocking = false)
```

Start the runtime system.

**Return** If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter *func*. Otherwise it will return zero.

#### Parameters

- *func*: [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx\_main\_function\_type*.
- *blocking*: [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function runtime::start will call runtime::wait internally.

**virtual** int **start** (bool *blocking* = false)  
Start the runtime system.

**Return** If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter *func*. Otherwise it will return zero.

**Parameters**

- *blocking*: [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function `runtime::start` will call `runtime::wait` internally .

**virtual** int **wait** ()  
Wait for the shutdown action to be executed.

**Return** This function will return the value as returned as the result of the invocation of the function object given by the parameter *func*.

**virtual** void **stop** (bool *blocking* = true)  
Initiate termination of the runtime system.

**Parameters**

- *blocking*: [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

**virtual** int **suspend** ()  
Suspend the runtime system.

**virtual** int **resume** ()  
Resume the runtime system.

**virtual** int **finalize** (double)

**virtual** bool **is\_networking\_enabled** ()  
Return true if networking is enabled.

**virtual** *hpx::threads::threadmanager* &**get\_thread\_manager** ()  
Allow access to the thread manager instance used by the HPX runtime.

**virtual** std::string **here** () **const**  
Returns a string of the locality endpoints (usable in debug output)

**virtual** bool **report\_error** (std::size\_t *num\_thread*, std::exception\_ptr **const** &*e*, bool *terminate\_all* = true)  
Report a non-recoverable error to the runtime system.

**Parameters**

- *num\_thread*: [in] The number of the operating system thread the error has been detected in.
- *e*: [in] This is an instance encapsulating an exception which lead to this function call.

**virtual** bool **report\_error** (std::exception\_ptr **const** &*e*, bool *terminate\_all* = true)  
Report a non-recoverable error to the runtime system.

**Note** This function will retrieve the number of the current shepherd thread and forward to the `report_error` function above.

**Parameters**

- `e`: [in] This is an instance encapsulating an exception which lead to this function call.

**virtual void add\_pre\_startup\_function (startup\_function\_type f)**

Add a function to be executed inside a HPX thread before `hpx_main` but guaranteed to be executed before any startup function registered with `add_startup_function`.

**Note** The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

**Parameters**

- `f`: The function ‘`f`’ will be called from inside a HPX thread before `hpx_main` is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

**virtual void add\_startup\_function (startup\_function\_type f)**

Add a function to be executed inside a HPX thread before `hpx_main`

**Parameters**

- `f`: The function ‘`f`’ will be called from inside a HPX thread before `hpx_main` is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

**virtual void add\_pre\_shutdown\_function (shutdown\_function\_type f)**

Add a function to be executed inside a HPX thread during `hpx::finalize`, but guaranteed before any of the shutdown functions is executed.

**Note** The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

**Parameters**

- `f`: The function ‘`f`’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

**virtual void add\_shutdown\_function (shutdown\_function\_type f)**

Add a function to be executed inside a HPX thread during `hpx::finalize`

**Parameters**

- `f`: The function ‘`f`’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

**virtual hpx::util::io\_service\_pool \*get\_thread\_pool (char const \*name)**

Access one of the internal thread pools (io\_service instances) HPX is using to perform specific tasks. The three possible values for the argument `name` are “main\_pool”, “io\_pool”, “parcel\_pool”, and “timer\_pool”. For any other argument value the function will return zero.

**virtual bool register\_thread (char const \*name, std::size\_t num = 0, bool service\_thread  
= true, error\_code &ec = throws)**

Register an external OS-thread with HPX.

This function should be called from any OS-thread which is external to HPX (not created by HPX), but which needs to access HPX functionality, such as setting a value on a promise or similar.

‘main’, ‘io’, ‘timer’, ‘parcel’, ‘worker’

**Note** The function will compose a thread name of the form ‘<name>-thread#<num>’ which is used to register the thread. It is the user’s responsibility to ensure that each (composed) thread name is unique. HPX internally uses the following names for the threads it creates, do not reuse those:

**Parameters**

- name: [in] The name to use for thread registration.
- num: [in] The sequence number to use for thread registration. The default for this parameter is zero.
- service\_thread: [in] The thread should be registered as a service thread. The default for this parameter is ‘true’. Any service threads will be pinned to cores not currently used by any of the HPX worker threads.

**Note** This function should be called for each thread exactly once. It will fail if it is called more than once.

**Return** This function will return whether the requested operation succeeded or not.

**virtual bool unregister\_thread()**

Unregister an external OS-thread with HPX.

This function will unregister any external OS-thread from HPX.

**Note** This function should be called for each thread exactly once. It will fail if it is called more than once. It will fail as well if the thread has not been registered before (see *register\_thread*).

**Return** This function will return whether the requested operation succeeded or not.

**virtual runtime\_local::os\_thread\_data get\_os\_thread\_data (std::string const &label)**

Access data for a given OS thread that was previously registered by *register\_thread*.

**virtual bool enumerate\_os\_threads (util::function\_nonser<bool> runtime\_local::os\_thread\_data const > const &f const**

Enumerate all OS threads that have registered with the runtime.

**notification\_policy\_type::on\_startstop\_type on\_start\_func () const**

**notification\_policy\_type::on\_startstop\_type on\_stop\_func () const**

**notification\_policy\_type::on\_error\_type on\_error\_func () const**

**notification\_policy\_type::on\_startstop\_type on\_start\_func (notification\_policy\_type::on\_startstop\_type&&)**

**notification\_policy\_type::on\_startstop\_type on\_stop\_func (notification\_policy\_type::on\_startstop\_type&&)**

**notification\_policy\_type::on\_error\_type on\_error\_func (notification\_policy\_type::on\_error\_type&&)**

**virtual std::uint32\_t get\_locality\_id (error\_code &ec) const**

**virtual std::size\_t get\_num\_worker\_threads () const**

**virtual std::uint32\_t get\_num\_localities (hpx::launch::sync\_policy, error\_code &ec) const**

**virtual std::uint32\_t get\_initial\_num\_localities () const**

**virtual lcos::future<std::uint32\_t> get\_num\_localities () const**

**virtual std::string get\_locality\_name () const**

**virtual std::uint32\_t assign\_cores (std::string const&, std::uint32\_t)**

**virtual std::uint32\_t assign\_cores ()**

## Functions

```
char const *get_stack_size_name (std::ptrdiff_t size)
 Returns the stack size name.

 Get the readable string representing the given stack size constant.
```

### Parameters

- `size`: this represents the stack size

```
std::ptrdiff_t get_default_stack_size ()
 Returns the default stack size.

 Get the default stack size in bytes.

std::ptrdiff_t get_stack_size (thread_stacksize)
 Returns the stack size corresponding to the given stack size enumeration.

 Get the stack size corresponding to the given stack size enumeration.
```

### Parameters

- `size`: this represents the stack size

```
namespace util
```

## Functions

```
bool retrieve_commandline_arguments (hpx::program_options::options_description
 const &app_options,
 hpx::program_options::variables_map &vm)

bool retrieve_commandline_arguments (std::string const &appname,
 hpx::program_options::variables_map &vm)
```

```
namespace hpx
```

## Functions

```
bool register_thread (runtime *rt, char const *name, error_code &ec = throws)
 Register the current kernel thread with HPX, this should be done once for each external OS-thread intended
 to invoke HPX functionality. Calling this function more than once will return false.
```

```
void unregister_thread (runtime *rt)
 Unregister the thread from HPX, this should be done once in the end before the external thread exists.
```

```
runtime_local::os_thread_data get_os_thread_data (std::string const &label)
 Access data for a given OS thread that was previously registered by register_thread. This function must
 be called from a thread that was previously registered with the runtime.
```

```
bool enumerate_os_threads (util::function_nonser<bool> os_thread_data const &
 > const &f)
 > Enumerate all OS threads that have registered with the runtime.
```

```
std::size_t get_runtime_instance_number ()
 Return the runtime instance number associated with the runtime instance the current thread is running in.
```

```
bool register_on_exit (util::function_nonsr<void>
> const&Register a function to be called during system shutdown.
```

```
bool is_starting ()
Test whether the runtime system is currently being started.
```

This function returns whether the runtime system is currently being started or not, e.g. whether the current state of the runtime system is *hpx::state\_startup*

**Note** This function needs to be executed on a HPX-thread. It will return false otherwise.

```
bool tolerate_node_faults ()
Test if HPX runs in fault-tolerant mode.
```

This function returns whether the runtime system is running in fault-tolerant mode

```
bool is_running ()
Test whether the runtime system is currently running.
```

This function returns whether the runtime system is currently running or not, e.g. whether the current state of the runtime system is *hpx::state\_running*

**Note** This function needs to be executed on a HPX-thread. It will return false otherwise.

```
bool is_stopped ()
Test whether the runtime system is currently stopped.
```

This function returns whether the runtime system is currently stopped or not, e.g. whether the current state of the runtime system is *hpx::state\_stopped*

**Note** This function needs to be executed on a HPX-thread. It will return false otherwise.

```
bool is_stopped_or_shutting_down ()
Test whether the runtime system is currently being shut down.
```

This function returns whether the runtime system is currently being shut down or not, e.g. whether the current state of the runtime system is *hpx::state\_stopped* or *hpx::state\_shutdown*

**Note** This function needs to be executed on a HPX-thread. It will return false otherwise.

```
std::size_t get_num_worker_threads ()
Return the number of worker OS- threads used to execute HPX threads.
```

This function returns the number of OS-threads used to execute HPX threads. If the function is called while no HPX runtime system is active, it will return zero.

```
std::uint64_t get_system_uptime ()
Return the system uptime measure on the thread executing this call.
```

This function returns the system uptime measured in nanoseconds for the thread executing this call. If the function is called while no HPX runtime system is active, it will return zero.

```
namespace hpx
```

```
namespace parallel
```

```
 namespace execution
```

### Enums

```
enum service_executor_type
```

Values:

```
io_thread_pool
```

Selects creating a service executor using the I/O pool of threads

```
parcel_thread_pool
```

Selects creating a service executor using the parcel pool of threads

```
timer_thread_pool
```

Selects creating a service executor using the timer pool of threads

```
main_thread
```

Selects creating a service executor using the main thread

```
struct io_pool_executor : public service_executor
```

### Public Functions

```
io_pool_executor()
```

```
struct main_pool_executor : public service_executor
```

### Public Functions

```
main_pool_executor()
```

```
struct parcel_pool_executor : public service_executor
```

### Public Functions

```
parcel_pool_executor(char const *name_suffix = "-tcp")
```

```
struct service_executor : public service_executor
```

### Public Functions

```
service_executor(service_executor_type t, char const *name_suffix = "")
```

```
struct timer_pool_executor : public service_executor
```

## Public Functions

```
timer_pool_executor()

namespace hpx
```

### Typedefs

**typedef util::unique\_function<void ()> shutdown\_function\_type**

The type of a function which is registered to be executed as a shutdown or pre-shutdown function.

### Functions

**void register\_pre\_shutdown\_function(shutdown\_function\_type f)**

Add a function to be executed by a HPX thread during `hpx::finalize()` but guaranteed before any shutdown function is executed (system-wide)

Any of the functions registered with `register_pre_shutdown_function` are guaranteed to be executed by an HPX thread during the execution of `hpx::finalize()` before any of the registered shutdown functions are executed (see: `hpx::register_shutdown_function()`).

**Note** If this function is called while the pre-shutdown functions are being executed, or after that point, it will raise a `invalid_status` exception.

**See** `hpx::register_shutdown_function()`

#### Parameters

- `f`: [in] The function to be registered to run by an HPX thread as a pre-shutdown function.

**void register\_shutdown\_function(shutdown\_function\_type f)**

Add a function to be executed by a HPX thread during `hpx::finalize()` but guaranteed after any pre-shutdown function is executed (system-wide)

Any of the functions registered with `register_shutdown_function` are guaranteed to be executed by an HPX thread during the execution of `hpx::finalize()` after any of the registered pre-shutdown functions are executed (see: `hpx::register_pre_shutdown_function()`).

**Note** If this function is called while the shutdown functions are being executed, or after that point, it will raise a `invalid_status` exception.

**See** `hpx::register_pre_shutdown_function()`

#### Parameters

- `f`: [in] The function to be registered to run by an HPX thread as a shutdown function.

```
namespace hpx
```

## TypeDefs

**typedef** *util::unique\_function\_nonser<void ()>* **startup\_function\_type**

The type of a function which is registered to be executed as a startup or pre-startup function.

## Functions

**void register\_pre\_startup\_function(*startup\_function\_type f*)**

Add a function to be executed by a HPX thread before `hpx_main` but guaranteed before any startup function is executed (system-wide).

Any of the functions registered with `register_pre_startup_function` are guaranteed to be executed by an HPX thread before any of the registered startup functions are executed (see `hpx::register_startup_function()`).

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

**Note** If this function is called while the pre-startup functions are being executed or after that point, it will raise a `invalid_status` exception.

### Parameters

- *f*: [in] The function to be registered to run by an HPX thread as a pre-startup function.

**See** `hpx::register_startup_function()`

**void register\_startup\_function(*startup\_function\_type f*)**

Add a function to be executed by a HPX thread before `hpx_main` but guaranteed after any pre-startup function is executed (system-wide).

Any of the functions registered with `register_startup_function` are guaranteed to be executed by an HPX thread after any of the registered pre-startup functions are executed (see: `hpx::register_pre_startup_function()`), but before `hpx_main` is being called.

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

**Note** If this function is called while the startup functions are being executed or after that point, it will raise a `invalid_status` exception.

### Parameters

- *f*: [in] The function to be registered to run by an HPX thread as a startup function.

**See** `hpx::register_pre_startup_function()`

**namespace hpx**

**namespace threads**

## Functions

```
bool threadmanager_is (state st)
bool threadmanager_is_at_least (state st)

namespace hpx
```

## Functions

*threads::policies::callback\_notifier::on\_startstop\_type* **get\_thread\_on\_start\_func()**

Retrieve the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *register\_thread\_on\_start\_func*).

**Return** The currently installed error handler function.

**Note** This function can be called before the HPX runtime is initialized.

*threads::policies::callback\_notifier::on\_startstop\_type* **get\_thread\_on\_stop\_func()**

Retrieve the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *register\_thread\_on\_stop\_func*).

**Return** The currently installed error handler function.

**Note** This function can be called before the HPX runtime is initialized.

*threads::policies::callback\_notifier::on\_error\_type* **get\_thread\_on\_error\_func()**

Retrieve the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *register\_thread\_on\_error\_func*).

**Return** The currently installed error handler function.

**Note** This function can be called before the HPX runtime is initialized.

*threads::policies::callback\_notifier::on\_startstop\_type* **register\_thread\_on\_start\_func** (*threads::policies::callback\_no*  
*&&f*)

Set the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *get\_thread\_on\_start\_func*).

**Return** The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

**Note** This function can be called before the HPX runtime is initialized.

## Parameters

- `f`: The function to install as the new start handler.

```
threads::policies::callback_notifier::on_startstop_type register_thread_on_stop_func(threads::policies::callback_notifier::on_startstop_type& &&f)
```

Set the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see `get_thread_on_stop_func`).

**Return** The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

**Note** This function can be called before the HPX runtime is initialized.

#### Parameters

- `f`: The function to install as the new stop handler.

```
threads::policies::callback_notifier::on_error_type register_thread_on_error_func(threads::policies::callback_notifier::on_error_type& &&f)
```

Set the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see `get_thread_on_error_func`).

**Return** The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

**Note** This function can be called before the HPX runtime is initialized.

#### Parameters

- `f`: The function to install as the new error handler.

```
namespace hpx
```

```
namespace util
```

```
class thread_mapper
```

## Functions

`std::size_t get_num_thread_pools()`

Return the number of thread pools currently managed by the *resource\_partitioner*

`std::size_t get_num_threads()`

Return the number of threads in all thread pools currently managed by the *resource\_partitioner*

`std::size_t get_num_threads(std::string const &pool_name)`

Return the number of threads in the given thread pool currently managed by the *resource\_partitioner*

`std::size_t get_num_threads(std::size_t pool_index)`

Return the number of threads in the given thread pool currently managed by the *resource\_partitioner*

`std::size_t get_pool_index(std::string const &pool_name)`

Return the internal index of the pool given its name.

`std::string const &get_pool_name(std::size_t pool_index)`

Return the name of the pool given its internal index.

`threads::thread_pool_base &get_thread_pool(std::string const &pool_name)`

Return the name of the pool given its name.

`threads::thread_pool_base &get_thread_pool(std::size_t pool_index)`

Return the thread pool given its internal index.

`bool pool_exists(std::string const &pool_name)`

Return true if the pool with the given name exists.

`bool pool_exists(std::size_t pool_index)`

Return true if the pool with the given index exists.

**namespace threads**

## Functions

`std::int64_t get_thread_count(thread_schedule_state state = thread_schedule_state::unknown)`

The function `get_thread_count` returns the number of currently known threads.

**Note** If `state == unknown` this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

### Parameters

- `state`: [in] This specifies the thread-state for which the number of threads should be retrieved.

`std::int64_t get_thread_count(thread_priority priority, thread_schedule_state state = thread_schedule_state::unknown)`

The function `get_thread_count` returns the number of currently known threads.

**Note** If `state == unknown` this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

### Parameters

- **priority**: [in] This specifies the thread-priority for which the number of threads should be retrieved.
- **state**: [in] This specifies the thread-state for which the number of threads should be retrieved.

`std::int64_t get_idle_core_count ()`

The function `get_idle_core_count` returns the number of currently idling threads (cores).

`mask_type get_idle_core_mask ()`

The function `get_idle_core_mask` returns a bit-mask representing the currently idling threads (cores).

`bool enumerate_threads (util::function_nonser<bool> thread_id_type`

`> const &f, thread_schedule_state state = thread_schedule_state::unknown)` The function `enumerate_threads` will invoke the given function `f` for each thread with a matching thread state.

### Parameters

- `f`: [in] The function which should be called for each matching thread. Returning ‘false’ from this function will stop the enumeration process.
- `state`: [in] This specifies the thread-state for which the threads should be enumerated.

`namespace hpx`

`namespace util`

`namespace debug`

### Functions

```
std::vector<hpx::threads::thread_id_type> get_task_ids (hpx::threads::thread_schedule_state
state
=
hpx::threads::thread_schedule_state::suspended)

std::vector<hpx::threads::thread_data*> get_task_data (hpx::threads::thread_schedule_state
state
=
hpx::threads::thread_schedule_state::suspended)

std::string suspended_task_backtraces ()
```

### schedulers

The contents of this module can be included with the header `hpx/modules/schedulers.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/schedulers.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

`namespace hpx`

`namespace threads`

`namespace policies`

## TypeDefs

```
using default_local_priority_queue_scheduler_terminated_queue = lockfree_fifo

template<typename Mutex = std::mutex, typename PendingQueuing = lockfree_fifo, typename StagedQueuing>
class local_priority_queue_scheduler : public scheduler_base
 #include <local_priority_queue_scheduler.hpp> The local_priority_queue_scheduler maintains
 exactly one queue of work items (threads) per OS thread, where this OS thread pulls its next work
 from. Additionally it maintains separate queues: several for high priority threads and one for low
 priority threads. High priority threads are executed by the first N OS threads before any other
 work is executed. Low priority threads are executed by the last OS thread whenever no other
 work is available.
```

## Public Types

```
typedef std::false_type has_periodic_maintenance
```

```
typedef thread_queue<Mutex, PendingQueuing, StagedQueuing, TerminatedQueuing> thread_queue_type
```

```
typedef init_parameter init_parameter_type
```

## Public Functions

```
local_priority_queue_scheduler(init_parameter_type const &init, bool deferred_initialization = true)
```

```
~local_priority_queue_scheduler()
```

```
void abort_all_suspended_threads()
```

```

```

```
bool cleanup_terminated(std::size_t num_thread, bool delete_all)
```

```
void create_thread(thread_init_data &data, thread_id_ref_type *id, error_code &ec)
```

```
bool get_next_thread(std::size_t num_thread, bool running,
 threads::thread_id_ref_type &thrd, bool enable_stealing)
```

Return the next thread to be executed, return false if none is available

```
void schedule_thread(threads::thread_id_ref_type thrd, threads::thread_schedule_hint
 schedulehint, bool allow_fallback = false, thread_priority priority
 = thread_priority::normal)
```

Schedule the passed thread.

```
void schedule_thread_last(threads::thread_id_ref_type thrd,
 threads::thread_schedule_hint schedulehint, bool
 allow_fallback = false, thread_priority priority
 = thread_priority::normal)
```

```
void destroy_thread(threads::thread_data *thrd)
```

Destroy the passed thread as it has been terminated.

```
std::int64_t get_queue_length(std::size_t num_thread = std::size_t(-1)) const
```

```

std::int64_t get_thread_count (thread_schedule_state state = thread_schedule_state::unknown, thread_priority priority = thread_priority::default_, std::size_t num_thread = std::size_t(-1), bool = false) const

template<typename Mutex = std::mutex, typename PendingQueuing = concurrentqueue_fifo, typename Terminal>
```

```
class shared_priority_queue_scheduler : public scheduler_base
#include <shared_priority_queue_scheduler.hpp> The shared_priority_queue_scheduler maintains a set of high, normal, and low priority queues. For each priority level there is a core/queue ratio which determines how many cores share a single queue. If the high priority core/queue ratio is 4 the first 4 cores will share a single high priority queue, the next 4 will share another one and so on. In addition, the shared_priority_queue_scheduler is NUMA-aware and takes NUMA scheduling hints into account when creating and scheduling work.
```

Warning: PendingQueuing lifo causes lockup on termination

## TypeDefs

```
using default_static_priority_queue_scheduler_terminated_queue = lockfree_fifo

template<typename Mutex = std::mutex, typename PendingQueuing = lockfree_fifo, typename StagedQueuing>
class static_priority_queue_scheduler : public hpx::threads::policies::local_priority_queue_scheduler
 #include <static_priority_queue_scheduler.hpp> The static_priority_queue_scheduler maintains
 exactly one queue of work items (threads) per OS thread, where this OS thread pulls its next work
 from. Additionally it maintains separate queues: several for high priority threads and one for low
 priority threads. High priority threads are executed by the first N OS threads before any other
 work is executed. Low priority threads are executed by the last OS thread whenever no other
 work is available. This scheduler does not do any work stealing.
```

## Public Types

```
template<>
using base_type = local_priority_queue_scheduler<Mutex, PendingQueuing, StagedQueuing, TerminatedQueue>

template<>
using init_parameter_type = typename base_type::init_parameter_type
```

## Public Functions

```

Return the next thread to be executed, return false if none is available

```
bool wait_or_add_new(std::size_t num_thread, bool running, std::int64_t
 &idle_loop_count, bool, std::size_t &added)
```

This is a function which gets called periodically by the thread manager to allow for maintenance tasks to be executed in the scheduler. Returns true if the OS thread calling this function has to be terminated (i.e. no more work has to be done).

## Public Static Functions

```
static std::string get_scheduler_name()
```

```
namespace hpx
```

## namespace threads

## namespace policies

```
template<typename Mutex, typename PendingQueuing, typename StagedQueuing, typename TerminatedQ>
class thread_queue
```

## Public Functions

```
bool cleanup_terminated_locked(bool delete_all = false)
```

This function makes sure all threads which are marked for deletion (state is terminated) are properly destroyed.

This returns ‘true’ if there are no more terminated threads waiting to be deleted.

bool **cleanup\_terminated**(bool *delete all* = false)

**thread\_queue** (*std::size\_t queue\_num = std::size\_t(-1), thread\_queue\_init\_parameters parameters = {}*)

## serialization

The contents of this module can be included with the header `hpx/modules/serialization.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/serialization.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```

## synchronization

The contents of this module can be included with the header `hpx/modules/synchronization.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/synchronization.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```
namespace hpx
```

```
namespace experimental
```

```
template<typename ReadWriteT, typename ReadT, typename Allocator>
class async_rw_mutex
```

```
#include <async_rw_mutex.hpp> Read-write mutex where access is granted to a value through senders.
```

The wrapped value is accessed through read and readwrite, both of which return senders which call `set_value` on a connected receiver when the wrapped value is safe to read or write. The senders send the value through a wrapper type which is implicitly convertible to a reference of the wrapped value. Read-only senders send wrappers that are convertible to const references.

A read-write sender gives exclusive access to the wrapped value, while a read-only sender gives shared (with other read-only senders) access to the value.

A void mutex acts as a mutex around some user-managed resource, i.e. the void mutex does not manage any value and the types sent by the senders are not convertible. The sent types are copyable and release access to the protected resource when released.

The order in which senders call set\_value is determined by the order in which the senders are retrieved from the mutex. Connecting and starting the senders is thread-safe.

Retrieving senders from the mutex is not thread-safe.

The mutex is movable and non-copyable.

```
void tag_invoke(hpx::execution::experimental::start_t, operation_state &os)

namespace hpx

namespace lcos

namespace local

class barrier
#include <barrier.hpp> A barrier can be used to synchronize a specific number of threads, blocking all of the entering threads until all of the threads have entered the barrier.
```

**Note** A *barrier* is not a LCO in the sense that it has no global id and it can't be triggered using the action (parcel) mechanism. It is just a low level synchronization primitive allowing to synchronize a given number of *threads*.

## Public Functions

**barrier** (*std::size\_t number\_of\_threads*)

**~barrier** ()

**void wait** ()

The function *wait* will block the number of entering *threads* (as given by the constructor parameter *number\_of\_threads*), releasing all waiting threads as soon as the last *thread* entered this function.

**void count\_up** ()

The function *count\_up* will increase the number of *threads* to be waited in *wait* function.

**void reset** (*std::size\_t number\_of\_threads*)

The function *reset* will reset the number of *threads* as given by the function parameter *number\_of\_threads*. the newer coming *threads* executing the function *wait* will be waiting until *total\_* is equal to *barrier\_flag*. The last *thread* exiting the *wait* function will notify the newer *threads* waiting and the newer *threads* will get the reset *number\_of\_threads\_*. The function *reset* can be executed while previous *threads* executing waiting after they have been waken up. Thus *total\_* can not be reset to *barrier\_flag* which will break the comparison condition under the function *wait*.

## Private Members

*mutex\_type* **mtx\_**

This mutex protects the queue.

*local::detail::condition\_variable* **cond\_**

*std::atomic<bool>* **event\_**

**namespace hpx**

**namespace lcos**

**namespace local**

**class cpp20\_latch**

#include <latch.hpp> Latches are a thread coordination mechanism that allow one or more threads to block until an operation is completed. An individual latch is a singleuse object; once the operation has been completed, the latch cannot be reused.

Subclassed by *hpx::lcos::local::latch*

## Public Functions

**HPX\_NON\_COPYABLE** (*cpp20\_latch*)

**cpp20\_latch** (*std::ptrdiff\_t count*)

Initialize the latch

Requires: *count*  $\geq 0$ . Synchronization: None Postconditions: *counter\_ == count*.

**~cpp20\_latch()**

Requires: No threads are blocked at the synchronization point.

**Note** May be called even if some threads have not yet returned from *wait()* or *count\_down\_and\_wait()*, provided that *counter\_* is 0.

**Note** The destructor might not return until all threads have exited *wait()* or *count\_down\_and\_wait()*.

**Note** It is the caller's responsibility to ensure that no other thread enters *wait()* after one thread has called the destructor. This may require additional coordination.

**void count\_down** (*std::ptrdiff\_t update*)

Decrements *counter\_* by *n*. Does not block.

Requires: *counter\_ >= n* and *n >= 0*.

Synchronization: Synchronizes with all calls that block on this latch and with all *try\_wait* calls on this latch that return true .

## Exceptions

- Nothing..:

**bool try\_wait() const**

Returns: With very low probability false. Otherwise *counter == 0*.

```
void wait() const
```

If counter\_ is 0, returns immediately. Otherwise, blocks the calling thread at the synchronization point until counter\_ reaches 0.

#### Exceptions

- Nothing..:

```
void arrive_and_wait (std::ptrdiff_t update = 1)
```

Effects: Equivalent to: count\_down(update); wait();

### Public Static Functions

```
static constexpr std::ptrdiff_t() hpx::lcos::local::cpp20_latch::max()
```

Returns: The maximum value of counter that the implementation supports.

### Protected Types

```
using mutex_type = lcos::local::spinlock
```

### Protected Attributes

```
util::cache_line_data<mutex_type> mtx_
```

```
util::cache_line_data<local::detail::condition_variable> cond_
```

```
std::atomic<std::ptrdiff_t> counter_
```

```
bool notified_
```

```
class latch : public hpx::lcos::local::cpp20_latch
```

*#include <latch.hpp>* A latch maintains an internal counter\_ that is initialized when the latch is created. Threads may block at a synchronization point waiting for counter\_ to be decremented to 0. When counter\_ reaches 0, all such blocked threads are released.

Calls to *countdown\_and\_wait()* , *count\_down()* , *wait()* , *is\_ready()*, *count\_up()* , and *reset()* behave as atomic operations.

**Note** A local::latch is not an LCO in the sense that it has no global id and it can't be triggered using the action (parcel) mechanism. Use lcos::latch instead if this is required. It is just a low level synchronization primitive allowing to synchronize a given number of *threads*.

### Public Functions

```
HPX_NON_COPYABLE (latch)
```

```
latch (std::ptrdiff_t count)
```

Initialize the latch

Requires: count  $\geq 0$ . Synchronization: None Postconditions: counter\_ == count.

```
~latch ()
```

Requires: No threads are blocked at the synchronization point.

**Note** May be called even if some threads have not yet returned from `wait()` or `count_down_and_wait()`, provided that `counter_` is 0.

**Note** The destructor might not return until all threads have exited `wait()` or `count_down_and_wait()`.

**Note** It is the caller's responsibility to ensure that no other thread enters `wait()` after one thread has called the destructor. This may require additional coordination.

`void count_down_and_wait ()`

Decrements `counter_` by 1. Blocks at the synchronization point until `counter_` reaches 0.

Requires: `counter_ > 0`.

Synchronization: Synchronizes with all calls that block on this latch and with all `is_ready` calls on this latch that return true.

#### Exceptions

- Nothing.:

`bool is_ready () const`

Returns: `counter_ == 0`. Does not block.

#### Exceptions

- Nothing.:

`void abort_all ()`

`void count_up (std::ptrdiff_t n)`

Increments `counter_` by `n`. Does not block.

Requires: `n >= 0`.

#### Exceptions

- Nothing.:

`void reset (std::ptrdiff_t n)`

Reset `counter_` to `n`. Does not block.

Requires: `n >= 0`.

#### Exceptions

- Nothing.:

`namespace hpx`

`namespace lcos`

`namespace local`

## TypeDefs

```
typedef sliding_semaphore_var sliding_semaphore
```

```
template<typename Mutex = hpx::lcos::local::spinlock>
class sliding_semaphore_var
```

#include <sliding\_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Sliding semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. The difference to a counting semaphore is that a sliding semaphore will not limit the number of threads which are allowed to proceed, but will make sure that the difference between the (arbitrary) number passed to set and wait does not exceed a given threshold.

## Public Functions

```
sliding_semaphore_var (std::int64_t max_difference, std::int64_t lower_limit = 0)
```

Construct a new sliding semaphore.

### Parameters

- **max\_difference**: [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower\_limit**: [in] The initial lower limit.

```
void set_max_difference (std::int64_t max_difference, std::int64_t lower_limit = 0)
```

Set/Change the difference that will cause the semaphore to trigger.

### Parameters

- **max\_difference**: [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.

- `lower_limit`: [in] The initial lower limit.

```
void wait (std::int64_t upper_limit)
Wait for the semaphore to be signaled.
```

#### Parameters

- `upper_limit`: [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest `lower_limit` which was set by `signal()` is larger than the `max_difference`.

```
bool try_wait (std::int64_t upper_limit = 1)
Try to wait for the semaphore to be signaled.
```

**Return** The function returns true if the calling thread would not block if it was calling `wait()`.

#### Parameters

- `upper_limit`: [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest `lower_limit` which was set by `signal()` is larger than the `max_difference`.

```
void signal (std::int64_t lower_limit)
Signal the semaphore.
```

#### Parameters

- `lower_limit`: [in] The new lower limit. This will update the current lower limit of this semaphore. It will also re-schedule all suspended threads for which their associated upper limit is not larger than the lower limit plus the `max_difference`.

```
std::int64_t signal_all ()
```

## tag\_invoke

The contents of this module can be included with the header `hpx/modules/tag_invoke.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/tag_invoke.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```
namespace hpx
```

```
namespace util
```

### Typedefs

```
template<typename F, typename ...Ts>
using invoke_result_t = typename invoke_result<F, Ts...>::type
```

```
namespace hpx
```

```
namespace functional
```

### Typedefs

```
template<typename Tag, typename ...Args>
using tag_invoke_result = invoke_result<decaytype(tag_invoke), Tag, Args...>
 hpx::functional::tag_invoke_result<Tag, Args...> is the trait returning the result type of the call hpx::functional::tag_invoke. This can be used in a SFINAE context.
```

```
template<typename Tag, typename ...Args>
using tag_invoke_result_t = typename tag_invoke_result<Tag, Args...>::type
 hpx::functional::tag_invoke_result_t<Tag, Args...> evaluates to
 hpx::functional::tag_invoke_result_t<Tag, Args...>::type
```

## Variables

```
constexpr unspecified tag_invoke = unspecified
```

The `hpx::functional::tag_invoke` name defines a `constexpr` object that is invocable with one or more arguments. The first argument is a ‘tag’ (typically a DPO). It is only invocable if an overload of `tag_invoke()` that accepts the same arguments could be found via ADL.

The evaluation of the expression `hpx::tag_invoke(tag, args...)` is equivalent to evaluating the unqualified call to `tag_invoke(decay-copy(tag), std::forward<Args>(args)...)`.

`hpx::functional::tag_invoke` is implemented against P1895.

Example: Defining a new customization point `foo`:

```
namespace mylib {
 inline constexpr
 struct foo_fn final : hpx::functional::tag<foo_fn>
 {
 } foo{};
 }
```

Defining an object bar which customizes foo:

```
struct bar
{
 int x = 42;

 friend constexpr int tag_invoke(mylib::foo_fn, bar const& x)
 {
 return b.x;
 }
};
```

Using the customization point:

```
static_assert(42 == mylib::foo(bar{}), "The answer is 42");
```

```
template<typename Tag, typename ...Args>
constexpr bool is_tag_invocable_v = is_tag_invocable<Tag, Args...>::value
 hpx::functional::is_tag_invocable_v<Tag, Args...> evaluates to
 hpx::functional::is_tag_invocable<Tag, Args...>::value

template<typename Tag, typename ...Args>
constexpr bool is_nothrow_tag_invocable_v = is_nothrow_tag_invocable<Tag, Args...>::value
 hpx::functional::is_tag_invocable_v<Tag, Args...> evaluates to
 hpx::functional::is_tag_invocable<Tag, Args...>::value

template<typename Tag, typename ...Args>
struct is_nothrow_tag_invocable
 #include <tag_invoke.hpp> hpx::functional::is_nothrow_tag_invocable<Tag,
 Args...> is std::true_type if an overload of tag_invoke(tag, args...) can be found via
 ADL and is noexcept.

template<typename Tag, typename ...Args>
struct is_tag_invocable
 #include <tag_invoke.hpp> hpx::functional::is_tag_invocable<Tag, Args...> is
 std::true_type if an overload of tag_invoke(tag, args...) can be found via ADL.

template<typename Tag>
struct tag
 #include <tag_invoke.hpp> hpx::functional::tag<Tag> defines a base class that implements
 the necessary tag dispatching functionality for a given type Tag

template<typename Tag>
struct tag_noexcept
 #include <tag_invoke.hpp> hpx::functional::tag_noexcept<Tag> defines a base class
 that implements the necessary tag dispatching functionality for a given type Tag The implementation
 has to be noexcept

namespace hpx
```

## Variables

```
template<typename F, typename... Ts>HPX_INLINE_CONSTEXPR_VARIABLE bool hpx::is_invocable
template<typename R, typename F, typename... Ts>HPX_INLINE_CONSTEXPR_VARIABLE bool hpx
namespace traits
```

## TypeDefs

```
typedef hpx::is_invocable_r<R, F, Ts...> instead
```

## testing

The contents of this module can be included with the header `hpx/modules/testing.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/testing.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX API*.

## thread\_pool\_util

The contents of this module can be included with the header `hpx/modules/thread_pool_util.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/thread_pool_util.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

**namespace hpx**

**namespace threads**

## Functions

`hpx::future<void> resume_processing_unit (thread_pool_base &pool, std::size_t virt_core)`  
 Resumes the given processing unit. When the processing unit has been resumed the returned future will be ready.

**Note** Can only be called from an HPX thread. Use `resume_processing_unit_cb` or to resume the processing unit from outside HPX. Requires that the pool has `threads::policies::enable_elasticity` set.

**Return** A `future<void>` which is ready when the given processing unit has been resumed.

### Parameters

- `virt_core`: [in] The processing unit on the pool to be resumed. The processing units are indexed starting from 0.

`void resume_processing_unit_cb (thread_pool_base &pool,`  
`util::function_nonser<void> void`  
`> callback, std::size_t virt_core, error_code &ec = throws`Resumes the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been resumed.

**Note** Requires that the pool has `threads::policies::enable_elasticity` set.

### Parameters

- `callback`: [in] Callback which is called when the processing unit has been suspended.
- `virt_core`: [in] The processing unit to resume.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`hpx::future<void> suspend_processing_unit (thread_pool_base &pool, std::size_t`  
`virt_core)`  
 Suspends the given processing unit. When the processing unit has been suspended the returned future will be ready.

**Note** Can only be called from an HPX thread. Use suspend\_processing\_unit\_cb or to suspend the processing unit from outside HPX. Requires that the pool has threads::policies::enable\_elasticity set.

**Return** A future<void> which is ready when the given processing unit has been suspended.

**Parameters**

- `virt_core`: [in] The processing unit on the the pool to be suspended. The processing units are indexed starting from 0.

**Exceptions**

- `hpx::exception`: if called from outside the HPX runtime.

```
void suspend_processing_unit_cb(util::function_nonser<void> void
> callback, thread_pool_base &pool, std::size_t virt_core, error_code &ec = throwsSuspends the
given processing unit. Takes a callback as a parameter which will be called when the processing unit
has been suspended.
```

**Note** Requires that the pool has threads::policies::enable\_elasticity set.

**Parameters**

- `callback`: [in] Callback which is called when the processing unit has been suspended.
- `virt_core`: [in] The processing unit to suspend.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`hpx::future<void> resume_pool(thread_pool_base &pool)`

Resumes the thread pool. When the all OS threads on the thread pool have been resumed the returned future will be ready.

**Note** Can only be called from an HPX thread. Use resume\_cb or resume\_direct to suspend the pool from outside HPX.

**Return** A future<void> which is ready when the thread pool has been resumed.

**Exceptions**

- `hpx::exception`: if called from outside the HPX runtime.

```
void resume_pool_cb(thread_pool_base &pool, util::function_nonser<void> void
> callback, error_code &ec = throwsResumes the thread pool. Takes a callback as a parameter which
will be called when all OS threads on the thread pool have been resumed.
```

**Parameters**

- `callback`: [in] called when the thread pool has been resumed.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`hpx::future<void> suspend_pool(thread_pool_base &pool)`

Suspends the thread pool. When the all OS threads on the thread pool have been suspended the returned future will be ready.

**Note** Can only be called from an HPX thread. Use suspend\_cb or suspend\_direct to suspend the pool from outside HPX. A thread pool cannot be suspended from an HPX thread running on the pool itself.

**Return** A future<void> which is ready when the thread pool has been suspended.

**Exceptions**

- `hpx::exception`: if called from outside the HPX runtime.

---

```
void suspend_pool_cb(thread_pool_base &pool, util::function_nonservable<void> void
 > callback, error_code &ec = throws) Suspends the thread pool. Takes a callback as a parameter which
will be called when all OS threads on the thread pool have been suspended.
```

**Note** A thread pool cannot be suspended from an HPX thread running on the pool itself.

#### Parameters

- *callback*: [in] called when the thread pool has been suspended.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Exceptions

- *hpx::exception*: if called from an HPX thread which is running on the pool itself.

## thread\_pools

The contents of this module can be included with the header `hpx/modules/thread_pools.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/thread_pools.hpp`, not the particular header in which the functionality you would like to use is defined. ```

### threading\_base

The contents of this module can be included with the header `hpx/modules/threading_base.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/threading_base.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

## Functions

```
template<typename F>
constexpr F &&annotated_function(F &&f, char const* = nullptr)
```

Given a function as an argument, the user can *annotate\_function* as well. Annotating includes setting the thread description per thread id.

### Parameters

- function:

```
template<typename F>
constexpr F &&annotated_function(F &&f, std::string const&)
```

```
struct annotate_function
```

## Public Functions

```
HPX_NON_COPYABLE(annotate_function)

namespace hpx
```

```
namespace threads
```

## Functions

```
template<typename F>
thread_function_type make_thread_function(F &&f)

template<typename F>
thread_function_type make_thread_function_nullary(F &&f)

threads::thread_id_ref_type register_thread(threads::thread_init_data &data,
 threads::thread_pool_base *pool, error_code
 &ec = throws)
```

Create a new *thread* using the given data.

**Return** This function will return the internal id of the newly created HPX-thread.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

### Parameters

- *data*: [in] The data to use for creating the thread.
- *pool*: [in] The thread pool to use for launching the work.
- *ec*: [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

### Exceptions

- *invalid\_status*: if the runtime system has not been started yet.

```
threads::thread_id_ref_type register_thread(threads::thread_init_data &data, error_code
 &ec = throws)
```

Create a new *thread* using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

**Return** This function will return the internal id of the newly created HPX-thread.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

### Parameters

- *data*: [in] The data to use for creating the thread.
- *ec*: [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

### Exceptions

- *invalid\_status*: if the runtime system has not been started yet.

```
thread_id_ref_type register_work(threads::thread_init_data &data, threads::thread_pool_base
*pool, error_code &ec = throws)
```

Create a new work item using the given data.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *data*: [in] The data to use for creating the thread.
- *pool*: [in] The thread pool to use for launching the work.
- *ec*: [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Exceptions

- *invalid\_status*: if the runtime system has not been started yet.

```
thread_id_ref_type register_work(threads::thread_init_data &data, error_code &ec = throws)
```

Create a new work item using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *data*: [in] The data to use for creating the thread.
- *ec*: [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Exceptions

- *invalid\_status*: if the runtime system has not been started yet.

## Enums

### **enum scheduler\_mode**

This enumeration describes the possible modes of a scheduler.

*Values:*

#### **nothing\_special = 0x000**

As the name suggests, this option can be used to disable all other options.

#### **do\_background\_work = 0x001**

The scheduler will periodically call a provided callback function from a special HPX thread to enable performing background-work, for instance driving networking progress or garbage-collect AGAS.

#### **reduce\_thread\_priority = 0x002**

The kernel priority of the os-thread driving the scheduler will be reduced below normal.

#### **delay\_exit = 0x004**

The scheduler will wait for some unspecified amount of time before exiting the scheduling loop while being terminated to make sure no other work is being scheduled during processing the shutdown request.

#### **fast\_idle\_mode = 0x008**

Some schedulers have the capability to act as ‘embedded’ schedulers. In this case it needs to periodically invoke a provided callback into the outer scheduler more frequently than normal. This option enables this behavior.

#### **enable\_elasticity = 0x010**

This option allows for the scheduler to dynamically increase and reduce the number of processing units it runs on. Setting this value not succeed for schedulers that do not support this functionality.

#### **enable\_stealing = 0x020**

This option allows schedulers that support work thread/stealing to enable/disable it

#### **enable\_stealing\_numa = 0x040**

This option allows schedulersthat support it to disallow stealing between numa domains

#### **assign\_work\_round\_robin = 0x080**

This option tells schedulersthat support it to add tasks round robin to queues on each core

#### **assign\_work\_thread\_parent = 0x100**

This option tells schedulers that support it to add tasks round to the same core/queue that the parent task is running on

#### **steal\_high\_priority\_first = 0x200**

This option tells schedulers that support it to always (try to) steal high priority tasks from other queues before finishing their own lower priority tasks

#### **steal\_after\_local = 0x400**

This option tells schedulers that support it to steal tasks only when their local queues are empty

#### **enable\_idle\_backoff = 0x0800**

This option allows for certain schedulers to explicitly disable exponential idle-back off

---

**default\_mode** = *do\_background\_work* | *reduce\_thread\_priority* | *delay\_exit* | *enable\_stealing* | *enable\_stealing*  
 This option represents the default mode.

**all\_flags** = *do\_background\_work* | *reduce\_thread\_priority* | *delay\_exit* | *fast\_idle\_mode* | *enable\_elasticity* | *en*

This enables all available options.

## Functions

*thread\_data* \***get\_self\_id\_data**()

The function *get\_self\_id\_data* returns the data of the HPX thread id associated with the current thread (or nullptr if the current thread is not a HPX thread).

*thread\_data* \***get\_thread\_id\_data**(*thread\_id\_ref\_type const &tid*)

*thread\_data* \***get\_thread\_id\_data**(*thread\_id\_type const &tid*)

`thread_self &get_self()`

The function `get_self` returns a reference to the (OS thread specific) self reference to the current HPX thread.

`thread_self *get_self_ptr()`

The function `get_self_ptr` returns a pointer to the (OS thread specific) self reference to the current HPX thread.

`thread_self_impl_type *get_ctx_ptr()`

The function `get_ctx_ptr` returns a pointer to the internal data associated with each coroutine.

`thread_self *get_self_ptr_checked(error_code &ec = throws)`

The function `get_self_ptr_checked` returns a pointer to the (OS thread specific) self reference to the current HPX thread.

`thread_id_type get_self_id()`

The function `get_self_id` returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

`thread_id_type get_parent_id()`

The function `get_parent_id` returns the HPX thread id of the current thread's parent (or zero if the current thread is not a HPX thread).

**Note** This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

`std::size_t get_parent_phase()`

The function `get_parent_phase` returns the HPX phase of the current thread's parent (or zero if the current thread is not a HPX thread).

**Note** This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

`std::ptrdiff_t get_self_stacksize()`

The function `get_self_stacksize` returns the stack size of the current thread (or zero if the current thread is not a HPX thread).

`thread_stacksize get_self_stacksize_enum()`

The function `get_self_stacksize_enum` returns the stack size of the /.

`std::uint32_t get_parent_locality_id()`

The function `get_parent_locality_id` returns the id of the locality of the current thread's parent (or zero if the current thread is not a HPX thread).

**Note** This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

`std::uint64_t get_self_component_id()`

The function `get_self_component_id` returns the lva of the component the current thread is acting on

**Note** This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_TARGET_ADDRESS` being defined.

```
class thread_data : public thread_data_reference_counting
#include <thread_data.hpp>
```

A *thread* is the representation of a ParalleX thread. It's a first class object in ParalleX. In our implementation this is a user level thread running on top of one of the OS threads spawned by the *thread-manager*.

A *thread* encapsulates:

- A thread status word (see the functions *thread::get\_state* and *thread::set\_state*)
- A function to execute (the thread function)
- A frame (in this implementation this is a block of memory used as the threads stack)
- A block of registers (not implemented yet)

Generally, *threads* are not created or executed directly. All functionality related to the management of *threads* is implemented by the *thread-manager*.

Subclassed by *hpx::threads::thread\_data\_stackful*, *hpx::threads::thread\_data\_stackless*

## Public Types

```
using spinlock_pool = util::spinlock_pool<thread_data>
```

## Public Functions

```
thread_data(thread_data const&)

thread_data(thread_data&&)

thread_data &operator=(thread_data const&)

thread_data &operator=(thread_data&&)

thread_state get_state(std::memory_order order = std::memory_order_acquire) const
```

The *get\_state* function queries the state of this thread instance.

**Return** This function returns the current state of this thread. It will return one of the values as defined by the *thread\_state* enumeration.

**Note** This function will be seldom used directly. Most of the time the state of a thread will be retrieved by using the function *threadmanager::get\_state*.

```
thread_state set_state(thread_schedule_state state, thread_restart_state state_ex =
 thread_restart_state::unknown, std::memory_order load_order =
 std::memory_order_acquire, std::memory_order exchange_order =
 std::memory_order_seq_cst)
```

The *set\_state* function changes the state of this thread instance.

**Note** This function will be seldom used directly. Most of the time the state of a thread will have to be changed using the *threadmanager*. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status *threadmanager::set\_state* should be used.

### Parameters

- *newstate*: [in] The new state to be set for the thread.

```
bool set_state_tagged(thread_schedule_state newstate, thread_state &prev_state,
 thread_state &new_tagged_state, std::memory_order exchange_order =
 std::memory_order_seq_cst)
```

```
bool restore_state(thread_state new_state, thread_state old_state, std::memory_order
 load_order = std::memory_order_relaxed, std::memory_order
 load_exchange = std::memory_order_seq_cst)
```

The `restore_state` function changes the state of this thread instance depending on its current state. It will change the state atomically only if the current state is still the same as passed as the second parameter. Otherwise it won't touch the thread state of this instance.

**Note** This function will be seldom used directly. Most of the time the state of a thread will have to be changed using the `threadmanager`. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status `threadmanager::set_state` should be used.

**Return** This function returns `true` if the state has been changed successfully

**Parameters**

- `newstate`: [in] The new state to be set for the thread.
- `oldstate`: [in] The old state of the thread which still has to be the current state.

```
bool restore_state(thread_schedule_state new_state, thread_restart_state state_ex,
 thread_state old_state, std::memory_order load_exchange =
 std::memory_order_seq_cst)
```

**constexpr** `std::uint64_t get_component_id() const`

Return the id of the component this thread is running in.

`util::thread_description get_description() const`

`util::thread_description set_description(util::thread_description)`

`util::thread_description get_lco_description() const`

`util::thread_description set_lco_description(util::thread_description)`

**constexpr** `std::uint32_t get_parent_locality_id() const`

Return the locality of the parent thread.

**constexpr** `thread_id_type get_parent_thread_id() const`

Return the thread id of the parent thread.

**constexpr** `std::size_t get_parent_thread_phase() const`

Return the phase of the parent thread.

**constexpr** `util::backtrace const *get_backtrace() const`

`util::backtrace const *set_backtrace(util::backtrace const*)`

**constexpr** `thread_priority get_priority() const`

`void set_priority(thread_priority priority)`

`bool interruption_requested() const`

`bool interruption_enabled() const`

`bool set_interruption_enabled(bool enable)`

`void interrupt(bool flag = true)`

`bool interruption_point(bool throw_on_interrupt = true)`

```

bool add_thread_exit_callback(util::function_nonser<void>
 > const &f

void run_thread_exit_callbacks()

void free_thread_exit_callbacks()

bool is_stackless() const

void destroy_thread()

get_scheduler_base() const

std::size_t get_last_worker_thread_num() const

void set_last_worker_thread_num(std::size_t last_worker_thread_num)

std::ptrdiff_t get_stack_size() const

thread_stacksize get_stack_size_enum() const

template<typename ThreadQueue>
ThreadQueue &get_queue()

coroutine_type::result_type operator() (hpx::execution_base::this_thread::detail::agent_storage
 *agent_storage)
Execute the thread function.
```

**Return** This function returns the thread state the thread should be scheduled from this point on.  
The thread manager will use the returned value to set the thread's scheduling status.

```

virtual thread_id_type get_thread_id() const

virtual std::size_t get_thread_phase() const

virtual ~thread_data()

virtual void destroy() = 0
```

## Protected Functions

```
thread_restart_state set_state_ex(thread_restart_state new_state)
The set_state function changes the extended state of this thread instance.
```

**Note** This function will be seldom used directly. Most of the time the state of a thread will have to be changed using the threadmanager.

### Parameters

- newstate: [in] The new extended state to be set for the thread.

```
void rebind_base(thread_init_data &init_data)
```

```

```
class thread_data_stackful : public hpx::threads::thread_data
#include <thread_data_stackful.hpp> A thread is the representation of a ParalleX thread. It's a first class object in ParalleX. In our implementation this is a user level thread running on top of one of the OS threads spawned by the thread-manager.
```

A *thread* encapsulates:

- A thread status word (see the functions *thread::get\_state* and *thread::set\_state*)
- A function to execute (the thread function)
- A frame (in this implementation this is a block of memory used as the threads stack)
- A block of registers (not implemented yet)

Generally, *threads* are not created or executed directly. All functionality related to the management of *threads* is implemented by the thread-manager.

```

## Functions

```
util::thread_description get_thread_description(thread_id_type const &id, error_code
&ec = throws)
```

The function `get_thread_description` is part of the thread related API allows to query the description of one of the threads known to the thread-manager.

**Return** This function returns the description of the thread referenced by the `id` parameter. If the thread is not known to the thread-manager the return value will be the string “<unknown>”.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

### Parameters

- `id`: [in] The thread id of the thread being queried.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
util::thread_description set_thread_description(thread_id_type const &id,
util::thread_description const &desc
= util::thread_description(), error_code
&ec = throws)
```

```
util::thread_description get_thread_lco_description(thread_id_type const &id, error_code &ec = throws)
```

```
util::thread_description set_thread_lco_description(thread_id_type const &id,
util::thread_description const &desc = util::thread_description(),
error_code &ec = throws)
```

```
namespace util
```

## Functions

```
std::ostream &operator<<(std::ostream&, thread_description const&)
```

```
std::string as_string(thread_description const &desc)
```

```
struct thread_description
```

## Public Types

```
enum data_type
```

*Values:*

```
 data_type_description = 0
```

```
 data_type_address = 1
```

## Public Functions

```
thread_description()

constexpr thread_description(char const*)

template<typename F, typename = typename std::enable_if<!std::is_same<F, thread_description>::value && !traits>
constexpr thread_description(F const&, char const* = nullptr)

template<typename Action, typename = typename std::enable_if<traits::is_action<Action>::value>::type>
constexpr thread_description(Action, char const* = nullptr)

constexpr data_type kind() const

constexpr char const *get_description() const

constexpr std::size_t get_address() const

constexpr operator bool() const

constexpr bool valid() const
```

## Private Functions

```
void init_from_alternative_name(char const *altname)

namespace hpx

namespace this_thread
```

## Functions

```
threads::thread_restart_state suspend(threads::thread_schedule_state
 state, threads::thread_id_type id,
 util::thread_description const &description = util::thread_description("this_thread::suspend"),
 util::error_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

**Note** Must be called from within a HPX-thread.

### Exceptions

- If: `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::invalid_status`.

```
threads::thread_restart_state suspend(threads::thread_schedule_state state =
 threads::thread_schedule_state::pending,
 util::thread_description const &description =
 util::thread_description("this_thread::suspend"),
 error_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

**Note** Must be called from within a HPX-thread.

#### Exceptions

- If: `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::invalid_status`.

```
threads::thread_restart_state suspend(hpx::chrono::steady_time_point const
 &abs_time, threads::thread_id_type id,
 util::thread_description const &description =
 util::thread_description("this_thread::suspend"),
 error_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads at the given time.

**Note** Must be called from within a HPX-thread.

#### Exceptions

- If: `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::invalid_status`.

```
threads::thread_restart_state suspend(hpx::chrono::steady_time_point const &abs_time,
 util::thread_description const &description =
 util::thread_description("this_thread::suspend"),
 error_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads at the given time.

**Note** Must be called from within a HPX-thread.

#### Exceptions

- If: `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::invalid_status`.

```
threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,
 util::thread_description const &description =
 util::thread_description("this_thread::suspend"),
 error_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

**Note** Must be called from within a HPX-thread.

**Exceptions**

- If: `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::invalid_status`.

```
threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,
 threads::thread_id_type const &id,
 util::thread_description const &description = =
 util::thread_description("this_thread::suspend"), er-
 ror_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

**Note** Must be called from within a HPX-thread.

**Exceptions**

- If: `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::invalid_status`.

```
threads::thread_restart_state suspend(std::uint64_t ms, util::thread_description const &descrip-
 tion = util::thread_description("this_thread::suspend"), er-
 ror_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given time (specified in milliseconds).

**Note** Must be called from within a HPX-thread.

**Exceptions**

- If: `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::invalid_status`.

```
threads::thread_pool_base *get_pool(error_code &ec = throws)
```

Returns a pointer to the pool that was used to run the current thread

**Exceptions**

- If: `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of

*hpx::yield\_aborted* if it is signaled with *wait\_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::null\_thread\_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::invalid\_status*.

## namespace threads

### Functions

```
thread_state set_thread_state(thread_id_type const &id, thread_schedule_state state
= thread_schedule_state::pending, thread_restart_state stateex =
thread_restart_state::signaled, thread_priority priority =
thread_priority::normal, bool retry_on_active = true,

```

Set the thread state of the *thread* referenced by the thread\_id *id*.

**Note** If the thread referenced by the parameter *id* is in *thread\_state::active* state this function schedules a new thread which will set the state of the thread as soon as its not active anymore. The function returns *thread\_state::active* in this case.

**Return** This function returns the previous state of the thread referenced by the *id* parameter. It will return one of the values as defined by the *thread\_state* enumeration. If the thread is not known to the thread-manager the return value will be *thread\_state::unknown*.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *id*: [in] The thread id of the thread the state should be modified for.
- *state*: [in] The new state to be set for the thread referenced by the *id* parameter.
- *stateex*: [in] The new extended state to be set for the thread referenced by the *id* parameter.
- *priority*:
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
thread_id_ref_type set_thread_state(thread_id_type const &id,
hpx::chrono::steady_time_point const &abs_time,
std::atomic<bool> *started, thread_schedule_state state
= thread_schedule_state::pending, thread_restart_state
stateex = thread_restart_state::timeout, thread_priority
priority = thread_priority::normal, bool retry_on_active
= true, error_code &ec = throws)
```

Set the thread state of the *thread* referenced by the thread\_id *id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (at the given time)

#### Return

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *id*: [in] The thread id of the thread the state should be modified for.
- *abs\_time*: [in] Absolute point in time for the new thread to be run
- *started*: [in,out] A helper variable allowing to track the state of the timer helper thread
- *state*: [in] The new state to be set for the thread referenced by the *id* parameter.
- *stateex*: [in] The new extended state to be set for the thread referenced by the *id* parameter.
- *priority*:

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
thread_id_ref_type set_thread_state(thread_id_type const &id,
 hpx::chrono::steady_time_point const
 &abs_time, thread_schedule_state state =
 thread_schedule_state::pending, thread_restart_state
 stateex = thread_restart_state::timeout, thread_priority
 priority = thread_priority::normal, bool retry_on_active
 = true, error_code& = throws)
```

```
thread_id_ref_type set_thread_state(thread_id_type const &id,
 hpx::chrono::steady_duration const
 &rel_time, thread_schedule_state state =
 thread_schedule_state::pending, thread_restart_state
 stateex = thread_restart_state::timeout, thread_priority
 priority = thread_priority::normal, bool retry_on_active
 = true, error_code &ec = throws)
```

Set the thread state of the *thread* referenced by the *thread\_id id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (after the given duration)

### Return

**Note** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

### Parameters

- `id`: [in] The thread id of the thread the state should be modified for.
- `rel_time`: [in] Time duration after which the new thread should be run
- `state`: [in] The new state to be set for the thread referenced by the *id* parameter.
- `stateex`: [in] The new extended state to be set for the thread referenced by the *id* parameter.
- `priority`:
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
thread_state get_thread_state(thread_id_type const &id, error_code &ec = throws)
```

The function `get_thread_backtrace` is part of the thread related API allows to query the currently stored thread back trace (which is captured during thread suspension).

**Return** This function returns the currently captured stack back trace of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the zero.

**Note** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`. The function `get_thread_state` is part of the thread related API. It queries the state of one of the threads known to the thread-manager.

**Return** This function returns the thread state of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be *terminated*.

**Note** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

### Parameters

- `id`: [in] The thread id of the thread being queried.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

### Parameters

- `id`: [in] The thread id of the thread the state should be modified for.

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`std::size_t get_thread_phase(thread_id_type const &id, error_code &ec = throws)`

The function `get_thread_phase` is part of the thread related API. It queries the phase of one of the threads known to the thread-manager.

**Return** This function returns the thread phase of the thread referenced by the `id` parameter. If the thread is not known to the thread-manager the return value will be `~0`.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `id`: [in] The thread id of the thread the phase should be modified for.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`bool get_thread_interruption_enabled(thread_id_type const &id, error_code &ec = throws)`

Returns whether the given thread can be interrupted at this point.

**Return** This function returns `true` if the given thread can be interrupted at this point in time. It will return `false` otherwise.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `id`: [in] The thread id of the thread which should be queried.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`bool set_thread_interruption_enabled(thread_id_type const &id, bool enable, error_code &ec = throws)`

Set whether the given thread can be interrupted at this point.

**Return** This function returns the previous value of whether the given thread could have been interrupted.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `id`: [in] The thread id of the thread which should receive the new value.
- `enable`: [in] This value will determine the new interruption enabled status for the given thread.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`bool get_thread_interruption_requested(thread_id_type const &id, error_code &ec = throws)`

Returns whether the given thread has been flagged for interruption.

**Return** This function returns `true` if the given thread was flagged for interruption. It will return `false` otherwise.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `id`: [in] The thread id of the thread which should be queried.

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**void interrupt\_thread(thread\_id\_type const &id, bool flag, error\_code &ec = throws)**  
Flag the given thread for interruption.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

## Parameters

- `id`: [in] The thread id of the thread which should be interrupted.
  - `flag`: [in] The flag encodes whether the thread should be interrupted (if it is *true*), or ‘uninterrupted’ (if it is *false*).
  - `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
void interrupt_thread(thread_id_type const &id, error_code &ec = throws)
```

```
void interruption_point(thread_id_type const &id, error_code &ec = throws)
```

Interrupt the current thread at this point if it was canceled. This will throw a `thread_interrupted` exception, which will cancel the thread.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

## Parameters

- `id`: [in] The thread id of the thread which should be interrupted.
  - `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`threads::thread_priority get_thread_priority(thread_id_type const &id, error_code &ec = throws)`

Return priority of the given thread

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

## Parameters

- `id`: [in] The thread id of the thread whose priority is queried.
  - `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`std::ptrdiff_t get_stack_size(thread_id_type const &id, error_code &ec = throws)`

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

## Parameters

- `id`: [in] The thread id of the thread whose priority is queried.
  - `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`threads::thread_pool_base *get_pool(thread_id_type const &id, error_code &ec = throws)`  
Returns a pointer to the pool that was used to run the current thread.

### Exceptions

- If: `&ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::yield_aborted` if it is signaled with `wait_aborted`. If called outside of a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::invalid_status`.

```
namespace hpx

```

## Functions

`std::size_t get_worker_thread_num()`

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

**Note** The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by `get_os_thread_count()`).

**Note** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t get_worker_thread_num(error_code &ec)`

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

**Note** The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by `get_os_thread_count()`). It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

**Note** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

### Parameters

- `ec`: [in,out] this represents the error status on exit.

`std::size_t get_local_worker_thread_num()`

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

**Note** The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

**Note** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t get_local_worker_thread_num(error_code &ec)`

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

**Note** The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

**Note** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

### Parameters

- `ec`: [in,out] this represents the error status on exit.

`std::size_t get_thread_pool_num()`

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

**Note** The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

**Note** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t get_thread_pool_num(error_code &ec)`

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

**Note** The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

**Note** This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

### Parameters

- `ec`: [in,out] this represents the error status on exit.

`namespace hpx`

`namespace threads`

## Functions

`std::ostream &operator<< (std::ostream &os, thread_pool_base const &thread_pool)`

`struct executor_statistics`

`#include <thread_pool_base.hpp>` Data structure which stores statistics collected by an executor instance.

## Public Functions

`executor_statistics()`

## Public Members

```
std::uint64_t tasks_scheduled_
std::uint64_t tasks_completed_
std::uint64_t queue_length_
```

### class `thread_pool_base`

#include <thread\_pool\_base.hpp> The base class used to manage a pool of OS threads.

## Public Functions

```
virtual void suspend_processing_unit_direct(std::size_t virt_core, error_code
 &ec = throws) = 0
```

Suspends the given processing unit. Blocks until the processing unit has been suspended.

### Parameters

- `virt_core`: [in] The processing unit on the the pool to be suspended. The processing units are indexed starting from 0.

```
virtual void resume_processing_unit_direct(std::size_t virt_core, error_code
 &ec = throws) = 0
```

Resumes the given processing unit. Blocks until the processing unit has been resumed.

### Parameters

- `virt_core`: [in] The processing unit on the the pool to be resumed. The processing units are indexed starting from 0.

```
virtual void resume_direct(error_code &ec = throws) = 0
```

Resumes the thread pool. Blocks until all OS threads on the thread pool have been resumed.

### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
virtual void suspend_direct(error_code &ec = throws) = 0
```

Suspends the thread pool. Blocks until all OS threads on the thread pool have been suspended.

**Note** A thread pool cannot be suspended from an HPX thread running on the pool itself.

### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

### Exceptions

- `hpx::exception`: if called from an HPX thread which is running on the pool itself.

### struct `thread_pool_init_parameters`

## Public Functions

```
thread_pool_init_parameters(std::string const &name, std::size_t index,
policies::scheduler_mode mode, std::size_t num_threads, std::size_t thread_offset,

## threadmanager

The contents of this module can be included with the header `hpx/modules/threadmanager.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/threadmanager.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```
namespace hpx
```

```
namespace threads
```

```
class threadmanager
```

```
#include <threadmanager.hpp> The thread-manager class is the central instance of management for all (non-depleted) threads
```

### Public Types

```
typedef threads::policies::callback_notifier notification_policy_type
typedef std::unique_ptr<thread_pool_base> pool_type
typedef threads::policies::scheduler_base scheduler_type
typedef std::vector<pool_type> pool_vector
```

### Public Functions

```
threadmanager(hpx::util::runtime_configuration &rtefg_, notification_policy_type
¬ifier, detail::network_background_callback_type net-
work_background_callback = detail::network_background_callback())
```

```
~threadmanager()
```

```
void init()
```

```
void create_pools()
```

```
void print_pools(std::ostream&)
```

```
FIXME move to private and add hpx:printpools cmd line option.
```

```
thread_pool_base &default_pool() const
```

```
scheduler_type &default_scheduler() const
```

```
thread_pool_base &get_pool(std::string const &pool_name) const
```

```
thread_pool_base &get_pool(pool_id_type const &pool_id) const
```

```
thread_pool_base &get_pool(std::size_t thread_index) const
```

```
bool pool_exists(std::string const &pool_name) const
```

```
bool pool_exists (std::size_t pool_index) const
thread_id_ref_type register_work (thread_init_data &data, error_code &ec = throws)
The function register_work adds a new work item to the thread manager. It doesn't immediately
create a new thread, it just adds the task parameters (function, initial state and description) to the
internal management data structures. The thread itself will be created when the number of existing
threads drops below the number of threads specified by the constructors max_count parameter.
```

#### Parameters

- *func*: [in] The function or function object to execute as the thread's function. This must have a signature as defined by *thread\_function\_type*.
- *description*: [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.

```
void register_thread (thread_init_data &data, thread_id_ref_type &id, error_code &ec =
throws)
```

The function *register\_thread* adds a new work item to the thread manager. It creates a new *thread*, adds it to the internal management data structures, and schedules the new thread, if appropriate.

#### Parameters

- *func*: [in] The function or function object to execute as the thread's function. This must have a signature as defined by *thread\_function\_type*.
- *id*: [out] This parameter will hold the id of the created thread. This id is guaranteed to be validly initialized before the thread function is executed.
- *description*: [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.

```
bool run ()
```

Run the thread manager's work queue. This function instantiates the specified number of OS threads in each pool. All OS threads are started to execute the function *tfunc*.

**Return** The function returns *true* if the thread manager has been started successfully, otherwise it returns *false*.

```
void stop (bool blocking = true)
```

Forcefully stop the thread-manager.

#### Parameters

- *blocking*:

```
bool is_busy ()
```

```
bool is_idle ()
```

```
void wait ()
```

```
void suspend ()
```

```
void resume ()
```

```
state status () const
```

Return whether the thread manager is still running. This returns the "minimal state", i.e. the state of the least advanced thread pool.

---

```
std::int64_t get_thread_count (thread_schedule_state state = thread_schedule_state::unknown, thread_priority priority = thread_priority::default_, std::size_t num_thread = std::size_t(-1), bool reset = false)
 return the number of HPX-threads with the given state
```

**Note** This function lock the internal OS lock in the thread manager

```
std::int64_t get_idle_core_count ()

mask_type get_idle_core_mask ()

std::int64_t get_background_thread_count ()

bool enumerate_threads (util::function_nonser<bool> thread_id_type > const &f, thread_schedule_state state = thread_schedule_state::unknown) const

void abort_all_suspended_threads ()

bool cleanup_terminated (bool delete_all)

std::size_t get_os_thread_count () const
 Return the number of OS threads running in this thread-manager.

 This function will return correct results only if the thread-manager is running.

std::thread &get_os_thread_handle (std::size_t num_thread) const

void report_error (std::size_t num_thread, std::exception_ptr const &e)
 API functions forwarding to notification policy.

 This notifies the thread manager that the passed exception has been raised. The exception will be
 routed through the notifier and the scheduler (which will result in it being passed to the runtime
 object, which in turn will report it to the console, etc.).

mask_type get_used_processing_units () const
 Returns the mask identifying all processing units used by this thread manager.

hwloc_bitmap_ptr get_pool numa_bitmap (const std::string &pool_name) const

void set_scheduler_mode (threads::policies::scheduler_mode mode)

void add_scheduler_mode (threads::policies::scheduler_mode mode)

void add_remove_scheduler_mode (threads::policies::scheduler_mode
 to_add_mode, threads::policies::scheduler_mode
 to_remove_mode)

void remove_scheduler_mode (threads::policies::scheduler_mode mode)

void reset_thread_distribution ()

void init_tss (std::size_t global_thread_num)

void deinit_tss ()

std::int64_t get_queue_length (bool reset)

std::int64_t get_cumulative_duration (bool reset)
```

```
std::int64_t get_thread_count_unknown(bool reset)
std::int64_t get_thread_count_active(bool reset)
std::int64_t get_thread_count_pending(bool reset)
std::int64_t get_thread_count_suspended(bool reset)
std::int64_t get_thread_count_terminated(bool reset)
std::int64_t get_thread_count_staged(bool reset)
```

### Private Types

```
typedef std::mutex mutex_type
```

### Private Members

```

pool_vector pools_
notification_policy_type ¬ifier_
detail::network_background_callback_type network_background_callback_
```

## timed\_execution

The contents of this module can be included with the header `hpx/modules/timed_execution.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/timed_execution.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX* API.

```
namespace hpx
```

```
 namespace parallel
```

```
 namespace execution
```

### Variables

```
hpx::parallel::execution::post_at_t post_at
hpx::parallel::execution::post_after_t post_after
hpx::parallel::execution::async_execute_at_t async_execute_at
hpx::parallel::execution::async_execute_after_t async_execute_after
hpx::parallel::execution::sync_execute_at_t sync_execute_at
hpx::parallel::execution::sync_execute_after_t sync_execute_after
```

```
struct async_execute_after_t : public hpx::functional::detail::tag_fallback<async_execute_after_t>
#include <timed_execution_fwd.hpp> Customization point of asynchronous execution agent creation supporting timed execution.
```

This asynchronously creates a single function invocation *f()* using the associated executor at the given point in time.

**Return** *f(ts...)*'s result through a future

**Note** This calls *exec.async\_execute\_after(rel\_time, f, ts...)*, if available, otherwise it emulates timed scheduling by delaying calling *execution::async\_execute()* on the underlying non-time-scheduled execution agent.

#### Parameters

- *exec*: [in] The executor object to use for scheduling of the function *f*.
- *rel\_time*: [in] The duration of time after which the given function should be scheduled to run.
- *f*: [in] The function which will be scheduled using the given executor.
- *ts...: [in]* Additional arguments to use to invoke *f*.

### Private Functions

```
template<typename Executor, typename F, typename ...Ts>
decltype(auto) friend tag_fallback_invoke(async_execute_after_t, Executor
 &&exec, hpx::chrono::steady_duration
 const &rel_time, F &&f, Ts&&... ts)
```

```
struct async_execute_at_t : public hpx::functional::detail::tag_fallback<async_execute_at_t>
#include <timed_execution_fwd.hpp> Customization point of asynchronous execution agent creation supporting timed execution.
```

This asynchronously creates a single function invocation *f()* using the associated executor at the given point in time.

**Return** *f(ts...)*'s result through a future

**Note** This calls *exec.async\_execute\_at(abs\_time, f, ts...)*, if available, otherwise it emulates timed scheduling by delaying calling *execution::async\_execute()* on the underlying non-time-scheduled execution agent.

#### Parameters

- *exec*: [in] The executor object to use for scheduling of the function *f*.
- *abs\_time*: [in] The point in time the given function should be scheduled at to run.
- *f*: [in] The function which will be scheduled using the given executor.
- *ts...: [in]* Additional arguments to use to invoke *f*.

### Private Functions

```
template<typename Executor, typename F, typename ...Ts>
decltype(auto) friend tag_fallback_invoke(async_execute_at_t, Executor &&exec,
 hpx::chrono::steady_time_point
 const &abs_time, F &&f, Ts&&...
 ts)
```

```
struct post_after_t : public hpx::functional::detail::tag_fallback<post_after_t>
#include <timed_execution_fwd.hpp> Customization point of asynchronous fire & forget execution agent creation supporting timed execution.
```

This asynchronously (fire & forget) creates a single function invocation f() using the associated executor at the given point in time.

**Note** This calls exec.post\_after(rel\_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::post() on the underlying non-time-scheduled execution agent.

#### Parameters

- exec: [in] The executor object to use for scheduling of the function *f*.
- rel\_time: [in] The duration of time after which the given function should be scheduled to run.
- f: [in] The function which will be scheduled using the given executor.
- ts...: [in] Additional arguments to use to invoke *f*.

#### Private Functions

```
template<typename Executor, typename F, typename ...Ts>
decltype(auto) friend tag_fallback_invoke(post_after_t, Executor &&exec,
 hpx::chrono::steady_duration const
 &rel_time, F &&f, Ts&&... ts)

struct post_at_t : public hpx::functional::detail::tag_fallback<post_at_t>
#include <timed_execution_fwd.hpp> Customization point of asynchronous fire & forget execution agent creation supporting timed execution.
```

This asynchronously (fire & forget) creates a single function invocation f() using the associated executor at the given point in time.

**Note** This calls exec.post\_at(abs\_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::post() on the underlying non-time-scheduled execution agent.

#### Parameters

- exec: [in] The executor object to use for scheduling of the function *f*.
- abs\_time: [in] The point in time the given function should be scheduled at to run.
- f: [in] The function which will be scheduled using the given executor.
- ts...: [in] Additional arguments to use to invoke *f*.

#### Private Functions

```
template<typename Executor, typename F, typename ...Ts>
decltype(auto) friend tag_fallback_invoke(post_at_t, Executor &&exec,
 hpx::chrono::steady_time_point
 const &abs_time, F &&f, Ts&&...
 ts)

struct sync_execute_after_t : public hpx::functional::detail::tag_fallback<sync_execute_after_t>
#include <timed_execution_fwd.hpp> Customization point of synchronous execution agent creation supporting timed execution.
```

This synchronously creates a single function invocation f() using the associated executor at the given point in time.

**Return** f(ts...)’s result

**Note** This calls `exec.sync_execute_after(rel_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::sync_execute()` on the underlying non-time-scheduled execution agent.

#### Parameters

- `exec`: [in] The executor object to use for scheduling of the function *f*.
- `rel_time`: [in] The duration of time after which the given function should be scheduled to run.
- `f`: [in] The function which will be scheduled using the given executor.
- `ts...`: [in] Additional arguments to use to invoke *f*.

### Private Functions

```
template<typename Executor, typename F, typename ...Ts>
decltype(auto) friend tag_fallback_invoke(sync_execute_after_t, Executor
 &&exec, hpx::chrono::steady_duration
 const &rel_time, F &&f, Ts&&... ts)

struct sync_execute_at_t : public hpx::functional::detail::tag_fallback<sync_execute_at_t>
#include <timed_execution_fwd.hpp> Customization point of synchronous execution agent creation supporting timed execution.
```

This synchronously creates a single function invocation *f()* using the associated executor at the given point in time.

**Return** *f(ts...)*'s result

**Note** This calls `exec.sync_execute_at(abs_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::sync_execute()` on the underlying non-time-scheduled execution agent.

#### Parameters

- `exec`: [in] The executor object to use for scheduling of the function *f*.
- `abs_time`: [in] The point in time the given function should be scheduled at to run.
- `f`: [in] The function which will be scheduled using the given executor.
- `ts...`: [in] Additional arguments to use to invoke *f*.

### Private Functions

```
template<typename Executor, typename F, typename ...Ts>
decltype(auto) friend tag_fallback_invoke(sync_execute_at_t, Executor &&exec,

struct topology
```

## Public Functions

**topology()**

**~topology()**

```
std::size_t get_socket_number (std::size_t num_thread, error_code& = throws) const
Return the Socket number of the processing unit the given thread is running on.
```

### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
std::size_t get numa_node_number (std::size_t num_thread, error_code& = throws)
const
Return the NUMA node number of the processing unit the given thread is running on.
```

### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
mask_cref_type get_machine_affinity_mask (error_code &ec = throws) const
Return a bit mask where each set bit corresponds to a processing unit available to the application.
```

### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
mask_type get_service_affinity_mask (mask_cref_type used_processing_units, error_code &ec = throws) const
Return a bit mask where each set bit corresponds to a processing unit available to the service threads in the application.
```

### Parameters

- `used_processing_units`: [in] This is the mask of processing units which are not available for service threads.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
mask_cref_type get_socket_affinity_mask (std::size_t num_thread, error_code &ec = throws) const
Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the socket it is running on.
```

### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
mask_cref_type get numa_node_affinity_mask (std::size_t num_thread, error_code &ec = throws) const
Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the NUMA domain it is running on.
```

#### Parameters

- ec: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_type get numa_node_affinity_mask_from_numa_node (std::size_t num_node) const
Return a bit mask where each set bit corresponds to a processing unit associated with the given NUMA node.
```

#### Parameters

- ec: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_cref_type get core affinity mask (std::size_t num_thread, error_code &ec = throws) const
Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the core it is running on.
```

#### Parameters

- ec: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_cref_type get thread affinity mask (std::size_t num_thread, error_code &ec = throws) const
Return a bit mask where each set bit corresponds to a processing unit available to the given thread.
```

#### Parameters

- ec: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
void set thread affinity mask (mask_cref_type mask, error_code &ec = throws) const
```

Use the given bit mask to set the affinity of the given thread. Each set bit corresponds to a processing unit the thread will be allowed to run on.

**Note** Use this function on systems where the affinity must be set from inside the thread itself.

#### Parameters

- ec: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_type get thread affinity mask from lva (void const *lva, error_code &ec = throws) const
```

Return a bit mask where each set bit corresponds to a processing unit co-located with the memory the given address is currently allocated on.

#### Parameters

- ec: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
void print_affinity_mask (std::ostream &os, std::size_t num_thread, mask_cref_type m,
 const std::string &pool_name) const
Prints the.
```

#### Parameters

- m: to os in a human readable form

```
bool reduce_thread_priority (error_code &ec = throws) const
Reduce thread priority of the current thread.
```

#### Parameters

- ec: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
std::size_t get_number_of_sockets () const
Return the number of available NUMA domains.
```

```
std::size_t get_number_of numa_nodes () const
Return the number of available NUMA domains.
```

```
std::size_t get_number_of_cores () const
Return the number of available cores.
```

```
std::size_t get_number_of_pus () const
Return the number of available hardware processing units.
```

```
std::size_t get_number_of numa_node_cores (std::size_t numa) const
Return number of cores in given numa domain.
```

```
std::size_t get_number_of numa_node_pus (std::size_t numa) const
Return number of processing units in a given numa domain.
```

```
std::size_t get_number_of_socket_pus (std::size_t socket) const
Return number of processing units in a given socket.
```

```
std::size_t get_number_of_core_pus (std::size_t core) const
Return number of processing units in given core.
```

```
std::size_t get_number_of_socket_cores (std::size_t socket) const
Return number of cores units in given socket.
```

```
std::size_t get_core_number (std::size_t num_thread, error_code& = throws) const
```

```
std::size_t get_pu_number (std::size_t num_core, std::size_t num_pu, error_code &ec =
 throws) const
```

```
mask_type get_cpubind_mask (error_code &ec = throws) const
```

```
mask_type get_cpubind_mask (std::thread &handle, error_code &ec = throws) const
```

```
hwloc_bitmap_ptr cpuset_to_nodeset (mask_cref_type cpuset) const
convert a cpu mask into a numa node mask in hwloc bitmap form
```

```
void write_to_log () const
```

```
void *allocate (std::size_t len) const
```

This is equivalent to malloc(), except that it tries to allocate page-aligned memory from the OS.

```

void *allocate_membind(std::size_t len, hwloc_bitmap_ptr bitmap,
 hpx_hwloc_membind_policy policy, int flags) const
 allocate memory with binding to a numa node set as specified by the policy and flags (see hwloc
 docs)

threads::mask_type get_area_membind_nodeset(const void *addr, std::size_t len)
 const

bool set_area_membind_nodeset(const void *addr, std::size_t len, void *nodeset)
 const

int get numa_domain(const void *addr) const

void deallocate(void *addr, std::size_t len) const
 Free memory that was previously allocated by allocate.

## Functions

```
template<typename Iterator>
bool insert_checked (std::pair<Iterator, bool> const &r)
```

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

**Return** This function returns **r.second**.

**Parameters**

- **r**: [in] The return value of a std::map insert operation.

```
template<typename Iterator>
```

```
bool insert_checked (std::pair<Iterator, bool> const &r, Iterator &it)
```

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

**Return** This function returns **r.second**.

**Parameters**

- **r**: [in] The return value of a std::map insert operation.
- **r**: [out] A reference to an Iterator, which is set to **r.first**.

```
namespace hpx
```

namespace hpx
namespace util
```

## Functions

```
bool parse_sed_expression(std::string const &input, std::string &search, std::string &replace)
```

Parse a sed command.

**Return** *true* if the parsing was successful, false otherwise.

**Note** Currently, only supports search and replace syntax (s/search/replace/)

### Parameters

- **input:** [in] The content to parse.
- **search:** [out] If the parsing is successful, this string is set to the search expression.
- **search:** [out] If the parsing is successful, this string is set to the replace expression.

### struct sed\_transform

#include <sed\_transform.hpp> An unary function object which applies a sed command to its subject and returns the resulting string.

**Note** Currently, only supports search and replace syntax (s/search/replace/)

## Public Functions

```
sed_transform(std::string const &search, std::string const &replace)
```

```
sed_transform(std::string const &expression)
```

```
std::string operator()(std::string const &input) const

namespace actions
```

### Functions

```
template<typename Action>
threads::thread_priority action_priority()
```

## Defines

### HPX\_REGISTER\_ACTION\_DECLARATION(...)

Declare the necessary component action boilerplate code.

The macro `HPX_REGISTER_ACTION_DECLARATION` can be used to declare all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter `action` is the type of the action to declare the boilerplate for.

This macro can be invoked with an optional second parameter. This parameter specifies a unique name of the action to be used for serialization purposes. The second parameter has to be specified if the first parameter is not usable as a plain (non-qualified) C++ identifier, i.e. the first parameter contains special characters which cannot be part of a C++ identifier, such as '<', '>', or ':'.

```
namespace app
{
 // Define a simple component exposing one action 'print_greeting'
 class HPX_COMPONENT_EXPORT server
 : public hpx::components::component_base<server>
```

(continues on next page)

(continued from previous page)

```

{
 void print_greeting ()
 {
 hpx::cout << "Hey, how are you?\n" << hpx::flush;
 }

 // Component actions need to be declared, this also defines the
 // type 'print_greeting_action' representing the action.
 HPX_DEFINE_COMPONENT_ACTION(server,
 print_greeting, print_greeting_action);
};

// Declare boilerplate code required for each of the component actions.
HPX_REGISTER_ACTION_DECLARATION(app::server::print_greeting_action);

```

**Example:**

**Note** This macro has to be used once for each of the component actions defined using one of the `HPX_DEFINE_COMPONENT_ACTION` macros. It has to be visible in all translation units using the action, thus it is recommended to place it into the header file defining the component.

`HPX_REGISTER_ACTION_DECLARATION(...)`

`HPX_REGISTER_ACTION_DECLARATION_1(action)`

`HPX_REGISTER_ACTION(...)`

Define the necessary component action boilerplate code.

The macro `HPX_REGISTER_ACTION` can be used to define all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter `action` is the type of the action to define the boilerplate for.

This macro can be invoked with an optional second parameter. This parameter specifies a unique name of the action to be used for serialization purposes. The second parameter has to be specified if the first parameter is not usable as a plain (non-qualified) C++ identifier, i.e. the first parameter contains special characters which cannot be part of a C++ identifier, such as '<', '>', or ':'.

**Note** This macro has to be used once for each of the component actions defined using one of the `HPX_DEFINE_COMPONENT_ACTION` or `HPX_DEFINE_PLAIN_ACTION` macros. It has to occur exactly once for each of the actions, thus it is recommended to place it into the source file defining the component.

**Note** Only one of the forms of this macro `HPX_REGISTER_ACTION` or `HPX_REGISTER_ACTION_ID` should be used for a particular action, never both.

`HPX_REGISTER_ACTION_ID(action, actionname, actionid)`

Define the necessary component action boilerplate code and assign a predefined unique id to the action.

The macro `HPX_REGISTER_ACTION` can be used to define all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter `action` is the type of the action to define the boilerplate for.

The parameter *actionname* specifies an unique name of the action to be used for serialization purposes. The second parameter has to be usable as a plain (non-qualified) C++ identifier, it should not contain special characters which cannot be part of a C++ identifier, such as ‘<’, ‘>’, or ‘:’.

The parameter *actionid* specifies an unique integer value which will be used to represent the action during serialization.

**Note** This macro has to be used once for each of the component actions defined using one of the *HPX\_DEFINE\_COMPONENT\_ACTION* or global actions *HPX\_DEFINE\_PLAIN\_ACTION* macros. It has to occur exactly once for each of the actions, thus it is recommended to place it into the source file defining the component.

**Note** Only one of the forms of this macro *HPX\_REGISTER\_ACTION* or *HPX\_REGISTER\_ACTION\_ID* should be used for a particular action, never both.

```
namespace hpx
```

```
 namespace actions
```

```
 template<typename Component, typename Signature, typename Derived>
 struct basic_action
 #include <basic_action_fwd.hpp>
 Template Parameters
 • Component: component type
 • Signature: return type and arguments
 • Derived: derived action class
```

## Defines

**HPX\_DEFINE\_COMPONENT\_ACTION(...)**

Registers a member function of a component as an action type with HPX.

The macro *HPX\_DEFINE\_COMPONENT\_ACTION* can be used to register a member function of a component as an action type named *action\_type*.

The parameter *component* is the type of the component exposing the member function *func* which should be associated with the newly defined action type. The parameter *action\_type* is the name of the action type to register with HPX.

```
namespace app
{
 // Define a simple component exposing one action 'print_greeting'
 class HPX_COMPONENT_EXPORT server
 : public hpx::components::component_base<server>
 {
 void print_greeting() const
 {
 hpx::cout << "Hey, how are you?\n" << hpx::flush;
 }

 // Component actions need to be declared, this also defines the
 // type 'print_greeting_action' representing the action.
 }
}
```

(continues on next page)

(continued from previous page)

```
HPX_DEFINE_COMPONENT_ACTION(server, print_greeting,
 print_greeting_action);
};
```

**Example:**

The first argument must provide the type name of the component the action is defined for.

The second argument must provide the member function name the action should wrap.

The default value for the third argument (the typename of the defined action) is derived from the name of the function (as passed as the second argument) by appending ‘\_action’. The third argument can be omitted only if the second argument with an appended suffix ‘\_action’ resolves to a valid, unqualified C++ type name.

**Note** The macro *HPX\_DEFINE\_COMPONENT\_ACTION* can be used with 2 or 3 arguments. The third argument is optional.

**Defines****HPX\_DEFINE\_PLAIN\_ACTION(...)**

Defines a plain action type.

```
namespace app
{
 void some_global_function(double d)
 {
 cout << d;
 }

 // This will define the action type 'app::some_global_action' which
 // represents the function 'app::some_global_function'.
 HPX_DEFINE_PLAIN_ACTION(some_global_function, some_global_action);
}
```

**Example:**

**Note** Usually this macro will not be used in user code unless the intent is to avoid defining the action\_type in global namespace. Normally, the use of the macro *HPX\_PLAIN\_ACTION* is recommended.

**Note** The macro *HPX\_DEFINE\_PLAIN\_ACTION* can be used with 1 or 2 arguments. The second argument is optional. The default value for the second argument (the typename of the defined action) is derived from the name of the function (as passed as the first argument) by appending ‘\_action’. The second argument can be omitted only if the first argument with an appended suffix ‘\_action’ resolves to a valid, unqualified C++ type name.

**HPX\_DECLARE\_PLAIN\_ACTION(...)**

Declares a plain action type.

**HPX\_PLAIN\_ACTION(...)**

Defines a plain action type based on the given function *func* and registers it with HPX.

The macro *HPX\_PLAIN\_ACTION* can be used to define a plain action (e.g. an action encapsulating a global or free function) based on the given function *func*. It defines the action type *name* representing the given function. This macro additionally registers the newly defined action type with HPX.

The parameter *func* is a global or free (non-member) function which should be encapsulated into a plain action. The parameter *name* is the name of the action type defined by this macro.

```
namespace app
{
 void some_global_function(double d)
 {
 cout << d;
 }

// This will define the action type 'some_global_action' which represents
// the function 'app::some_global_function'.
HPX_PLAIN_ACTION(app::some_global_function, some_global_action);
```

**Example:**

**Note** The macro *HPX\_PLAIN\_ACTION* has to be used at global namespace even if the wrapped function is located in some other namespace. The newly defined action type is placed into the global namespace as well.

**Note** The macro *HPX\_PLAIN\_ACTION\_ID* can be used with 1, 2, or 3 arguments. The second and third arguments are optional. The default value for the second argument (the typename of the defined action) is derived from the name of the function (as passed as the first argument) by appending '\_action'. The second argument can be omitted only if the first argument with an appended suffix '\_action' resolves to a valid, unqualified C++ type name. The default value for the third argument is *hpx::components::factory\_check*.

**Note** Only one of the forms of this macro *HPX\_PLAIN\_ACTION* or *HPX\_PLAIN\_ACTION\_ID* should be used for a particular action, never both.

**HPX\_PLAIN\_ACTION\_ID(func, name, id)**

Defines a plain action type based on the given function *func* and registers it with HPX.

The macro *HPX\_PLAIN\_ACTION\_ID* can be used to define a plain action (e.g. an action encapsulating a global or free function) based on the given function *func*. It defines the action type *actionname* representing the given function. The parameter *actionid*

The parameter *actionid* specifies an unique integer value which will be used to represent the action during serialization.

The parameter *func* is a global or free (non-member) function which should be encapsulated into a plain action. The parameter *name* is the name of the action type defined by this macro.

The second parameter has to be usable as a plain (non-qualified) C++ identifier, it should not contain special characters which cannot be part of a C++ identifier, such as '<', '>', or ':'.

```

namespace app
{
 void some_global_function(double d)
 {
 cout << d;
 }
}

// This will define the action type 'some_global_action' which represents
// the function 'app::some_global_function'.
HPX_PLAIN_ACTION_ID(app::some_global_function, some_global_action,
 some_unique_id);

```

**Example:**

**Note** The macro *HPX\_PLAIN\_ACTION\_ID* has to be used at global namespace even if the wrapped function is located in some other namespace. The newly defined action type is placed into the global namespace as well.

**Note** Only one of the forms of this macro *HPX\_PLAIN\_ACTION* or *HPX\_PLAIN\_ACTION\_ID* should be used for a particular action, never both.

std::uint64_t get_cache_erase_entry_time (bool reset)
bool register_locality (parcelset::endpoints_type const &endpoints, naming::gid_type
&prefix, std::uint32_t num_threads, error_code &ec = throws)
 Add a locality to the runtime.
```

```
parcelset::endpoints_type const &resolve_locality (naming::gid_type const &gid,
error_code &ec = throws)
 Resolve a locality to its prefix.
```

**Return** Returns an empty vector if the locality is not registered.

```
bool has_resolved_locality (naming::gid_type const &gid)
```

```
bool unregister_locality (naming::gid_type const &gid, error_code &ec = throws)
 Remove a locality from the runtime.
```

```
void remove_resolved_locality (naming::gid_type const &gid)
 remove given locality from locality cache
```

```
bool get_console_locality (naming::gid_type &locality, error_code &ec = throws)
 Get locality locality_id of the console locality.
```

**Return** This function returns *true* if a console locality\_id exists and returns *false* otherwise.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *locality\_id*: [out] The locality\_id value uniquely identifying the console locality. This is valid only, if the return value of this function is true.
- *try\_cache*: [in] If this is set to true the console is first tried to be found in the local cache. Otherwise this function will always query AGAS, even if the console locality\_id is already known locally.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
bool get_localities (std::vector<naming::gid_type> &locality_ids, components::component_type type, error_code &ec = throws)
 Query for the locality_ids of all known localities.
```

This function returns the locality\_ids of all localities known to the AGAS server or all localities having a registered factory for a given component type.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *locality\_ids*: [out] The vector will contain the prefixes of all localities registered with the AGAS server. The returned vector holds the prefixes representing the runtime\_support components of these localities.
- *type*: [in] The component type will be used to determine the set of prefixes having a registered factory for this component. The default value for this parameter is *components::component\_invalid*, which will return prefixes of all localities.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
bool get_localities (std::vector<naming::gid_type> &locality_ids, error_code &ec = throws)
```

```
lcos::future<std::uint32_t> get_num_localities_async (components::component_type type = components::component_invalid) const
```

Query for the number of all known localities.

This function returns the number of localities known to the AGAS server or the number of localities having a registered factory for a given component type.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *type*: [in] The component type will be used to determine the set of prefixes having a registered factory for this component. The default value for this parameter is *components::component\_invalid*, which will return prefixes of all localities.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
std::uint32_t get_num_localities (components::component_type type, error_code &ec = throws) const
```

```
std::uint32_t get_num_localities (error_code &ec = throws) const
```

```
lcos::future<std::uint32_t> get_num_overall_threads_async () const
```

```
std::uint32_t get_num_overall_threads (error_code &ec = throws) const
```

```
lcos::future<std::vector<std::uint32_t>> get_num_threads_async () const
```

```
std::vector<std::uint32_t> get_num_threads (error_code &ec = throws) const
```

```
components::component_type get_component_id (std::string const &name, error_code &ec = throws)
```

Return a unique id usable as a component type.

This function returns the component type id associated with the given component name. If this is the first request for this component name a new unique id will be created.

**Return** The function returns the currently associated component type. Any error results in an exception thrown from this function.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *name*: [in] The component name (string) to get the component type for.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
void iterate_types (iterate_types_function_type const &f, error_code &ec = throws)
```

```
std::string get_component_type_name (components::component_type id, error_code &ec = throws)
```

```
components::component_type register_factory (naming::gid_type const &locality_id, std::string const &name, error_code &ec = throws)
```

Register a factory for a specific component type.

This function allows to register a component factory for a given locality and component type.

**Return** The function returns the currently associated component type. Any error results in an exception thrown from this function. The returned component type is the same as if the function `get_component_id` was called using the same component name.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `locality_id`: [in] The locality value uniquely identifying the given locality the factory needs to be registered for.
- `name`: [in] The component name (string) to register a factory for the given component type for.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
components::component_type register_factory (std::uint32_t locality_id, std::string
 const &name, error_code &ec =
 throws)
```

```
bool get_id_range (std::uint64_t count, naming::gid_type &lower_bound, naming::gid_type
 &upper_bound, error_code &ec = throws)
Get unique range of freely assignable global ids.
```

Every locality needs to be able to assign global ids to different components without having to consult the AGAS server for every id to generate. This function can be called to preallocate a range of ids usable for this purpose.

**Return** This function returns `true` if a new range has been generated (it has been called for the first time for the given locality) and returns `false` if this locality already got a range assigned in an earlier call. Any error results in an exception thrown from this function.

**Note** This function assigns a range of global ids usable by the given locality for newly created components. Any of the returned global ids still has to be bound to a local address, either by calling `bind` or `bind_range`.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `l`: [in] The locality the locality id needs to be generated for. Repeating calls using the same locality results in identical `locality_id` values.
- `count`: [in] The number of global ids to be generated.
- `lower_bound`: [out] The lower bound of the assigned id range. The returned value can be used as the first id to assign. This is valid only, if the return value of this function is `true`.
- `upper_bound`: [out] The upper bound of the assigned id range. The returned value can be used as the last id to assign. This is valid only, if the return value of this function is `true`.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
bool bind_local (naming::gid_type const &id, naming::address const &addr, error_code
 &ec = throws)
Bind a global address to a local address.
```

Every element in the HPX namespace has a unique global address (global id). This global address has to be associated with a concrete local address to be able to address an instance of a component using its global address.

**Return** This function returns *true*, if this global id got associated with an local address. It returns *false* otherwise.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Note** Binding a gid to a local address sets its global reference count to one.

#### Parameters

- *id*: [in] The global address which has to be bound to the local address.
- *addr*: [in] The local address to be bound to the global address.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
hpx::future<bool> bind_async(naming::gid_type const &id, naming::address const &addr, std::uint32_t locality_id)
```

```
hpx::future<bool> bind_async(naming::gid_type const &id, naming::address const &addr, naming::gid_type const &locality)
```

```
bool bind_range_local(naming::gid_type const &lower_id, std::uint64_t count, naming::address const &baseaddr, std::uint64_t offset, error_code &ec = throws)
```

Bind unique range of global ids to given base address.

Every locality needs to be able to bind global ids to different components without having to consult the AGAS server for every id to bind. This function can be called to bind a range of consecutive global ids to a range of consecutive local addresses (separated by a given *offset*).

**Return** This function returns *true*, if the given range was successfully bound. It returns *false* otherwise.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Note** Binding a gid to a local address sets its global reference count to one.

#### Parameters

- *lower\_id*: [in] The lower bound of the assigned id range. The value can be used as the first id to assign.
- *count*: [in] The number of consecutive global ids to bind starting at *lower\_id*.
- *baseaddr*: [in] The local address to bind to the global id given by *lower\_id*. This is the base address for all additional local addresses to bind to the remaining global ids.
- *offset*: [in] The offset to use to calculate the local addresses to be bound to the range of global ids.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
hpx::future<bool> bind_range_async(naming::gid_type const &lower_id, std::uint64_t count, naming::address const &baseaddr, std::uint64_t offset, naming::gid_type const &locality)
```

```
hpx::future<bool> bind_range_async(naming::gid_type const &lower_id, std::uint64_t count, naming::address const &baseaddr, std::uint64_t offset, std::uint32_t locality_id)
```

```
bool unbind_local(naming::gid_type const &id, error_code &ec = throws)
```

Unbind a global address.

Remove the association of the given global address with any local address, which was bound to this global address. Additionally it returns the local address which was bound at the time of this call.

**Return** The function returns *true* if the association has been removed, and it returns *false* if no association existed. Any error results in an exception thrown from this function.

**Note** You can unbind only global ids bound using the function *bind*. Do not use this function to unbind any of the global ids bound using *bind\_range*.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Note** This function will raise an error if the global reference count of the given gid is not zero! TODO: confirm that this happens.

#### Parameters

- *id*: [in] The global address (id) for which the association has to be removed.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
bool unbind_local (naming::gid_type const &id, naming::address &addr, error_code &ec
 = throws)
```

Unbind a global address.

Remove the association of the given global address with any local address, which was bound to this global address. Additionally it returns the local address which was bound at the time of this call.

**Return** The function returns *true* if the association has been removed, and it returns *false* if no association existed. Any error results in an exception thrown from this function.

**Note** You can unbind only global ids bound using the function *bind*. Do not use this function to unbind any of the global ids bound using *bind\_range*.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Note** This function will raise an error if the global reference count of the given gid is not zero! TODO: confirm that this happens.

#### Parameters

- *id*: [in] The global address (id) for which the association has to be removed.
- *addr*: [out] The local address which was associated with the given global address (id). This is valid only if the return value of this function is true.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
bool unbind_range_local (naming::gid_type const &lower_id, std::uint64_t count, er-
 ror_code &ec = throws)
```

Unbind the given range of global ids.

**Return** This function returns *true* if a new range has been generated (it has been called for the first time for the given locality) and returns *false* if this locality already got a range assigned in an earlier call. Any error results in an exception thrown from this function.

**Note** You can unbind only global ids bound using the function *bind\_range*. Do not use this function to unbind any of the global ids bound using *bind*.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Note** This function will raise an error if the global reference count of the given gid is not zero! TODO: confirm that this happens.

#### Parameters

- *lower\_id*: [in] The lower bound of the assigned id range. The value must be the first id of the range as specified to the corresponding call to *bind\_range*.
- *count*: [in] The number of consecutive global ids to unbind starting at *lower\_id*. This number must be identical to the number of global ids bound by the corresponding call to

*bind\_range*

- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
bool unbind_range_local(naming::gid_type const &lower_id, std::uint64_t count, naming::address &addr, error_code &ec = throws)
```

Unbind the given range of global ids.

**Return** This function returns *true* if a new range has been generated (it has been called for the first time for the given locality) and returns *false* if this locality already got a range assigned in an earlier call.

**Note** You can unbind only global ids bound using the function *bind\_range*. Do not use this function to unbind any of the global ids bound using *bind*.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Note** This function will raise an error if the global reference count of the given gid is not zero!

#### Parameters

- *lower\_id*: [in] The lower bound of the assigned id range. The value must be the first id of the range as specified to the corresponding call to *bind\_range*.
- *count*: [in] The number of consecutive global ids to unbind starting at *lower\_id*. This number must be identical to the number of global ids bound by the corresponding call to *bind\_range*
- *addr*: [out] The local address which was associated with the given global address (*id*). This is valid only if the return value of this function is *true*.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
hpx::future<naming::address> unbind_range_async(naming::gid_type const &lower_id, std::uint64_t count = 1)
```

```
bool is_local_address_cached(naming::gid_type const &id, error_code &ec = throws)
```

Test whether the given address refers to a local object.

This function will test whether the given address refers to an object living on the locality of the caller.

**Return** This function returns *true* if the passed address refers to an object which lives on the locality of the caller.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *addr*: [in] The address to test.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
bool is_local_address_cached(naming::gid_type const &id, naming::address &addr, error_code &ec = throws)
```

```
bool is_local_lva_encoded_address(std::uint64_t msb)
```

```
bool resolve_local(naming::gid_type const &id, naming::address &addr, error_code &ec = throws)
```

Resolve a given global address (*id*) to its associated local address.

This function returns the local address which is currently associated with the given global address (*id*).

**Return** This function returns *true* if the global address has been resolved successfully (there exists an association to a local address) and the associated local address has been returned. The function returns *false* if no association exists for the given global address. Any error results in an exception thrown from this function.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *id*: [in] The global address (*id*) for which the associated local address should be returned.
- *addr*: [out] The local address which currently is associated with the given global address (*id*), this is valid only if the return value of this function is true.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
bool resolve_local (naming::id_type const &id, naming::address &addr, error_code &ec
 = throws)
naming::address resolve_local (naming::gid_type const &id, error_code &ec = throws)
naming::address resolve_local (naming::id_type const &id, error_code &ec = throws)
hpx::future<naming::address> resolve_async (naming::gid_type const &id)
hpx::future<naming::address> resolve_async (naming::id_type const &id)
hpx::future<naming::id_type> get_colocation_id_async (naming::id_type const
 &id)
bool resolve_full_local (naming::gid_type const &id, naming::address &addr, er-
 ror_code &ec = throws)
bool resolve_full_local (naming::id_type const &id, naming::address &addr, er-
 ror_code &ec = throws)
naming::address resolve_full_local (naming::gid_type const &id, error_code &ec =
 throws)
naming::address resolve_full_local (naming::id_type const &id, error_code &ec =
 throws)
hpx::future<naming::address> resolve_full_async (naming::gid_type const &id)
hpx::future<naming::address> resolve_full_async (naming::id_type const &id)
bool resolve_cached (naming::gid_type const &id, naming::address &addr, error_code
 &ec = throws)
bool resolve_cached (naming::id_type const &id, naming::address &addr, error_code
 &ec = throws)
bool resolve_local (naming::gid_type const *gids, naming::address *addrs, std::size_t
 size, boost::dynamic_bitset<> &locals, error_code &ec = throws)
bool resolve_full_local (naming::gid_type const *gids, naming::address *addrs,
 std::size_t size, boost::dynamic_bitset<> &locals, error_code
 &ec = throws)
bool resolve_cached (naming::gid_type const *gids, naming::address *addrs, std::size_t
 size, boost::dynamic_bitset<> &locals, error_code &ec = throws)
```

```
lcos::future<std::int64_t> incref_async (naming::gid_type const &gid, std::int64_t credits = 1, naming::id_type const &keep_alive = naming::invalid_id)
```

Increment the global reference count for the given id.

**Return** Whether the operation was successful.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *id*: [in] The global address (id) for which the global reference count has to be incremented.
- *credits*: [in] The number of reference counts to add for the given id.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
std::int64_t incref (naming::gid_type const &gid, std::int64_t credits = 1, error_code &ec = throws)
```

```
void decref (naming::gid_type const &id, std::int64_t credits = 1, error_code &ec = throws)
```

Decrement the global reference count for the given id.

**Return** The global reference count after the decrement.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *id*: [in] The global address (id) for which the global reference count has to be decremented.
- *t*: [out] If this was the last outstanding global reference for the given gid (the return value of this function is zero), *t* will be set to the component type of the corresponding element. Otherwise *t* will not be modified.
- *credits*: [in] The number of reference counts to add for the given id.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
hpx::future<iterate_names_return_type> iterate_ids (std::string const &pattern)
```

Invoke the supplied *hpx::function* for every registered global name.

This function iterates over all registered global ids and returns every found entry matching the given name pattern. Any error results in an exception thrown (or reported) from this function.

#### Parameters

- *pattern*: [in] pattern (possibly using wildcards) to match all existing entries against

```
bool register_name (std::string const &name, naming::gid_type const &id, error_code &ec = throws)
```

Register a global name with a global address (id)

This function registers an association between a global name (string) and a global address (id) usable with one of the functions above (bind, unbind, and resolve).

**Return** The function returns *true* if the global name was registered. It returns false if the global name is not registered.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *name*: [in] The global name (string) to be associated with the global address.
- *id*: [in] The global address (id) to be associated with the global address.

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`lcos::future<bool> register_name_async (std::string const &name, naming::id_type const &id)`

`bool register_name (std::string const &name, naming::id_type const &id, error_code &ec = throws)`

`lcos::future<naming::id_type> unregister_name_async (std::string const &name)`

Unregister a global name (release any existing association)

This function releases any existing association of the given global name with a global address (id).

**Return** The function returns *true* if an association of this global name has been released, and it returns *false*, if no association existed. Any error results in an exception thrown from this function.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `name`: [in] The global name (string) for which any association with a global address (id) has to be released.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`naming::id_type unregister_name (std::string const &name, error_code &ec = throws)`

`lcos::future<naming::id_type> resolve_name_async (std::string const &name)`

Query for the global address associated with a given global name.

This function returns the global address associated with the given global name.

This function returns true if it returned global address (id), which is currently associated with the given global name, and it returns false, if currently there is no association for this global name. Any error results in an exception thrown from this function.

**Return** [out] The id currently associated with the given global name (valid only if the return value is true).

#### Parameters

- `name`: [in] The global name (string) for which the currently associated global address has to be retrieved.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

`naming::id_type resolve_name (std::string const &name, error_code &ec = throws)`

`future<hpx::id_type> on_symbol_namespace_event (std::string const &name, bool call_for_past_events = false)`

Install a listener for a given symbol namespace event.

This function installs a listener for a given symbol namespace event. It returns a future which becomes ready as a result of the listener being triggered.

**Return** A future instance encapsulating the global id which is causing the registered listener to be triggered.

**Note** The only event type which is currently supported is *symbol\_ns\_bind*, i.e. the listener is triggered whenever a global id is registered with the given name.

**Parameters**

- `name`: [in] The global name (string) for which the given event should be triggered.
- `evt`: [in] The event for which a listener should be installed.
- `call_for_past_events`: [in, optional] Trigger the listener even if the given event has already happened in the past. The default for this parameter is *false*.

```

### agas\_base

The contents of this module can be included with the header `hpx/modules/agas_base.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/agas_base.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

**namespace hpx**

AGAS's primary namespace maps 128-bit global identifiers (GIDs) to resolved addresses.

The following is the canonical description of the partitioning of AGAS's primary namespace.

```
|-----MSB-----| |-----LSB-----|
BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB
|prefix||RC||----identifier----|
MSB - Most significant bits (bit 64 to bit 127)
LSB - Least significant bits (bit 0 to bit 63)
prefix - Highest 32 bits (bit 96 to bit 127) of the MSB. Each
 locality is assigned a prefix. This creates a 96-bit
 address space for each locality.
RC - Bit 88 to bit 92 of the MSB. This is the log2 of the number
 of reference counting credits on the GID.
 Bit 93 is used by the locking scheme for gid_types.
 Bit 94 is a flag which is set if the credit value is valid.
 Bit 95 is a flag that is set if a GID's credit count is
 ever split (e.g. if the GID is ever passed to another
 locality).
 - Bit 87 marks the gid such that it will not be stored in
 any of the AGAS caches. This is used mainly for ids
 which represent 'one-shot' objects (like promises).
identifier - Bit 64 to bit 86 of the MSB, and the entire LSB. The
 content of these bits depends on the component type of
 the underlying object. For all user-defined components,
 these bits contain a unique 88-bit number which is
 assigned sequentially for each locality. For
 \a hpx#components#component_runtime_support the high 24
 bits are zeroed and the low 64 bits hold the LVA of the
 component.
```

**Note** The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned GIDs will be unique.

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

```
00000000xxxxxxxxxxxxxxxxxxxxxx
Historically unused address space reserved for future use.
xxxxxxxxxxxx000xxxxxxxxxxxxxx
Address space for LVA-encoded GIDs.
00000001xxxxxxxxxxxxxxxxxxxxxx
Prefix of the bootstrap AGAS locality.
000000010000000100000000000001
Address of the primary_namespace component on the bootstrap AGAS
locality.
00000001000000010000000000000002
Address of the component_namespace component on the bootstrap AGAS
locality.
00000001000000010000000000000003
Address of the symbol_namespace component on the bootstrap AGAS
locality.
00000001000000010000000000000004
```

(continues on next page)

(continued from previous page)

Address of the `locality_namespace` component on the bootstrap AGAS locality.

**namespace hpx**

AGAS's primary namespace maps 128-bit global identifiers (GIDs) to resolved addresses.

The following is the canonical description of the partitioning of AGAS's primary namespace.

- MSB - Most significant bits (bit 64 to bit 127)
- LSB - Least significant bits (bit 0 to bit 63)
- prefix - Highest 32 bits (bit 96 to bit 127) of the MSB. Each locality is assigned a prefix. This creates a 96-bit address space for each locality.
- RC - Bit 88 to bit 92 of the MSB. This is the log<sub>2</sub> of the number of reference counting credits on the GID.

(continues on next page)

(continued from previous page)

Bit 93 is used by the locking scheme for `gid_types`.  
 Bit 94 is a flag which is set if the credit value is valid.  
 Bit 95 is a flag that is set if a GID's credit count is ever split (e.g. if the GID is ever passed to another locality).  

- Bit 87 marks the gid such that it will not be stored in any of the AGAS caches. This is used mainly for ids which represent 'one-shot' objects (like promises).

`identifier` - Bit 64 to bit 86 of the MSB, and the entire LSB. The content of these bits depends on the component type of the underlying object. For all user-defined components, these bits contain a unique 88-bit number which is assigned sequentially for each locality. For `\a hpx#components#component_runtime_support` the high 24 bits are zeroed and the low 64 bits hold the LVA of the component.

**Note** The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned GIDs will be unique.

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

```
00000000xxxxxxxxxxxxxxxxxxxxxx
Historically unused address space reserved for future use.
xxxxxxxxxxxx0000xxxxxxxxxxxxxx
Address space for LVA-encoded GIDs.
00000001xxxxxxxxxxxxxxxxxxxxxx
Prefix of the bootstrap AGAS locality.
00000000100000000100000000000001
Address of the primary_namespace component on the bootstrap AGAS
locality.
0000000010000000010000000000000002
Address of the component_namespace component on the bootstrap AGAS
locality.
0000000010000000010000000000000003
Address of the symbol_namespace component on the bootstrap AGAS
locality.
0000000010000000010000000000000004
Address of the locality_namespace component on the bootstrap AGAS
locality.
```

**namespace agas**

```
struct component_namespace
```

| prefix     | - Highest 32 bits (bit 96 to bit 127) of the MSB. Each locality is assigned a prefix. This creates a 96-bit address space for each locality.                                                                                                                                                                                                                                                                                                                                                                                               |
| RC         | - Bit 88 to bit 92 of the MSB. This is the log <sub>2</sub> of the number of reference counting credits on the GID.<br>Bit 93 is used by the locking scheme for gid_types.<br>Bit 94 is a flag which is set if the credit value is valid.<br>Bit 95 is a flag that is set if a GID's credit count is ever split (e.g. if the GID is ever passed to another locality).<br>- Bit 87 marks the gid such that it will not be stored in any of the AGAS caches. This is used mainly for ids which represent 'one-shot' objects (like promises). |
| identifier | - Bit 64 to bit 86 of the MSB, and the entire LSB. The                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

(continues on next page)

(continued from previous page)

content of these bits depends on the component type of the underlying object. For all user-defined components, these bits contain a unique 88-bit number which is assigned sequentially for each locality. For \a hpx#components#component\_runtime\_support the high 24 bits are zeroed and the low 64 bits hold the LVA of the component.

**Note** The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned GIDs will be unique.

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

```
00000000xxxxxxxxxxxxxxxxxxxxxx
Historically unused address space reserved for future use.
xxxxxxxxxxxx0000xxxxxxxxxxxxxx
Address space for LVA-encoded GIDs.
00000001xxxxxxxxxxxxxxxxxxxxxx
Prefix of the bootstrap AGAS locality.
00000001000000001000000000000001
Address of the primary_namespace component on the bootstrap AGAS
locality.
0000000100000000100000000000000002
Address of the component_namespace component on the bootstrap AGAS
locality.
0000000100000000100000000000000003
Address of the symbol_namespace component on the bootstrap AGAS
locality.
0000000100000000100000000000000004
Address of the locality_namespace component on the bootstrap AGAS
locality.

**namespace hpx**

AGAS's primary namespace maps 128-bit global identifiers (GIDs) to resolved addresses.

The following is the canonical description of the partitioning of AGAS's primary namespace.

```
|-----MSB-----| |-----LSB-----|
BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB
|prefix||RC||----identifier----|
MSB - Most significant bits (bit 64 to bit 127)
LSB - Least significant bits (bit 0 to bit 63)
prefix - Highest 32 bits (bit 96 to bit 127) of the MSB. Each
 locality is assigned a prefix. This creates a 96-bit
 address space for each locality.
RC - Bit 88 to bit 92 of the MSB. This is the log2 of the number
 of reference counting credits on the GID.
 Bit 93 is used by the locking scheme for gid_types.
 Bit 94 is a flag which is set if the credit value is valid.
 Bit 95 is a flag that is set if a GID's credit count is
 ever split (e.g. if the GID is ever passed to another
 locality).
 - Bit 87 marks the gid such that it will not be stored in
 any of the AGAS caches. This is used mainly for ids
 which represent 'one-shot' objects (like promises).
identifier - Bit 64 to bit 86 of the MSB, and the entire LSB. The
 content of these bits depends on the component type of
 the underlying object. For all user-defined components,
 these bits contain a unique 88-bit number which is
 assigned sequentially for each locality. For
 \a hpx#components#component_runtime_support the high 24
 bits are zeroed and the low 64 bits hold the LVA of the
 component.
```

**Note** The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned GIDs will be unique.

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

```
00000000xxxxxxxxxxxxxxxxxxxxxx
Historically unused address space reserved for future use.
xxxxxxxxxxxx000xxxxxxxxxxxxxx

| MSB           - Most significant bits (bit 64 to bit 127)                                                                                                                                                                                                                                                                                                                                                   |
| LSB           - Least significant bits (bit 0 to bit 63)                                                                                                                                                                                                                                                                                                                                                    |
| prefix        - Highest 32 bits (bit 96 to bit 127) of the MSB. Each locality is assigned a prefix. This creates a 96-bit address space for each locality.                                                                                                                                                                                                                                                  |
| RC            - Bit 88 to bit 92 of the MSB. This is the log2 of the number of reference counting credits on the GID.<br>Bit 93 is used by the locking scheme for gid_types.<br>Bit 94 is a flag which is set if the credit value is valid.<br>Bit 95 is a flag that is set if a GID's credit count is ever split (e.g. if the GID is ever passed to another locality).                                     |
|                                                                                                                                                                                                                                                                                                                                                                                                             |
| identifier - Bit 64 to bit 86 of the MSB, and the entire LSB. The content of these bits depends on the component type of the underlying object. For all user-defined components, these bits contain a unique 88-bit number which is assigned sequentially for each locality. For \a hpx#components#component_runtime_support the high 24 bits are zeroed and the low 64 bits hold the LVA of the component. |

**Note** The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned GIDs will be unique.

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

```
00000000xxxxxxxxxxxxxxxxxxxxxx
 Historically unused address space reserved for future use.
xxxxxxxxxx0000xxxxxxxxxxxxxx
 Address space for LVA-encoded GIDs.
00000001xxxxxxxxxxxxxxxxxxxxxx
 Prefix of the bootstrap AGAS locality.
000000010000000010000000000000000001
 Address of the primary_namespace component on the bootstrap AGAS
 locality.
00000001000000001000000000000000000002
 Address of the component_namespace component on the bootstrap AGAS
 locality.
00000001000000001000000000000000000003
 Address of the symbol_namespace component on the bootstrap AGAS
 locality.
00000001000000001000000000000000000004
 Address of the locality_namespace component on the bootstrap AGAS
 locality.
```

**namespace agas**

```
struct symbol_namespace
```

### Public Types

```
using server_type = server::symbol_namespace
using iterate_names_return_type = std::map<std::string, naming::id_type>
```

### Public Functions

```

static naming::gid_type get_service_instance (naming::id_type const &dest)
static bool is_service_instance (naming::gid_type const &gid)
static bool is_service_instance (naming::id_type const &id)
static naming::id_type symbol_namespace_locality (std::string const &key)

```

## Private Members

```

std::unique_ptr<server_type> server_
namespace hpx
AGAS's primary namespace maps 128-bit global identifiers (GIDs) to resolved addresses.

```

The following is the canonical description of the partitioning of AGAS's primary namespace.

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

(continued from previous page)

the underlying object. For all user-defined components, these bits contain a unique 88-bit number which is assigned sequentially for each locality. For \a hpx#components#component\_runtime\_support the high 24 bits are zeroed and the low 64 bits hold the LVA of the component.

**Note** The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned GIDs will be unique.

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

```
00000000xxxxxxxxxxxxxxxxxxxxxx
Historically unused address space reserved for future use.
xxxxxxxxxxxx0000xxxxxxxxxxxxxx
Address space for LVA-encoded GIDs.
00000001xxxxxxxxxxxxxxxxxxxxxx
Prefix of the bootstrap AGAS locality.
000000010000000010000000000000000001
Address of the primary_namespace component on the bootstrap AGAS
locality.
000000010000000010000000000000000002
Address of the component_namespace component on the bootstrap AGAS
locality.
000000010000000010000000000000000003
Address of the symbol_namespace component on the bootstrap AGAS
locality.
000000010000000010000000000000000004
Address of the locality_namespace component on the bootstrap AGAS
locality.

### namespace hpx

AGAS's primary namespace maps 128-bit global identifiers (GIDs) to resolved addresses.

The following is the canonical description of the partitioning of AGAS's primary namespace.

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| LSB        | - Least significant bits (bit 0 to bit 63)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| prefix     | - Highest 32 bits (bit 96 to bit 127) of the MSB. Each locality is assigned a prefix. This creates a 96-bit address space for each locality.                                                                                                                                                                                                                                                                                                                                                                                               |
| RC         | - Bit 88 to bit 92 of the MSB. This is the log <sub>2</sub> of the number of reference counting credits on the GID.<br>Bit 93 is used by the locking scheme for gid_types.<br>Bit 94 is a flag which is set if the credit value is valid.<br>Bit 95 is a flag that is set if a GID's credit count is ever split (e.g. if the GID is ever passed to another locality).<br>- Bit 87 marks the gid such that it will not be stored in any of the AGAS caches. This is used mainly for ids which represent 'one-shot' objects (like promises). |
| identifier | - Bit 64 to bit 86 of the MSB, and the entire LSB. The content of these bits depends on the component type of the underlying object. For all user-defined components, these bits contain a unique 88-bit number which is assigned sequentially for each locality. For \a hpx#components#component_runtime_support the high 24 bits are zeroed and the low 64 bits hold the LVA of the component.                                                                                                                                           |

**Note** The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned GIDs will be unique.

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

|                                    |                                                                              |
|------------------------------------|------------------------------------------------------------------------------|
| 00000000xxxxxxxxxxxxxxxxxxxxxxxx   | Historically unused address space reserved <b>for</b> future use.            |
| xxxxxxxxxxxx0000xxxxxxxxxxxx       | Address space <b>for</b> LVA-encoded GIDs.                                   |
| 00000001xxxxxxxxxxxxxxxxxxxxxx     | Prefix of the bootstrap AGAS locality.                                       |
| 00000001000000001000000000000001   | Address of the primary_namespace component on the bootstrap AGAS locality.   |
| 0000000100000000100000000000000002 | Address of the component_namespace component on the bootstrap AGAS locality. |
| 0000000100000000100000000000000003 | Address of the symbol_namespace component on the bootstrap AGAS locality.    |
| 0000000100000000100000000000000004 | Address of the locality_namespace component on the bootstrap AGAS locality.  |

AGAS's primary namespace maps 128-bit global identifiers (GIDs) to resolved addresses.

The following is the canonical description of the partitioning of AGAS's primary namespace.

|                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### namespace hpx

AGAS's primary namespace maps 128-bit global identifiers (GIDs) to resolved addresses.

The following is the canonical description of the partitioning of AGAS's primary namespace.

|                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -----MSB-----   -----LSB-----                                                                                                                                                                                                                                                                                                                                           |
| BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB                                                                                                                                                                                                                                                                                                                                |
| prefix  RC   ---identifier---                                                                                                                                                                                                                                                                                                                                           |
|                                                                                                                                                                                                                                                                                                                                                                         |
| MSB           - Most significant bits (bit 64 to bit 127)                                                                                                                                                                                                                                                                                                               |
| LSB           - Least significant bits (bit 0 to bit 63)                                                                                                                                                                                                                                                                                                                |
| prefix        - Highest 32 bits (bit 96 to bit 127) of the MSB. Each locality is assigned a prefix. This creates a 96-bit address space for each locality.                                                                                                                                                                                                              |
| RC            - Bit 88 to bit 92 of the MSB. This is the log2 of the number of reference counting credits on the GID.<br>Bit 93 is used by the locking scheme for gid_types.<br>Bit 94 is a flag which is set if the credit value is valid.<br>Bit 95 is a flag that is set if a GID's credit count is ever split (e.g. if the GID is ever passed to another locality). |
|                                                                                                                                                                                                                                                                                                                                                                         |
| - Bit 87 marks the gid such that it will not be stored in any of the AGAS caches. This is used mainly for ids which represent 'one-shot' objects (like promises).                                                                                                                                                                                                       |
| identifier - Bit 64 to bit 86 of the MSB, and the entire LSB. The content of these bits depends on the component type of the underlying object. For all user-defined components,                                                                                                                                                                                        |

(continues on next page)

(continued from previous page)

these bits contain a unique 88-bit number which is assigned sequentially for each locality. For \a hpx#components#component\_runtime\_support the high 24 bits are zeroed and the low 64 bits hold the LVA of the component.

**Note** The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned GIDs will be unique.

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

```
00000000xxxxxxxxxxxxxxxxxxxxxx
 Historically unused address space reserved for future use.
xxxxxxxxxxxx0000xxxxxxxxxxxxxx
 Address space for LVA-encoded GIDs.
00000001xxxxxxxxxxxxxxxxxxxxxx
 Prefix of the bootstrap AGAS locality.
00000001000000001000000000000001
 Address of the primary_namespace component on the bootstrap AGAS
 locality.
0000000100000000100000000000000002
 Address of the component_namespace component on the bootstrap AGAS
 locality.
0000000100000000100000000000000003
 Address of the symbol_namespace component on the bootstrap AGAS
 locality.
0000000100000000100000000000000004
 Address of the locality_namespace component on the bootstrap AGAS
 locality.

## async\_colocated

The contents of this module can be included with the header `hpx/modules/async_colocated.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/async_colocated.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX API*.

## Defines

```
HPX_REGISTER_ASYNC_COLOCATED_DECLARATION(Action, Name)
```

```
HPX_REGISTER_ASYNC_COLOCATED(Action, Name)
```

```
namespace hpx
```

## Functions

```
naming::id_type get_colocation_id(launch::sync_policy, naming::id_type const &id, error_code &ec = throws)
```

Return the id of the locality where the object referenced by the given id is currently located on.

The function `hpx::get_colocation_id()` returns the id of the locality where the given object is currently located.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

See `hpx::get_colocation_id()`

#### Parameters

- `id`: [in] The id of the object to locate.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`lcos::future<naming::id_type> get_colocation_id(naming::id_type const &id)`

Asynchronously return the id of the locality where the object referenced by the given id is currently located on.

See `hpx::get_colocation_id(launch::sync_policy)`

#### Parameters

- `id`: [in] The id of the object to locate.

```

## Public Static Functions

```
static lcos::base_lco *call (naming::address_type lva)
template<>
struct get_lva<lcos::base_lco const>
```

## Public Static Functions

```
static lcos::base_lco const *call (naming::address_type lva)
namespace lcos
```

### class base\_lco

#include <base\_lco.hpp> The base\_lco class is the common base class for all LCO's implementing a simple set\_event action

Subclassed by hpx::lcos::base\_lco\_with\_value< Result, RemoteResult, ComponentTag >, hpx::lcos::base\_lco\_with\_value< void, void, ComponentTag >

## Public Types

```
typedef components::managed_component<base_lco> wrapping_type
typedef base_lco base_type_holder
```

## Public Functions

```
virtual void set_event() = 0

virtual void set_exception(std::exception_ptr const &e)

virtual void connect(naming::id_type const&)

virtual void disconnect(naming::id_type const&)

virtual ~base_lco()
 Destructor, needs to be virtual to allow for clean destruction of derived objects

virtual void finalize()
 finalize() will be called just before the instance gets destructed

void set_event_nonvirt()
 The function set_event_nonvirt is called whenever a set_event_action is applied on a instance of a LCO. This function just forwards to the virtual function set_event, which is overloaded by the derived concrete LCO.

void set_exception_nonvirt(std::exception_ptr const &e)
 The function set_exception is called whenever a set_exception_action is applied on a instance of a LCO. This function just forwards to the virtual function set_exception, which is overloaded by the derived concrete LCO.
```

### Parameters

- e: [in] The exception encapsulating the error to report to this LCO instance.

```
void connect_nonvirt(naming::id_type const &id)
```

The function connect\_nonvirt is called whenever a connect\_action is applied on a instance of a LCO. This function just forwards to the virtual function connect, which is overloaded by the derived concrete LCO.

### Parameters

- id: [in] target id

```
void disconnect_nonvirt(naming::id_type const &id)
```

The function disconnect\_nonvirt is called whenever a disconnect\_action is applied on a instance of a LCO. This function just forwards to the virtual function disconnect, which is overloaded by the derived concrete LCO.

### Parameters

- id: [in] target id

```
HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco, set_event_nonvirt,
 set_event_action)
```

Each of the exposed functions needs to be encapsulated into an action type, allowing to generate all required boilerplate code for threads, serialization, etc.

The set\_event\_action may be used to unconditionally trigger any LCO instances, it carries no additional parameters.

```
HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco, set_exception_nonvirt,
 set_exception_action)
```

The *set\_exception\_action* may be used to transfer arbitrary error information from the remote site to the LCO instance specified as a continuation. This action carries 2 parameters:

#### Parameters

- `std::exception_ptr`: [in] The exception encapsulating the error to report to this LCO instance.

```
HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco, connect_nonvirt, connect_action)
```

The *connect\_action* may be used to.

```
HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco, disconnect_nonvirt, disconnect_action)
```

The *set\_exception\_action* may be used to.

```

```
HPX_REGISTER_BASE_LCO_WITH_VALUE_ID_6 (Value, RemoteValue, Name, ActionIdGet, ActionIdSet, Tag)
```

```
namespace hpx
```

```
namespace lcos
```

```
template<typename Result, typename RemoteResult, typename ComponentTag>
class base_lco_with_value : public hpx::lcos::base_lco, public ComponentTag
 #include <base_lco_with_value.hpp> The base_lco_with_value class is the common base class for
 all LCO's synchronizing on a value. The RemoteResult template argument should be set to the type
 of the argument expected for the set_value action.
```

### Template Parameters

- *RemoteResult*: The type of the result value to be carried back to the LCO instance.
- *ComponentTag*: The tag type representing the type of the component (either *component\_tag* or *managed\_component\_tag*).

### Public Types

```
template<>
using wrapping_type = typename detail::base_lco_wrapping_type<ComponentTag, base_lco_with_value>::ty
template<>
using base_type_holder = base_lco_with_value
```

### Public Functions

```
void set_value_nonvirt (RemoteResult &&result)
```

The *function* *set\_value\_nonvirt* is called whenever a *set\_value\_action* is applied on this LCO instance. This function just forwards to the virtual function *set\_value*, which is overloaded by the derived concrete LCO.

#### Parameters

- *result*: [in] The result value to be transferred from the remote operation back to this LCO instance.

```
Result get_value_nonvirt ()
```

The *function* *get\_result\_nonvirt* is called whenever a *get\_result\_action* is applied on this LCO instance. This function just forwards to the virtual function *get\_result*, which is overloaded by the derived concrete LCO.

```
HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco_with_value, set_value_nonvirt,
 set_value_action)
```

The *set\_value\_action* may be used to trigger any LCO instances while carrying an additional parameter of any type.

*RemoteResult* is taken by rvalue ref. This allows for perfect forwarding. When the action thread function is created, the values are moved into the called function. If we took it by const lvalue reference, we would disable the possibility to further move the result to the designated destination.

#### Parameters

- *RemoteResult*: [in] The type of the result to be transferred back to this LCO instance.

---

```
HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco_with_value, get_value_nonvirt,
 get_value_action)
```

The *get\_value\_action* may be used to query the value this LCO instance exposes as its ‘result’ value.

## Public Static Functions

```
static components::component_type get_component_type ()
static void set_component_type (components::component_type type)
```

## Protected Types

namespace hpx
```

```
namespace lcos
```

```
template<typename Action, typename Result = typename traits::promise_local_result<typename Action::remote_r
```

```
class packaged_action
#include <packaged_action.hpp> A packaged_action can be used by a single thread to invoke a (remote) action and wait for the result. The result is expected to be sent back to the packaged_action using the LCO's set_event action
```

A *packaged\_action* is one of the simplest synchronization primitives provided by HPX. It allows to synchronize on a eager evaluated remote operation returning a result of the type *Result*.

**Note** The action executed using the *packaged\_action* as a continuation must return a value of a type convertible to the type as specified by the template parameter *Result*.

#### Template Parameters

- *Action*: The template parameter *Action* defines the action to be executed by this *packaged\_action* instance. The arguments *arg0*, ..., *argN* are used as parameters for this action.
- *Result*: The template parameter *Result* defines the type this *packaged\_action* is expected to return from its associated future *packaged\_action::get\_future*.
- *DirectExecute*: The template parameter *DirectExecute* is an optimization aid allowing to execute the action directly if the target is local (without spawning a new thread for this). This template does not have to be supplied explicitly as it is derived from the template parameter *Action*.

```
template<typename Result, typename RemoteResult>
class promise
#include <promise.hpp> A promise can be used by a single thread to invoke a (remote) action and wait for the result. The result is expected to be sent back to the promise using the LCO's set_event action
```

A promise is one of the simplest synchronization primitives provided by HPX. It allows to synchronize on a eager evaluated remote operation returning a result of the type *Result*. The *promise* allows to synchronize exactly one *thread* (the one passed during construction time).

```
// Create the promise (the expected result is a id_type)
lcos::promise<naming::id_type> p;

// Get the associated future
future<naming::id_type> f = p.get_future();

// initiate the action supplying the promise as a
// continuation
apply<some_action>(new continuation(p.get_id()), ...);

// Wait for the result to be returned, yielding control
// in the meantime.
naming::id_type result = f.get();
// ...
```

**Note** The action executed by the promise must return a value of a type convertible to the type as specified by the template parameter *RemoteResult*

#### Template Parameters

- *Result*: The template parameter *Result* defines the type this promise is expected to return from *promise::get*.
- *RemoteResult*: The template parameter *RemoteResult* defines the type this promise is expected to receive from the remote action.

template<>
class promise<void, hpx::util::unused_type> : public detail::promise_base<void, hpx::util::unused_type, detail::promise_data<
```

## Public Functions

```
promise()
 constructs a promise object and a shared state.

template<typename Allocator>
promise (std::allocator_arg_t, Allocator const &a)
 constructs a promise object and a shared state. The constructor uses the allocator a to allocate the memory
 for the shared state.

promise (promise &&other)
 constructs a new promise object and transfers ownership of the shared state of other (if any) to the newly-
 constructed object.
```

**Post** other has no shared state.

```
~promise()
 Abandons any shared state.

promise &operator= (promise &&other)
 Abandons any shared state (30.6.4) and then as if promise(std::move(other)).swap(*this).
```

**Return** \*this.

```
void swap (promise &other)
 Exchanges the shared state of *this and other.
```

**Post** \*this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that \*this had prior to the call to swap.

```
void set_value ()
 atomically stores the value r in the shared state and makes that state ready (30.6.4).
```

### Exceptions

- `future_error`: if its shared state already has a stored value. if shared state has no stored value exception is raised. `promise_already_satisfied` if its shared state already has a stored value or exception. `no_state` if \*this has no shared state.

### Private Types

```
template<>
using base_type = detail::promise_base<void, hpx::util::unused_type, detail::promise_data<void>>

template<typename R, typename Allocator>
struct uses_allocator<hpx::lcos::promise<R>, Allocator> : public true_type
 #include <promise.hpp> Requires: Allocator shall be an allocator (17.6.3.5)

namespace hpx

namespace lcos
```

### Functions

```
template<typename Result, typename RemoteResult>
void swap (promise<Result, RemoteResult> &x, promise<Result, RemoteResult> &y)
```

```
template<>
class promise<void, hpx::util::unused_type> : public detail::promise_base<void, hpx::util::unused_type, detail::promise_data<void>>
```

### Public Functions

```
promise ()
 constructs a promise object and a shared state.
```

```
template<typename Allocator>
promise (std::allocator_arg_t, Allocator const &a)
 constructs a promise object and a shared state. The constructor uses the allocator a to allocate the memory for the shared state.
```

```
promise (promise &&other)
 constructs a new promise object and transfers ownership of the shared state of other (if any) to the newly- constructed object.
```

**Post** other has no shared state.

```
~promise()
```

Abandons any shared state.

```
promise &operator= (promise &&other)
```

Abandons any shared state (30.6.4) and then as if promise(std::move(other)).swap(\*this).

**Return** \*this.

```
void swap (promise &other)
```

Exchanges the shared state of \*this and other.

**Post** \*this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that \*this had prior to the call to swap.

```
void set_value ()
```

atomically stores the value r in the shared state and makes that state ready (30.6.4).

#### Exceptions

- `future_error`: if its shared state already has a stored value. if shared state has no stored value exception is raised. `promise_already_satisfied` if its shared state already has a stored value or exception. `no_state` if \*this has no shared state.

### Private Types

namespace hpx
```

## Functions

```
void trigger_lco_event (naming::id_type const &id, naming::address &&addr, bool
move_credits = true)
Trigger the LCO referenced by the given id.
```

### Parameters

- `id`: [in] This represents the id of the LCO which should be triggered.
- `addr`: [in] This represents the addr of the LCO which should be triggered.
- `move_credits`: [in] If this is set to `true` then it is ok to send all credits in `id` along with the generated message. The default value is `true`.

```
void trigger_lco_event (naming::id_type const &id, bool move_credits = true)
Trigger the LCO referenced by the given id.
```

### Parameters

- `id`: [in] This represents the id of the LCO which should be triggered.
- `move_credits`: [in] If this is set to `true` then it is ok to send all credits in `id` along with the generated message. The default value is `true`.

```
void trigger_lco_event(naming::id_type const &id, naming::address &&addr, naming::id_type
 const &cont, bool move_credits = true)
Trigger the LCO referenced by the given id.
```

#### Parameters

- `id`: [in] This represents the id of the LCO which should be triggered.
- `addr`: [in] This represents the addr of the LCO which should be triggered.
- `cont`: [in] This represents the LCO to trigger after completion.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in `id` along with the generated message. The default value is *true*.

```
void trigger_lco_event(naming::id_type const &id, naming::id_type const &cont, bool
 move_credits = true)
Trigger the LCO referenced by the given id.
```

#### Parameters

- `id`: [in] This represents the id of the LCO which should be triggered.
- `cont`: [in] This represents the LCO to trigger after completion.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in `id` along with the generated message. The default value is *true*.

```
template<typename Result>
void set_lco_value(naming::id_type const &id, naming::address &&addr, Result &&t, bool
 move_credits = true)
Set the result value for the LCO referenced by the given id.
```

#### Parameters

- `id`: [in] This represents the id of the LCO which should receive the given value.
- `addr`: [in] This represents the addr of the LCO which should be triggered.
- `t`: [in] This is the value which should be sent to the LCO.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in `id` along with the generated message. The default value is *true*.

```
template<typename Result>
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type set_lco_value(naming::id_type const &id, naming::address &&addr, Result &&t, bool move_credits = true)
Set the result value for the (managed) LCO referenced by the given id.
```

### Parameters

- `id`: [in] This represents the id of the LCO which should receive the given value.
- `t`: [in] This is the value which should be sent to the LCO.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
template<typename Result>
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type set_lco_value_unman
```

Set the result value for the (unmanaged) LCO referenced by the given id.

### Parameters

- `id`: [in] This represents the id of the LCO which should receive the given value.
- `t`: [in] This is the value which should be sent to the LCO.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
template<typename Result>
void set_lco_value(naming::id_type const &id, naming::address &&addr, Result &&t, naming::id_type const &cont, bool move_credits = true)
```

Set the result value for the LCO referenced by the given id.

### Parameters

- `id`: [in] This represents the id of the LCO which should receive the given value.
- `addr`: [in] This represents the addr of the LCO which should be triggered.
- `t`: [in] This is the value which should be sent to the LCO.
- `cont`: [in] This represents the LCO to trigger after completion.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
template<typename Result>
```

```
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type set_lco_value(naming::address const &id, Result &&t, naming::cont<Result> &cont, bool move_credits = true)
```

Set the result value for the (managed) LCO referenced by the given id.

#### Parameters

- `id`: [in] This represents the id of the LCO which should receive the given value.
- `t`: [in] This is the value which should be sent to the LCO.
- `cont`: [in] This represents the LCO to trigger after completion.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
template<typename Result>
std::enable_if<!std::is_same<typename std::decay<Result>::type, naming::address>::value>::type set_lco_value_unman-
```

Set the result value for the (unmanaged) LCO referenced by the given id.

#### Parameters

- `id`: [in] This represents the id of the LCO which should receive the given value.
- `t`: [in] This is the value which should be sent to the LCO.
- `cont`: [in] This represents the LCO to trigger after completion.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(naming::id_type const &id, naming::address &&addr, std::exception_ptr
 const &e, bool move_credits = true)
Set the error state for the LCO referenced by the given id.
```

#### Parameters

- **id**: [in] This represents the id of the LCO which should receive the error value.
- **addr**: [in] This represents the addr of the LCO which should be triggered.
- **e**: [in] This is the error value which should be sent to the LCO.
- **move\_credits**: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(naming::id_type const &id, naming::address &&addr, std::exception_ptr
 &&e, bool move_credits = true)
Set the error state for the LCO referenced by the given id.
```

#### Parameters

- **id**: [in] This represents the id of the LCO which should receive the error value.
- **addr**: [in] This represents the addr of the LCO which should be triggered.
- **e**: [in] This is the error value which should be sent to the LCO.
- **move\_credits**: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(naming::id_type const &id, std::exception_ptr const &e, bool move_credits
 = true)
Set the error state for the LCO referenced by the given id.
```

#### Parameters

- **id**: [in] This represents the id of the LCO which should receive the error value.
- **e**: [in] This is the error value which should be sent to the LCO.
- **move\_credits**: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(naming::id_type const &id, std::exception_ptr &&e, bool move_credits =
 true)
Set the error state for the LCO referenced by the given id.
```

#### Parameters

- **id**: [in] This represents the id of the LCO which should receive the error value.
- **e**: [in] This is the error value which should be sent to the LCO.
- **move\_credits**: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(naming::id_type const &id, naming::address &&addr, std::exception_ptr
 const &e, naming::id_type const &cont, bool move_credits = true)
Set the error state for the LCO referenced by the given id.
```

### Parameters

- `id`: [in] This represents the id of the LCO which should receive the error value.
- `addr`: [in] This represents the addr of the LCO which should be triggered.
- `e`: [in] This is the error value which should be sent to the LCO.
- `cont`: [in] This represents the LCO to trigger after completion.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(naming::id_type const &id, naming::address &&addr, std::exception_ptr
 &&e, naming::id_type const &cont, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

### Parameters

- `id`: [in] This represents the id of the LCO which should receive the error value.
- `addr`: [in] This represents the addr of the LCO which should be triggered.
- `e`: [in] This is the error value which should be sent to the LCO.
- `cont`: [in] This represents the LCO to trigger after completion.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(naming::id_type const &id, std::exception_ptr const &e, naming::id_type const
 &cont, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

### Parameters

- `id`: [in] This represents the id of the LCO which should receive the error value.
- `e`: [in] This is the error value which should be sent to the LCO.
- `cont`: [in] This represents the LCO to trigger after completion.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(naming::id_type const &id, std::exception_ptr &&e, naming::id_type const
 &cont, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

### Parameters

- `id`: [in] This represents the id of the LCO which should receive the error value.
- `e`: [in] This is the error value which should be sent to the LCO.
- `cont`: [in] This represents the LCO to trigger after completion.
- `move_credits`: [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

### checkpoint

The contents of this module can be included with the header `hpx/modules/checkpoint.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/checkpoint.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

This header defines the `save_checkpoint` and `restore_checkpoint` functions. These functions are designed to help HPX application developer's checkpoint their applications. `Save_checkpoint` serializes one or more objects and saves them as a byte stream. `Restore_checkpoint` converts the byte stream back into instances of the objects.

```
namespace hpx
```

```
namespace util
```

### Functions

```
std::ostream &operator<< (std::ostream &ost, checkpoint const &ckp)
 Operator<< Overload
```

This overload is the main way to write data from a checkpoint to an object such as a file. Inside the function, the size of the checkpoint will be written to the stream before the checkpoint's data. The `operator>>` overload uses this to read the correct number of bytes. Be mindful of this additional write and read when you use different facilities to write out or read in data to a checkpoint!

#### Parameters

- `ost`: Output stream to write to.
- `ckp`: Checkpoint to copy from.

**Return** `Operator<<` returns the `ostream` object.

```
std::istream &operator>> (std::istream &ist, checkpoint &ckp)
 Operator>> Overload
```

This overload is the main way to read in data from an object such as a file to a checkpoint. It is important to note that inside the function, the first variable to be read is the size of the checkpoint. This size variable is written to the stream before the checkpoint's data in the `operator<<` overload. Be mindful of this additional read and write when you use different facilities to read in or write out data from a checkpoint!

#### Parameters

- `ist`: Input stream to write from.
- `ckp`: Checkpoint to write to.

**Return** `Operator>>` returns the `ostream` object.

---

```
template<typename T, typename ...Ts, typename U = typename std::enable_if<!hpx::traits::is_launch_policy<T>::value && !std::is_same<typename std::decay<T>, hpx::future<checkpoint>>::value>::type> hpx::future<checkpoint> save_checkpoint (T &&t, Ts&&... ts)
 Save_checkpoint
```

`Save_checkpoint` takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a `shared_ptr` to the component or by passing a component's client instance to `save_checkpoint`. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used `save_checkpoint` will simply return a checkpoint object.

#### Template Parameters

- `T`: Containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
- `Ts`: More containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
- `U`: This parameter is used to make sure that `T` is not a launch policy or a checkpoint. This forces the compiler to choose the correct overload.

#### Parameters

- `t`: A container to restore.
- `ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Return** `Save_checkpoint` returns a future to a checkpoint with one exception: if you pass `hpx::launch::sync` as the first argument. In this case `save_checkpoint` will simply return a checkpoint.

```
template<typename T, typename ...Ts>
hpx::future<checkpoint> save_checkpoint (checkpoint &&c, T &&t, Ts&&... ts)
 Save_checkpoint - Take a pre-initialized checkpoint
```

`Save_checkpoint` takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a `shared_ptr` to the component or by passing a component's client instance to `save_checkpoint`. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used `save_checkpoint` will simply return a checkpoint object.

#### Template Parameters

- `T`: Containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.
- `Ts`: More containers passed to `save_checkpoint` to be serialized and placed into a checkpoint object.

#### Parameters

- `c`: Takes a pre-initialized checkpoint to copy data into.
- `t`: A container to restore.
- `ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Return** `Save_checkpoint` returns a future to a checkpoint with one exception: if you pass `hpx::launch::sync` as the first argument. In this case `save_checkpoint` will simply return a checkpoint.

```
template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<typename std::decay<T>, hpx::future<checkpoint>>::value>::type> hpx::future<checkpoint> save_checkpoint (hpx::launch p, T &&t, Ts&&... ts)
 Save_checkpoint - Policy overload
```

Save\_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared\_ptr to the component or by passing a component's client instance to save\_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save\_checkpoint will simply return a checkpoint object.

#### Template Parameters

- T: Containers passed to save\_checkpoint to be serialized and placed into a checkpoint object.
- Ts: More containers passed to save\_checkpoint to be serialized and placed into a checkpoint object.

#### Parameters

- p: Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- t: A container to restore.
- ts: Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

**Return** Save\_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save\_checkpoint will simply return a checkpoint.

```
template<typename T, typename ...Ts>
hpx::future<checkpoint> save_checkpoint (hpx::launch p, checkpoint &&c, T &&t, Ts&&...
 ts)
Save_checkpoint - Policy overload & pre-initialized checkpoint
```

Save\_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared\_ptr to the component or by passing a component's client instance to save\_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save\_checkpoint will simply return a checkpoint object.

#### Template Parameters

- T: Containers passed to save\_checkpoint to be serialized and placed into a checkpoint object.
- Ts: More containers passed to save\_checkpoint to be serialized and placed into a checkpoint object.

#### Parameters

- p: Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- c: Takes a pre-initialized checkpoint to copy data into.
- t: A container to restore.
- ts: Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

**Return** Save\_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save\_checkpoint will simply return a checkpoint.

```
template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<typename std::decay<T>
 checkpoint save_checkpoint (hpx::launch::sync_policy sync_p, T &&t, Ts&&... ts)
Save_checkpoint - Sync_policy overload
```

Save\_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared\_ptr to the component or by passing a component's client instance to save\_checkpoint. Additionally the function

can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save\_checkpoint will simply return a checkpoint object.

#### Template Parameters

- T: Containers passed to save\_checkpoint to be serialized and placed into a checkpoint object.
- Ts: More containers passed to save\_checkpoint to be serialized and placed into a checkpoint object.
- U: This parameter is used to make sure that T is not a checkpoint. This forces the compiler to choose the correct overload.

#### Parameters

- sync\_p: hpx::launch::sync\_policy
- t: A container to restore.
- ts: Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

**Return** Save\_checkpoint which is passed hpx::launch::sync\_policy will return a checkpoint which contains the serialized values checkpoint.

```
template<typename T, typename ...Ts>
checkpoint save_checkpoint (hpx::launch::sync_policy sync_p, checkpoint &&c, T &&t,
 Ts&&... ts)
Save_checkpoint - Sync_policy overload & pre-init. checkpoint
```

Save\_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared\_ptr to the component or by passing a component's client instance to save\_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save\_checkpoint will simply return a checkpoint object.

#### Template Parameters

- T: Containers passed to save\_checkpoint to be serialized and placed into a checkpoint object.
- Ts: More containers passed to save\_checkpoint to be serialized and placed into a checkpoint object.

#### Parameters

- sync\_p: hpx::launch::sync\_policy
- c: Takes a pre-initialized checkpoint to copy data into.
- t: A container to restore.
- ts: Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

**Return** Save\_checkpoint which is passed hpx::launch::sync\_policy will return a checkpoint which contains the serialized values checkpoint.

```
template<typename T, typename ...Ts, typename U = typename std::enable_if<!hpx::traits::is_launch_policy<T>::value &&
hpx::future<checkpoint> prepare_checkpoint (T const &t, Ts const&... ts)
prepare_checkpoint
```

prepare\_checkpoint takes the containers which have to be filled from the byte stream by a subsequent restore\_checkpoint invocation. prepare\_checkpoint will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

**Return** prepare\_checkpoint returns a properly resized checkpoint object that can be used for a subsequent restore\_checkpoint operation.

#### Template Parameters

- T: A container to restore.

- `Ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Parameters**

- `t`: A container to restore.
- `ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

```
template<typename T, typename ...Ts>
hpx::future<checkpoint> prepare_checkpoint (checkpoint &&c, T const &t, Ts const&...
 ts)
 prepare_checkpoint
```

`prepare_checkpoint` takes the containers which have to be filled from the byte stream by a subsequent `restore_checkpoint` invocation. `prepare_checkpoint` will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

**Return** `prepare_checkpoint` returns a properly resized checkpoint object that can be used for a subsequent `restore_checkpoint` operation.

**Template Parameters**

- `T`: A container to restore.
- `Ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Parameters**

- `c`: Takes a pre-initialized checkpoint to prepare
- `t`: A container to restore.
- `ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

```
template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<T, checkpoint>::value>::type>
hpx::future<checkpoint> prepare_checkpoint (hpx::launch p, T const &t, Ts const&... ts)
 prepare_checkpoint
```

`prepare_checkpoint` takes the containers which have to be filled from the byte stream by a subsequent `restore_checkpoint` invocation. `prepare_checkpoint` will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

**Return** `prepare_checkpoint` returns a properly resized checkpoint object that can be used for a subsequent `restore_checkpoint` operation.

**Template Parameters**

- `T`: A container to restore.
- `Ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

**Parameters**

- `p`: Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. `async`, `sync`, etc.
- `t`: A container to restore.
- `ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

```
template<typename T, typename ...Ts>
hpx::future<checkpoint> prepare_checkpoint (hpx::launch p, checkpoint &&c, T const &t,
 Ts const&... ts)
 prepare_checkpoint
```

`prepare_checkpoint` takes the containers which have to be filled from the byte stream by a subsequent `restore_checkpoint` invocation. `prepare_checkpoint` will calculate the necessary buffer size and will

return an appropriately sized checkpoint object.

**Return** `prepare_checkpoint` returns a properly resized checkpoint object that can be used for a subsequent `restore_checkpoint` operation.

#### Template Parameters

- `T`: A container to restore.
- `Ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

#### Parameters

- `p`: Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. `async`, `sync`, etc.
- `c`: Takes a pre-initialized checkpoint to prepare
- `t`: A container to restore.
- `ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

```
template<typename T, typename ...Ts>
void restore_checkpoint (checkpoint const &c, T &t, Ts&... ts)
 Restore_checkpoint
```

`Restore_checkpoint` takes a checkpoint object as a first argument and the containers which will be filled from the byte stream (in the same order as they were placed in `save_checkpoint`). `Restore_checkpoint` can resurrect a stored component in two ways: by passing in a instance of a component's `shared_ptr` or by passing in an instance of the component's client.

**Return** `Restore_checkpoint` returns void.

#### Template Parameters

- `T`: A container to restore.
- `Ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

#### Parameters

- `c`: The checkpoint to restore.
- `t`: A container to restore.
- `ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

```
class checkpoint
#include <checkpoint.hpp> Checkpoint Object
```

`Checkpoint` is the container object which is produced by `save_checkpoint` and is consumed by a `restore_checkpoint`. A checkpoint may be moved into the `save_checkpoint` object to write the byte stream to the pre-created checkpoint object.

Checkpoints are able to store all containers which are able to be serialized including components.

## Public Types

```
using const_iterator = std::vector::const_iterator
```

## Public Functions

```

```

## Private Members

```
std::vector<char> data_
```

## Friends

```
friend hpx::util::hpx::serialization::access
std::ostream &operator<< (std::ostream &ost, checkpoint const &ckp)
 Operator<< Overload
```

This overload is the main way to write data from a checkpoint to an object such as a file. Inside the function, the size of the checkpoint will be written to the stream before the checkpoint's data. The operator>> overload uses this to read the correct number of bytes. Be mindful of this additional write and read when you use different facilities to write out or read in data to a checkpoint!

### Parameters

- `ost`: Output stream to write to.
- `ckp`: Checkpoint to copy from.

**Return** Operator`<<` returns the ostream object.

```
std::istream &operator>> (std::istream &ist, checkpoint &ckp)
 Operator>> Overload
```

This overload is the main way to read in data from an object such as a file to a checkpoint. It is important to note that inside the function, the first variable to be read is the size of the checkpoint. This size variable is written to the stream before the checkpoint's data in the operator`<<` overload. Be mindful of this additional read and write when you use different facilities to read in or write out data from a checkpoint!

#### Parameters

- `ist`: Input stream to write from.
- `ckp`: Checkpoint to write to.

**Return** Operator`>>` returns the ostream object.

```
template<typename T, typename ...Ts>
void restore_checkpoint (checkpoint const &c, T &t, Ts&... ts)
 Restore_checkpoint
```

`Restore_checkpoint` takes a checkpoint object as a first argument and the containers which will be filled from the byte stream (in the same order as they were placed in `save_checkpoint`). `Restore_checkpoint` can resurrect a stored component in two ways: by passing in a instance of a component's `shared_ptr` or by passing in an instance of the component's client.

**Return** `Restore_checkpoint` returns void.

#### Template Parameters

- `T`: A container to restore.
- `Ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

#### Parameters

- `c`: The checkpoint to restore.
- `t`: A container to restore.
- `ts`: Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

```
bool operator== (checkpoint const &lhs, checkpoint const &rhs)
```

```
bool operator!= (checkpoint const &lhs, checkpoint const &rhs)
```

## checkpoint\_base

The contents of this module can be included with the header `hpx/modules/checkpoint_base.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/checkpoint_base.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX API*.

```
namespace hpx
```

```
namespace util
```

## Functions

```
template<typename Container, typename ...Ts>
void save_checkpoint_data(Container &data, Ts&&... ts)
 save_checkpoint_data
```

Save\_checkpoint\_data takes any number of objects which a user may wish to store in the given container.

### Template Parameters

- Container: Container used to store the check-pointed data.
- Ts: Types of variables to checkpoint

### Parameters

- cont: Container instance used to store the checkpoint data
- ts: Variable instances to be inserted into the checkpoint.

```
template<typename ...Ts>
std::size_t prepare_checkpoint_data(Ts const&... ts)
 prepare_checkpoint_data
```

prepare\_checkpoint\_data takes any number of objects which a user may wish to store in a subsequent save\_checkpoint\_data operation. The function will return the number of bytes necessary to store the data that will be produced.

### Template Parameters

- Ts: Types of variables to checkpoint

### Parameters

- ts: Variable instances to be inserted into the checkpoint.

```
template<typename Container, typename ...Ts>
void restore_checkpoint_data(Container const &cont, Ts&... ts)
 restore_checkpoint_data
```

restore\_checkpoint\_data takes any number of objects which a user may wish to restore from the given container. The sequence of objects has to correspond to the sequence of objects for the corresponding call to save\_checkpoint\_data that had used the given container instance.

### Template Parameters

- Container: Container used to restore the check-pointed data.
- Ts: Types of variables to restore

### Parameters

- cont: Container instance used to restore the checkpoint data
- ts: Variable instances to be restored from the container

## collectives

The contents of this module can be included with the header `hpx/modules/collectives.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/collectives.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

**namespace hpx**

**namespace collectives**

### Functions

```
template<typename T>
hpx::future<std::vector<std::decay_t<T>>> all_gather(char const *basename, T &&result,
 num_sites_arg num_sites =
 num_sites_arg(), this_site_arg this_site =
 this_site_arg(), generation_arg generation =
 generation_arg(), root_site_arg root_site =
 root_site_arg())
```

AllGather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Return** This function returns a future holding a vector with all values send by all participating sites.  
It will become ready once the `all_gather` operation has been completed.

#### Parameters

- `basename`: The base name identifying the `all_gather` operation
- `local_result`: The value to transmit to all participating sites from this call site.
- `num_sites`: The number of participating sites (default: all localities).
- `generation`: The generational counter identifying the sequence number of the `all_gather` operation performed on the given base name. This is optional and needs to be supplied only if the `all_gather` operation on the given base name has to be performed more than once.
- `this_site`: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns. \params `root_site` The site that is responsible for creating the `all_gather` support object. This value is optional and defaults to '0' (zero).

```
template<typename T>
hpx::future<std::vector<std::decay_t<T>>> all_gather(communicator comm, T &&result,
 this_site_arg this_site =
 this_site_arg())
```

AllGather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Return** This function returns a future holding a vector with all values send by all participating sites.  
It will become ready once the `all_gather` operation has been completed.

#### Parameters

- `comm`: A communicator object returned from `create_reducer`
- `local_result`: The value to transmit to all participating sites from this call site.

- `this_site`: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

**namespace hpx**

**namespace collectives**

## Functions

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> all_reduce (char const *basename, T &&result, F &&op,
 num_sites_arg num_sites = num_sites_arg(),
 this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg(),
 root_site_arg root_site = root_site_arg())
```

AllReduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Return** This function returns a future holding a vector with all values send by all participating sites.

It will become ready once the `all_reduce` operation has been completed.

### Parameters

- `basename`: The base name identifying the `all_reduce` operation
- `local_result`: The value to transmit to all participating sites from this call site.
- `op`: Reduction operation to apply to all values supplied from all participating sites
- `num_sites`: The number of participating sites (default: all localities).
- `generation`: The generational counter identifying the sequence number of the `all_reduce` operation performed on the given base name. This is optional and needs to be supplied only if the `all_reduce` operation on the given base name has to be performed more than once.
- `this_site`: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns. \params `root_site` The site that is responsible for creating the `all_reduce` support object. This value is optional and defaults to ‘0’ (zero).

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> all_reduce (communicator comm, T &&result, F &&op,
 this_site_arg this_site = this_site_arg())
```

AllReduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Return** This function returns a future holding a vector with all values send by all participating sites.

It will become ready once the `all_reduce` operation has been completed.

### Parameters

- `comm`: A communicator object returned from `create_reducer`
- `local_result`: The value to transmit to all participating sites from this call site.
- `op`: Reduction operation to apply to all values supplied from all participating sites
- `this_site`: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

**namespace hpx**

**namespace collectives**

## Functions

```
template<typename T>
hpx::future<std::vector<std::decay_t<T>>> all_to_all(char const *basename, T &&re-
sult, num_sites_arg num_sites =
num_sites_arg(), this_site_arg this_site
= this_site_arg(), generation_arg genera-
tion = generation_arg(), root_site_arg
root_site = root_site_arg())
```

AllToAll a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Return** This function returns a future holding a vector with all values send by all participating sites.

It will become ready once the all\_to\_all operation has been completed.

### Parameters

- basename: The base name identifying the all\_to\_all operation
- local\_result: The value to transmit to all participating sites from this call site.
- num\_sites: The number of participating sites (default: all localities).
- generation: The generational counter identifying the sequence number of the all\_to\_all operation performed on the given base name. This is optional and needs to be supplied only if the all\_to\_all operation on the given base name has to be performed more than once.
- this\_site: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns. \params root\_site The site that is responsible for creating the all\_to\_all support object. This value is optional and defaults to '0' (zero).

```
template<typename T>
hpx::future<std::vector<std::decay_t<T>>> all_to_all(communicator comm, T &&re-
sult, this_site_arg this_site =
this_site_arg())
```

AllToAll a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Return** This function returns a future holding a vector with all values send by all participating sites.

It will become ready once the all\_to\_all operation has been completed.

### Parameters

- comm: A communicator object returned from *create\_reducer*
- local\_result: The value to transmit to all participating sites from this call site.
- this\_site: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

**class barrier**

#include <barrier.hpp> The barrier is an implementation performing a barrier over a number of participating threads. The different threads don't have to be on the same locality. This barrier can be invoked in a distributed application.

For a local only barrier

See `hpx::lcos::local::barrier`.

## Public Functions

**barrier** (*std::string const &base\_name*)

Creates a barrier, rank is locality id, size is number of localities

A barrier *base\_name* is created. It expects that `hpx::get_num_localities()` participate and the local rank is `hpx::get_locality_id()`.

**Parameters**

- *base\_name*: The name of the barrier

**barrier** (*std::string const &base\_name, std::size\_t num*)

Creates a barrier with a given size, rank is locality id

A barrier *base\_name* is created. It expects that *num* participate and the local rank is `hpx::get_locality_id()`.

**Parameters**

- *base\_name*: The name of the barrier
- *num*: The number of participating threads

**barrier** (*std::string const &base\_name, std::size\_t num, std::size\_t rank*)

Creates a barrier with a given size and rank

A barrier *base\_name* is created. It expects that *num* participate and the local rank is *rank*.

**Parameters**

- *base\_name*: The name of the barrier
- *num*: The number of participating threads
- *rank*: The rank of the calling site for this invocation

**barrier** (*std::string const &base\_name, std::vector<std::size\_t> const &ranks, std::size\_t rank*)

Creates a barrier with a vector of ranks

A barrier *base\_name* is created. It expects that *ranks.size()* and the local rank is *rank* (must be contained in *ranks*).

**Parameters**

- *base\_name*: The name of the barrier
- *ranks*: Gives a list of participating ranks (this could be derived from a list of locality ids)
- *rank*: The rank of the calling site for this invocation

void **wait** ()

Wait until each participant entered the barrier. Must be called by all participants

**Return** This function returns once all participants have entered the barrier (have called *wait*).

*hpx::future<void>* **wait** (*hpx::launch::async\_policy*)

Wait until each participant entered the barrier. Must be called by all participants

**Return** a future that becomes ready once all participants have entered the barrier (have called *wait*).

## Public Static Functions

**static void synchronize()**

Perform a global synchronization using the default global barrier. The barrier is created once at startup and can be reused throughout the lifetime of an HPX application.

**Note** This function currently does not support dynamic connection and disconnection of localities.

**namespace hpx**

**namespace collectives**

### Functions

```
template<typename T>
hpx::future<void> broadcast_to(char const *basename, T &&local_result, num_sites_arg
 num_sites = num_sites_arg(), this_site_arg this_site =
 this_site_arg(), generation_arg generation = genera-
 tion_arg())
```

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

**Return** This function returns a future that will become ready once the broadcast operation has been completed.

#### Parameters

- **basename**: The base name identifying the broadcast operation
- **local\_result**: A value to transmit to all participating sites from this call site.
- **num\_sites**: The number of participating sites (default: all localities).
- **generation**: The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once.
- **this\_site**: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

```
template<typename T>
hpx::future<void> broadcast_to(communicator comm, T &&local_result, this_site_arg
 this_site = this_site_arg())
```

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

**Return** This function returns a future that will become ready once the broadcast operation has been completed.

#### Parameters

- **comm**: A communicator object returned from *create\_reducer*
- **local\_result**: A value to transmit to all participating sites from this call site.
- **this\_site**: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

template<typename T>

```
hpx::future<T> broadcast_from(char const *basename, this_site_arg this_site =
 this_site_arg(), generation_arg generation = genera-
 tion_arg())
```

Receive a value that was broadcast to different call sites

This function sends a set of values to all call sites operating on the given base name.

**Return** This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

#### Parameters

- basename: The base name identifying the broadcast operation
- generation: The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once.
- this\_site: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

```
template<typename T>
hpx::future<T> broadcast_from(communicator comm, this_site_arg this_site = this_site_arg())
```

Receive a value that was broadcast to different call sites

This function sends a set of values to all call sites operating on the given base name.

**Return** This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

#### Parameters

- comm: A communicator object returned from *create\_reducer*
- this\_site: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

**namespace hpx**

**namespace lcos**

### Functions

```
template<typename Action, typename ArgN, ...> hpx::future<std::vector<decltype(Action)>>
```

Perform a distributed broadcast operation.

The function hpx::lcos::broadcast performs a distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

**Return** This function returns a future representing the result of the overall reduction operation.

**Note** If decltype(Action(...)) is void, then the result of this function is future<void>.

#### Parameters

- ids: [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- argN: [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

---

```
template<typename Action, typename ArgN, ...>void hpx::lcos::broadcast_apply(std::vector<Action>, std::vector<ArgN>)
```

Perform an asynchronous (fire&forget) distributed broadcast operation.

The function `hpx::lcos::broadcast_apply` performs an asynchronous (fire&forget) distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The given action is invoked asynchronously on all given identifiers, and the arguments `ArgN` are passed along to those invocations.

#### Parameters

- `ids`: [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `argN`: [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

```
template<typename Action, typename ArgN, ...>hpx::future< std::vector<decltype(Action)>> hpx::lcos::broadcast_with_index(std::vector<Action>, std::vector<ArgN>, size_t index)
```

Perform a distributed broadcast operation.

The function `hpx::lcos::broadcast_with_index` performs a distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The given action is invoked asynchronously on all given identifiers, and the arguments `ArgN` are passed along to those invocations.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

**Return** This function returns a future representing the result of the overall reduction operation.

**Note** If `decltype(Action(...))` is void, then the result of this function is `future<void>`.

#### Parameters

- `ids`: [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `argN`: [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

```
template<typename Action, typename ArgN, ...>void hpx::lcos::broadcast_apply_with_index(std::vector<Action>, std::vector<ArgN>, size_t index)
```

Perform an asynchronous (fire&forget) distributed broadcast operation.

The function `hpx::lcos::broadcast_apply_with_index` performs an asynchronous (fire&forget) distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The given action is invoked asynchronously on all given identifiers, and the arguments `ArgN` are passed along to those invocations.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

#### Parameters

- `ids`: [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `argN`: [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

```
namespace hpx
```

```
namespace collectives
```

## Functions

```
hpx::future<channel_communicator> create_channel_communicator (char const
 *basename,
 num_sites_arg
 num_sites =
 num_sites_arg(),
 this_site_arg
 this_site =
 this_site_arg())
```

Create a new communicator object usable with peer-to-peer channel-based operations

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of channel-based peer-to-peer operations.

**Return** This function returns a future to a new communicator object usable with the collective operation.

### Parameters

- `basename`: The base name identifying the collective operation
- `num_sites`: The number of participating sites (default: all localities).
- `this_site`: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

```
channel_communicator create_channel_communicator (hpx::launch::sync_policy,
 char const *basename,
 num_sites_arg num_sites =
 num_sites_arg(), this_site_arg
 this_site = this_site_arg())
```

Create a new communicator object usable with peer-to-peer channel-based operations

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of channel-based peer-to-peer operations.

**Return** This function returns a new communicator object usable with the collective operation.

### Parameters

- `basename`: The base name identifying the collective operation
- `num_sites`: The number of participating sites (default: all localities).
- `this_site`: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

```
template<typename T>
hpx::future<void> set (channel_communicator comm, that_site_arg site, T &&value, tag_arg tag = 0)
```

Send a value to the given site

This function sends a value to the given site based on the given communicator.

**Return** This function returns a future<void> that becomes ready once the data transfer operation has finished.

#### Parameters

- `comm`: The channel communicator object to use for the data transfer
- `site`: The destination site
- `value`: The value to send
- `tag`: The (optional) tag identifying the concrete operation

```
template<typename T>
hpx::future<T> get (channel_communicator comm, that_site_arg site, tag_arg tag = 0)
Send a value to the given site
```

This function receives a value from the given site based on the given communicator.

**Return** This function returns a future<T> that becomes ready once the data transfer operation has finished. The future will hold the received value.

#### Parameters

- `comm`: The channel communicator object to use for the data transfer
- `site`: The source site

**namespace hpx**

**namespace lcos**

## Functions

```
hpx::future<hpx::id_type> create_communication_set (char const *basename, std::size_t
 num_sites = std::size_t(-1),
 std::size_t this_site = std::size_t(-1),
 std::size_t arity = std::size_t(-1))
```

The function *create\_communication\_set* sets up a (distributed) tree-like communication structure that can be used with any of the collective APIs (such like *all\_to\_all* and similar).

**Return** This function returns a future holding an id\_type of the communicator object to be used on the current locality.

#### Parameters

- `basename`: The base name identifying the all\_to\_all operation
- `num_sites`: The number of participating sites (default: all localities).
- `this_site`: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- `arity`: The number of children each of the communication nodes is connected to (default: picked based on num\_sites)

**namespace hpx**

**namespace collectives**

## Functions

```
communicator create_communicator(char const *basename, num_sites_arg num_sites
= num_sites_arg(), this_site_arg this_site =
this_site_arg(), generation_arg generation = generation_arg(),
root_site_arg root_site = root_site_arg())
```

Create a new communicator object usable with any collective operation

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of any of the collective operations (such as *all\_gather*, *all\_reduce*, *all\_to\_all*, *broadcast*, etc.).

**Return** This function returns a new communicator object usable with the collective operation.

### Parameters

- *basename*: The base name identifying the collective operation
- *num\_sites*: The number of participating sites (default: all localities).
- *generation*: The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
- *this\_site*: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns. \params *root\_site* The site that is responsible for creating the collective support object. This value is optional and defaults to '0' (zero).

**namespace hpx**

**namespace collectives**

## Functions

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> exclusive_scan(char const *basename, T &&result, F &&op,
num_sites_arg num_sites = num_sites_arg(),
this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg(),
root_site_arg root_site = root_site_arg())
```

Exclusive scan a set of values from different call sites

This function performs an exclusive scan operation on a set of values received from all call sites operating on the given base name.

**Note** The result returned on the *root\_site* is always the same as the result returned on *this\_site == 1* and is the same as the value provided by the the *root\_site*.

**Return** This function returns a future holding a vector with all values send by all participating sites. It will become ready once the *exclusive\_scan* operation has been completed.

### Parameters

- *basename*: The base name identifying the *exclusive\_scan* operation
- *local\_result*: The value to transmit to all participating sites from this call site.
- *op*: Reduction operation to apply to all values supplied from all participating sites
- *num\_sites*: The number of participating sites (default: all localities).
- *generation*: The generational counter identifying the sequence number of the *exclusive\_scan* operation performed on the given base name. This is optional and needs to be sup-

plied only if the exclusive\_scan operation on the given base name has to be performed more than once.

- **this\_site**: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns. \params root\_site The site that is responsible for creating the exclusive\_scan support object. This value is optional and defaults to '0' (zero).

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> exclusive_scan (communicator comm, T &&result, F &&op,
 this_site_arg this_site = this_site_arg())
```

Exclusive scan a set of values from different call sites

This function performs an exclusive scan operation on a set of values received from all call sites operating on the given base name.

**Note** The result returned on the root\_site is always the same as the result returned on thus\_site == 1 and is the same as the value provided by the thje root\_site.

**Return** This function returns a future holding a vector with all values send by all participating sites. It will become ready once the exclusive\_scan operation has been completed.

#### Parameters

- *comm*: A communicator object returned from *create\_reducer*
- *local\_result*: The value to transmit to all participating sites from this call site.
- *op*: Reduction operation to apply to all values supplied from all participating sites
- *this\_site*: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

```
namespace hpx
```

```
namespace lcos
```

## Functions

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...>hpx::future<
```

Perform a distributed fold operation.

The function hpx::lcos::fold performs a distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

**Note** The type of the initial value must be convertible to the result type returned from the invoked action.

**Return** This function returns a future representing the result of the overall folding operation.

#### Parameters

- *ids*: [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- *fold\_op*: [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
- *init*: [in] The initial value to be used for the folding operation
- *argN*: [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...>hpx::f
```

Perform a distributed folding operation.

The function `hpx::lcos::fold_with_index` performs a distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

**Note** The type of the initial value must be convertible to the result type returned from the invoked action.

**Return** This function returns a future representing the result of the overall folding operation.

**Parameters**

- `ids`: [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `fold_op`: [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
- `init`: [in] The initial value to be used for the folding operation
- `argN`: [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...>hpx::f
```

Perform a distributed inverse folding operation.

The function `hpx::lcos::inverse_fold` performs an inverse distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

**Note** The type of the initial value must be convertible to the result type returned from the invoked action.

**Return** This function returns a future representing the result of the overall folding operation.

**Parameters**

- `ids`: [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `fold_op`: [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
- `init`: [in] The initial value to be used for the folding operation
- `argN`: [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...>hpx::f
```

Perform a distributed inverse folding operation.

The function `hpx::lcos::inverse_fold_with_index` performs an inverse distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

**Note** The type of the initial value must be convertible to the result type returned from the invoked action.

**Return** This function returns a future representing the result of the overall folding operation.

#### Parameters

- `ids`: [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `fold_op`: [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
- `init`: [in] The initial value to be used for the folding operation
- `argN`: [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

```
namespace hpx
```

```
namespace collectives
```

### Functions

```
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_here(char const *basename, T &&result,
 num_sites_arg num_sites =
 num_sites_arg(), this_site_arg this_site =
 this_site_arg(), generation_arg generation =
 generation_arg())
```

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Return** This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

#### Parameters

- `basename`: The base name identifying the gather operation
- `result`: The value to transmit to the central gather point from this call site.
- `num_sites`: The number of participating sites (default: all localities).
- `generation`: The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once.
- `this_site`: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

```
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_here(communicator comm, T &&result,
 this_site_arg this_site = this_site_arg())
```

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Return** This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

#### Parameters

- `comm`: A communicator object returned from `create_reducer`

- **result**: The value to transmit to the central gather point from this call site.
- **this\_site**: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

```
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_there(char const *basename, T &&result,
 this_site_arg this_site = this_site_arg(),
 generation_arg generation = generation_arg(),
 root_site_arg root_site =
 root_site_arg())
```

Gather a given value at the given call site

This function transmits the value given by *result* to a central gather site (where the corresponding *gather\_here* is executed)

**Return** This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

#### Parameters

- **basename**: The base name identifying the gather operation
- **result**: The value to transmit to the central gather point from this call site.
- **generation**: The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once.
- **this\_site**: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.
- **root\_site**: The sequence number of the central gather point (usually the locality id). This value is optional and defaults to 0.

```
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_there(communicator comm, T &&result,
 this_site_arg this_site = this_site_arg())
```

Gather a given value at the given call site

This function transmits the value given by *result* to a central gather site (where the corresponding *gather\_here* is executed)

**Return** This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

#### Parameters

- **comm**: A communicator object returned from *create\_reducer*
- **result**: The value to transmit to the central gather point from this call site.
- **this\_site**: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

```
namespace hpx
```

```
namespace collectives
```

## Functions

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> inclusive_scan (char const *basename, T &&result, F &&op,
 num_sites_arg num_sites = num_sites_arg(),
 this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg(),
 root_site_arg root_site = root_site_arg())
```

Inclusive inclusive\_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

**Return** This function returns a future holding a vector with all values send by all participating sites.

It will become ready once the inclusive\_scan operation has been completed.

### Parameters

- basename: The base name identifying the inclusive\_scan operation
- local\_result: The value to transmit to all participating sites from this call site.
- op: Reduction operation to apply to all values supplied from all participating sites
- num\_sites: The number of participating sites (default: all localities).
- generation: The generational counter identifying the sequence number of the inclusive\_scan operation performed on the given base name. This is optional and needs to be supplied only if the inclusive\_scan operation on the given base name has to be performed more than once.
- this\_site: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns. \params root\_site The site that is responsible for creating the inclusive\_scan support object. This value is optional and defaults to '0' (zero).

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> inclusive_scan (communicator comm, T &&result, F &&op,
 this_site_arg this_site = this_site_arg())
```

Inclusive inclusive\_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

**Return** This function returns a future holding a vector with all values send by all participating sites.

It will become ready once the inclusive\_scan operation has been completed.

### Parameters

- comm: A communicator object returned from *create\_reducer*
- local\_result: The value to transmit to all participating sites from this call site.
- op: Reduction operation to apply to all values supplied from all participating sites
- this\_site: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

**namespace hpx**

**namespace lcos**

```
class latch : public components::client_base<latch, lcos::server::latch>
```

## Public Functions

**latch()**

**latch(std::ptrdiff\_t count)**

Initialize the latch

Requires: count >= 0. Synchronization: None Postconditions: counter\_ == count.

**latch(naming::id\_type const &id)**

Extension: Create a client side representation for the existing *server::latch* instance with the given global id *id*.

**latch(hpx::future<naming::id\_type> &&f)**

Extension: Create a client side representation for the existing *server::latch* instance with the given global id *id*.

**latch(hpx::shared\_future<naming::id\_type> const &id)**

Extension: Create a client side representation for the existing *server::latch* instance with the given global id *id*.

**latch(hpx::shared\_future<naming::id\_type> &&id)**

void **count\_down\_and\_wait()**

Decrements counter\_ by 1 . Blocks at the synchronization point until counter\_ reaches 0.

Requires: counter\_ > 0.

Synchronization: Synchronizes with all calls that block on this latch and with all is\_ready calls on this latch that return true.

### Exceptions

- Nothing.:

void **count\_down(std::ptrdiff\_t n)**

Decrements counter\_ by n. Does not block.

Requires: counter\_ >= n and n >= 0.

Synchronization: Synchronizes with all calls that block on this latch and with all is\_ready calls on this latch that return true .

### Exceptions

- Nothing.:

bool **is\_ready() const**

Returns: counter\_ == 0. Does not block.

### Exceptions

- Nothing.:

void **wait() const**

If counter\_ is 0, returns immediately. Otherwise, blocks the calling thread at the synchronization point until counter\_ reaches 0.

### Exceptions

- Nothing.:

## Private Types

```
typedef components::client_base<latch, lcos::server::latch> base_type
namespace hpx

namespace collectives
```

## Functions

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> reduce_here (char const *basename, T &&result, F &&op,
 num_sites_arg num_sites = num_sites_arg(),
 this_site_arg this_site = this_site_arg(), generation_arg generation = generation_arg())
```

Reduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

**Return** This function returns a future holding a vector with all values send by all participating sites.  
It will become ready once the all\_reduce operation has been completed.

### Parameters

- basename: The base name identifying the all\_reduce operation
- local\_result: A value to reduce on the central reduction point from this call site.
- op: Reduction operation to apply to all values supplied from all participating sites
- num\_sites: The number of participating sites (default: all localities).
- generation: The generational counter identifying the sequence number of the all\_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all\_reduce operation on the given base name has to be performed more than once.
- this\_site: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

```
template<typename T, typename F>
hpx::future<decay_t<T>> reduce_here (communicator comm, T &&local_result, F &&op,
 this_site_arg this_site = this_site_arg())
```

Reduce a set of values from different call sites

This function receives a set of values that are the result of applying a given operator on values supplied from all call sites operating on the given base name.

**Return** This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all\_reduce operation has been completed.

### Parameters

- comm: A communicator object returned from *create\_communicator*
- local\_result: A value to reduce on the root\_site from this call site.
- op: Reduction operation to apply to all values supplied from all participating sites
- this\_site: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

```
template<typename T, typename F>
hpx::future<void> reduce_there (char const *basename, T &&result, this_site_arg this_site =
 this_site_arg(), generation_arg generation = generation_arg(),
 root_site_arg root_site = root_site_arg())
```

Reduce a given value at the given call site

This function transmits the value given by *result* to a central reduce site (where the corresponding *reduce\_here* is executed)

**Return** This function returns a future<void>. It will become ready once the reduction operation has been completed.

#### Parameters

- *basename*: The base name identifying the reduction operation
- *result*: A future referring to the value to transmit to the central reduction point from this call site.
- *generation*: The generational counter identifying the sequence number of the reduction operation performed on the given base name. This is optional and needs to be supplied only if the reduction operation on the given base name has to be performed more than once.
- *this\_site*: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.
- *root\_site*: The sequence number of the central reduction point (usually the locality id). This value is optional and defaults to 0.

```
template<typename T>
hpx::future<void> reduce_there(communicator comm, T &&local_result, this_site_arg
this_site = this_site_arg())
```

Reduce a given value at the given call site

This function transmits the value given by *result* to a central reduce site (where the corresponding *reduce\_here* is executed)

**Return** This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all\_reduce operation has been completed.

#### Parameters

- *comm*: A communicator object returned from *create\_communicator*
- *local\_result*: A value to reduce on the central reduction point from this call site.
- *this\_site*: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

```
namespace hpx
```

```
namespace lcos
```

## Functions

```
template<typename Action, typename ReduceOp, typename ArgN, ...>hpx::future<decaytyp
Perform a distributed reduction operation.
```

The function hpx::lcos::reduce performs a distributed reduction operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

**Return** This function returns a future representing the result of the overall reduction operation.

#### Parameters

- *ids*: [in] A list of global identifiers identifying the target objects for which the given action will be invoked.

- `reduce_op`: [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the reduction operation performed on its arguments.
- `argN`: [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

```
template<typename Action, typename ReduceOp, typename ArgN, ...> hpx::future<decaytype
```

Perform a distributed reduction operation.

The function `hpx::lcos::reduce_with_index` performs a distributed reduction operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

**Return** This function returns a future representing the result of the overall reduction operation.

#### Parameters

- `ids`: [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- `reduce_op`: [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the reduction operation performed on its arguments.
- `argN`: [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

```
namespace hpx
```

```
namespace collectives
```

## Functions

```
template<typename T>
hpx::future<T> scatter_from(char const *basename, this_site_arg this_site = this_site_arg(),
 generation_arg generation = generation_arg(), root_site_arg
 root_site = root_site_arg())
```

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

**Return** This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

#### Parameters

- `basename`: The base name identifying the scatter operation
- `generation`: The generational counter identifying the sequence number of the scatter operation performed on the given base name. This is optional and needs to be supplied only if the scatter operation on the given base name has to be performed more than once.
- `this_site`: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- `root_site`: The sequence number of the central scatter point (usually the locality id). This value is optional and defaults to 0.

```
template<typename T>
```

```
hpx::future<T> scatter_from (communicator comm, this_site_arg this_site = this_site_arg())
```

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

**Return** This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

**Parameters**

- *comm*: A communicator object returned from *create\_reducer*
- *this\_site*: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

```
template<typename T>
```

```
hpx::future<T> scatter_to (char const *basename, std::vector<T> &&result, num_sites_arg
 num_sites = num_sites_arg(), this_site_arg this_site =
 this_site_arg(), generation_arg generation = generation_arg())
```

Scatter (send) a part of the value set at the given call site

This function transmits the value given by *result* to a central scatter site (where the corresponding *scatter\_from* is executed)

**Return** This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

**Parameters**

- *basename*: The base name identifying the scatter operation
- *result*: The value to transmit to the central scatter point from this call site.
- *num\_sites*: The number of participating sites (default: all localities).
- *generation*: The generational counter identifying the sequence number of the scatter operation performed on the given base name. This is optional and needs to be supplied only if the scatter operation on the given base name has to be performed more than once.
- *this\_site*: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

```
template<typename T>
```

```
hpx::future<T> scatter_to (communicator comm, std::vector<T> &&result, this_site_arg
 this_site = this_site_arg())
```

Scatter (send) a part of the value set at the given call site

This function transmits the value given by *result* to a central scatter site (where the corresponding *scatter\_from* is executed)

**Return** This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

**Parameters**

- *comm*: A communicator object returned from *create\_reducer*
- *num\_sites*: The number of participating sites (default: all localities).
- *this\_site*: The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get\_locality\_id() returns.

**namespace hpx**

**namespace lcos**

## Functions

```
template<typename F, typename ...Args>
hpx::future<void> define_spmd_block(std::string &&name, std::size_t images_per_locality,
 F&&, Args&&... args)

struct spmd_block
 #include <spmd_block.hpp> The class spmd_block defines an interface for launching multiple images
 while giving handles to each image to interact with the remaining images. The define_spmd_block
 function templates create multiple images of a user-defined action and launches them in a possibly
 separate thread. A temporary spmd block object is created and diffused to each image. The constraint
 for the action given to the define_spmd_block function is to accept a spmd_block as first parameter.
```

### Public Functions

**namespace hpx**

## Functions

```
template<typename Client>
std::vector<Client> find_all_from_basename (std::string base_name, std::size_t num_ids)
 Return all registered clients from all localities from the given base name.
```

This function locates all ids which were registered with the given base name. It returns a list of futures representing those ids.

Return all registered ids from all localities from the given base name.

**Return** A list of futures representing the ids which were registered using the given base name.

**Note** The futures embedded in the returned client objects will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

### Template Parameters

- Client: The client type to return

### Parameters

- base\_name: [in] The base name for which to retrieve the registered ids.
- num\_ids: [in] The number of registered ids to expect.

This function locates all ids which were registered with the given base name. It returns a list of futures representing those ids.

**Return** A list of futures representing the ids which were registered using the given base name.

**Note** The futures will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

#### Parameters

- `base_name`: [in] The base name for which to retrieve the registered ids.
- `num_ids`: [in] The number of registered ids to expect.

```
template<typename Client>
std::vector<Client> find_from_basename (std::string base_name, std::vector<std::size_t> const
&ids)
```

Return registered clients from the given base name and sequence numbers.

This function locates the ids which were registered with the given base name and the given sequence numbers. It returns a list of futures representing those ids.

Return registered ids from the given base name and sequence numbers.

**Return** A list of futures representing the ids which were registered using the given base name and sequence numbers.

**Note** The futures embedded in the returned client objects will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

#### Template Parameters

- `Client`: The client type to return

#### Parameters

- `base_name`: [in] The base name for which to retrieve the registered ids.
- `ids`: [in] The sequence numbers of the registered ids.

This function locates the ids which were registered with the given base name and the given sequence numbers. It returns a list of futures representing those ids.

**Return** A list of futures representing the ids which were registered using the given base name and sequence numbers.

**Note** The futures will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

#### Parameters

- `base_name`: [in] The base name for which to retrieve the registered ids.
- `ids`: [in] The sequence numbers of the registered ids.

```
template<typename Client>
```

**Client** **find\_from\_basename** (*std::string base\_name, std::size\_t sequence\_nr*)

Return registered id from the given base name and sequence number.

This function locates the id which was registered with the given base name and the given sequence number. It returns a future representing those id.

This function locates the id which was registered with the given base name and the given sequence number. It returns a future representing those id.

**Return** A representing the id which was registered using the given base name and sequence numbers.

**Note** The future embedded in the returned client object will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

### Template Parameters

- Client: The client type to return

### Parameters

- base\_name: [in] The base name for which to retrieve the registered ids.
- sequence\_nr: [in] The sequence number of the registered id.

**Return** A representing the id which was registered using the given base name and sequence numbers.

**Note** The future will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

### Parameters

- base\_name: [in] The base name for which to retrieve the registered ids.
- sequence\_nr: [in] The sequence number of the registered id.

```
template<typename Client, typename Stub>
hpx::future<bool> register_with_basename (std::string base_name,
 components::client_base<Client, Stub> &client, std::size_t
 sequence_nr)
```

Register the id wrapped in the given client using the given base name.

The function registers the object the given client refers to using the provided base name.

**Return** A future representing the result of the registration operation itself.

**Note** The operation will fail if the given sequence number is not unique.

### Template Parameters

- Client: The client type to register

### Parameters

- base\_name: [in] The base name for which to retrieve the registered ids.
- client: [in] The client which should be registered using the given base name.

- `sequence_nr`: [in, optional] The sequential number to use for the registration of the id. This number has to be unique system wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

```
template<typename Client>
Client unregister_with_basename(std::string base_name, std::size_t sequence_nr)
```

Unregister the given id using the given base name.

Unregister the given base name.

The function unregisters the given ids using the provided base name.

The function unregisters the given ids using the provided base name.

**Return** A future representing the result of the un-registration operation itself.

#### Template Parameters

- `Client`: The client type to return

#### Parameters

- `base_name`: [in] The base name for which to retrieve the registered ids.
- `sequence_nr`: [in, optional] The sequential number to use for the un-registration. This number has to be the same as has been used with `register_with_basename` before.

**Return** A future representing the result of the un-registration operation itself.

#### Parameters

- `base_name`: [in] The base name for which to retrieve the registered ids.
- `sequence_nr`: [in, optional] The sequential number to use for the un-registration. This number has to be the same as has been used with `register_with_basename` before.

```
namespace hpx
```

#### Functions

```
hpx::future<bool> register_with_basename(std::string base_name, hpx::id_type id, std::size_t
sequence_nr = ~static_cast<std::size_t>(0))
```

Register the given id using the given base name.

The function registers the given ids using the provided base name.

**Return** A future representing the result of the registration operation itself.

**Note** The operation will fail if the given sequence number is not unique.

#### Parameters

- `base_name`: [in] The base name for which to retrieve the registered ids.
- `id`: [in] The id to register using the given base name.

- `sequence_nr`: [in, optional] The sequential number to use for the registration of the id. This number has to be unique system wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

```
hpx::future<bool> register_with_basename (std::string base_name, hpx::future<hpx::id_type>
 f, std::size_t sequence_nr = ~static_cast<std::size_t>(0))
```

Register the id wrapped in the given future using the given base name.

The function registers the object the given future refers to using the provided base name.

**Return** A future representing the result of the registration operation itself.

**Note** The operation will fail if the given sequence number is not unique.

#### Parameters

- `base_name`: [in] The base name for which to retrieve the registered ids.
- `f`: [in] The future which should be registered using the given base name.
- `sequence_nr`: [in, optional] The sequential number to use for the registration of the id. This number has to be unique system wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

template<typename Executor_ = Executor>
static void schedule_thread(hpx::naming::address::address_type
 lva, naming::address::component_type,
 hpx::threads::thread_init_data &data,
 hpx::threads::thread_schedule_state)
This is the default hook implementation for schedule_thread which forwards to the executor instance associated with this component.
```

## Protected Attributes

```
executor_type exec_
```

## Private Types

```
typedef BaseComponent base_type
typedef Executor executor_type
typedef base_type::this_component_type this_component_type
namespace hpx
```

## Functions

```
template<typename Component>
hpx::future<std::shared_ptr<Component>> get_ptr(naming::id_type const &id)
```

Returns a future referring to the pointer to the underlying memory of a component.

The function hpx::get\_ptr can be used to extract a future referring to the pointer to the underlying memory of a given component.

**Return** This function returns a future representing the pointer to the underlying memory for the component instance with the given *id*.

**Note** This function will successfully return the requested result only if the given component is currently located on the calling locality. Otherwise the function will raise an error.

**Note** The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared\_ptr alive.

### Parameters

- *id*: [in] The global id of the component for which the pointer to the underlying memory should be retrieved.

### Template Parameters

- The: only template parameter has to be the type of the server side component.

```
template<typename Derived, typename Stub>
hpx::future<std::shared_ptr<typename components::client_base<Derived, Stub>::server_component_type>> get_ptr(compo
Stu
cons
&c)
```

Returns a future referring to the pointer to the underlying memory of a component.

The function hpx::get\_ptr can be used to extract a future referring to the pointer to the underlying memory of a given component.

**Return** This function returns a future representing the pointer to the underlying memory for the component instance with the given *id*.

**Note** This function will successfully return the requested result only if the given component is currently located on the calling locality. Otherwise the function will raise an error.

**Note** The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared\_ptr alive.

### Parameters

- *c*: [in] A client side representation of the component for which the pointer to the underlying memory should be retrieved.

```
template<typename Component>
std::shared_ptr<Component> get_ptr(launch::sync_policy p, naming::id_type const &id, er-
ror_code &ec = throws)
```

Returns the pointer to the underlying memory of a component.

The function hpx::get\_ptr\_sync can be used to extract the pointer to the underlying memory of a given component.

**Return** This function returns the pointer to the underlying memory for the component instance with the given *id*.

**Note** This function will successfully return the requested result only if the given component is currently located on the requesting locality. Otherwise the function will raise and error.

**Note** The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared\_ptr alive.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *p*: [in] The parameter *p* represents a placeholder type to turn make the call synchronous.
- *id*: [in] The global id of the component for which the pointer to the underlying memory should be retrieved.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Template Parameters

- *The*: only template parameter has to be the type of the server side component.

```
template<typename Derived, typename Stub>
std::shared_ptr<typename components::client_base<Derived, Stub>::server_component_type> get_ptr(launch::sync_policy
p,
com-
po-
nents::client_base<
Stub>
const
&c,
er-
ror_code
&ec
=
throws)
```

Returns the pointer to the underlying memory of a component.

The function *hpx::get\_ptr\_sync* can be used to extract the pointer to the underlying memory of a given component.

**Return** This function returns the pointer to the underlying memory for the component instance with the given *id*.

**Note** This function will successfully return the requested result only if the given component is currently located on the requesting locality. Otherwise the function will raise and error.

**Note** The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared\_ptr alive.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *p*: [in] The parameter *p* represents a placeholder type to turn make the call synchronous.

- `c`: [in] A client side representation of the component for which the pointer to the underlying memory should be retrieved.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
namespace hpx
```

```
namespace components
```

## components\_base

The contents of this module can be included with the header `hpx/modules/components_base.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/components_base.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX API*.

```
namespace hpx
```

```
namespace agas
```

```

```
namespace components
```

```
template<bool(*)(startup_function_type &, bool &) Startup, bool(*)(shutdown_function_type &, bool &) Shutdown>
#include <component_startup_shutdown.hpp>
```

The component\_startup\_shutdown class provides a minimal implementation of a component's startup/shutdown function provider.

## Public Functions

`bool get_startup_function (startup_function_type &startup, bool &pre_startup)`

Return any startup function for this component.

**Return** Returns *true* if the parameter *startup* has been successfully initialized with the startup function.

**Parameters**

- *startup*: [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.

`bool get_shutdown_function (shutdown_function_type &shutdown, bool &pre_shutdown)`

Return any shutdown function for this component.

**Return** Returns *true* if the parameter *shutdown* has been successfully initialized with the shutdown function.

**Parameters**

- *shutdown*: [in, out] The module is expected to fill this function object with a reference to a shutdown function. This function will be executed by the runtime system during system shutdown.

```

typedef component_base<Component> instead
template<typename Component>
using abstract_simple_component_base = abstract_component_base<Component>

template<typename Component, typename Derived>
class managed_component
 #include <managed_component_base.hpp> The managed_component template is used as a indirection layer for components allowing to gracefully handle the access to non-existing components.

```

Additionally it provides memory management capabilities for the wrapping instances, and it integrates the memory management with the AGAS service. Every instance of a *managed\_component* gets assigned a global id. The provided memory management allocates the *managed\_component* instances from a special heap, ensuring fast allocation and avoids a full network round trip to the AGAS service for each of the allocated instances.

**Template Parameters**

- Component:
- Derived:

```
namespace hpx
```

```
namespace util
```

```
class unique_id_ranges
```

```
#include <generate_unique_ids.hpp> The unique_id_ranges class is a type responsible for generating unique ids for components, parcels, threads etc.
```

**Public Functions**

```
unique_id_ranges()
```

```
naming::gid_type get_id(std::size_t count = 1)
```

Generate next unique component id.

```
void set_range(naming::gid_type const &lower, naming::gid_type const &upper)
```

**Private Types**

```
enum [anonymous]
```

size of the id range returned by command\_getidrange FIXME: is this a policy?

Values:

```
range_delta = 0x100000
```

```
typedef hpx::util::spinlock mutex_type
```

**Private Members**

```
mutex_type mtx_
```

```
naming::gid_type lower_
```

The range of available ids for components.

```
naming::gid_type upper_
```

```
template<typename Component>
```

```
struct get_lva<Component, typename std::enable_if<!traits::is_managed_component<Component>::value>::type>
```

## Public Static Functions

```

template<typename Component>
struct get_lva<Component, typename std::enable_if<traits::is_managed_component<Component>::value && !std::is_const<
```

## Public Static Functions

```
static Component *call (naming::address_type lva)
template<typename Component>
struct get_lva<Component, typename std::enable_if<traits::is_managed_component<Component>::value && std::is_const<
```

## Public Static Functions

```
static Component *call (naming::address_type lva)
namespace hpx
```

```
template<typename Component, typename Enable = void>
struct get_lva
```

#include <get\_lva.hpp> The get\_lva template is a helper structure allowing to convert a local virtual address as stored in a local address (returned from the function *resolver\_client::resolve*) to the address of the component implementing the action.

The default implementation uses the template argument *Component* to deduce the type wrapping the component implementing the action. This is used to get the needed address.

## Template Parameters

- Component: This is the type of the component implementing the action to execute.

```
template<typename Component>
struct get_lva<Component, typename std::enable_if<!traits::is_managed_component<Component>::value>::type>
```

## Public Static Functions

## compute

The contents of this module can be included with the header `hpx/modules/compute.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/compute.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```
namespace hpx
```

```
namespace compute
```

## Functions

```
template<typename T, typename Allocator>
void swap(vector<T, Allocator> &x, vector<T, Allocator> &y)
 Effects: x.swap(y);

template<typename T, typename Allocator = std::allocator<T>>
class vector
```

## Public Types

```
template<>
using value_type = T
 Member types (FIXME: add reference to std.

template<>
using allocator_type = Allocator

template<>
using access_target = typename alloc_traits::access_target

template<>
using reverse_iterator = detail::reverse_iterator<T, Allocator>

template<>
using const_reverse_iterator = detail::const_reverse_iterator<T, Allocator>
```

## Public Functions

```
vector (Allocator const &alloc = Allocator())
vector (size_type count, T const &value, Allocator const &alloc = Allocator())
vector (size_type count, Allocator const &alloc = Allocator())

template<typename InIter, typename Enable = typename std::enable_if<hpx::traits::is_input_iterator<InIter>::value >
vector (InIter first, InIter last, Allocator const &alloc)

vector (vector const &other)
vector (vector const &other, Allocator const &alloc)
vector (vector &&other)
vector (vector &&other, Allocator const &alloc)
```

---

```

vector (std::initializer_list<T> init, Allocator const &alloc)
~vector ()

vector &operator= (vector const &other)
vector &operator= (vector &&other)

allocator_type get_allocator () const
 Returns the allocator associated with the container.

reference operator[] (size_type pos)
const_reference operator[] (size_type pos) const

pointer data ()
 Returns pointer to the underlying array serving as element storage. The pointer is such that range [data(); data() + size()] is always a valid range, even if the container is empty (data() is not dereferenceable in that case).

const_pointer data () const
 Returns pointer to the underlying array serving as element storage. The pointer is such that range [data(); data() + size()] is always a valid range, even if the container is empty (data() is not dereferenceable in that case).

T *device_data () const
 Returns a raw pointer corresponding to the address of the data allocated on the device.

std::size_t size () const
std::size_t capacity () const

bool empty () const
 Returns: size() == 0.

void resize (size_type)
 Effects: If size <= size(), equivalent to calling pop_back() size() - size times. If size() < size, appends size - size default-inserted elements to the sequence.

 Requires: T shall be MoveInsertable and DefaultInsertable into *this.

 Remarks: If an exception is thrown other than by the move constructor of a non-CopyInsertable T there are no effects.

void resize (size_type, T const&)
 Effects: If size <= size(), equivalent to calling pop_back() size() - size times. If size() < size, appends size - size copies of val to the sequence.

 Requires: T shall be CopyInsertable into *this.

 Remarks: If an exception is thrown there are no effects.

iterator begin ()
iterator end ()

const_iterator cbegin () const
const_iterator cend () const
const_iterator begin () const

```

```
const_iterator end() const
void swap(vector &other)
 Effects: Exchanges the contents and capacity() of *this with that of x.
 Complexity: Constant time.

void clear()
 Effects: Erases all elements in the range [begin(),end()). Destroys all elements in a. Invalidates all references, pointers, and iterators referring to the elements of a and may invalidate the past-the-end iterator.

 Post: a.empty() returns true.
 Complexity: Linear.
```

See *Public API* for a list of names that are part of the public *HPX API*.

## distribution\_policies

The contents of this module can be included with the header `hpx/modules/distribution_policies.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/distribution_policies.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX API*.

### namespace hpx

#### namespace components

##### Variables

```
HPX_INLINE_CONSTEXPR_VARIABLE char const* const hpx::components::default_binpacking
const binpacking_distribution_policy binpacked = {}

A predefined instance of the binpacking distribution_policy. It will represent the local locality and
will place all items to create here.

struct binpacking_distribution_policy
#include <binpacking_distribution_policy.hpp> This class specifies the parameters for a binpacking
distribution policy to use for creating a given number of items on a given set of localities. The
binpacking policy will distribute the new objects in a way such that each of the localities will equalize
the number of overall objects of this type based on a given criteria (by default this criteria is the overall
number of objects of this type).
```

## Public Functions

### `binpacking_distribution_policy()`

Default-construct a new instance of a binpacking\_distribution\_policy. This policy will represent one locality (the local locality).

```
binpacking_distribution_policy operator() (std::vector<id_type> const &locs,
```

```
 char const *perf_counter_name = de-
```

```
fault_binpacking_counter_name) const
```

Create a new *default\_distribution* policy representing the given set of localities.

#### Parameters

- `locs`: [in] The list of localities the new instance should represent
- `perf_counter_name`: [in] The name of the performance counter which should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

```
binpacking_distribution_policy operator() (std::vector<id_type> &&locs, char
```

```
 const *perf_counter_name = de-
```

```
fault_binpacking_counter_name) const
```

Create a new *default\_distribution* policy representing the given set of localities.

#### Parameters

- `locs`: [in] The list of localities the new instance should represent
- `perf_counter_name`: [in] The name of the performance counter which should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

```
binpacking_distribution_policy operator() (id_type const &loc, char
```

```
 const *perf_counter_name = de-
```

```
fault_binpacking_counter_name) const
```

Create a new *default\_distribution* policy representing the given locality

#### Parameters

- `loc`: [in] The locality the new instance should represent
- `perf_counter_name`: [in] The name of the performance counter that should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

```
template<typename Component, typename ...Ts>
```

```
hpx::future<hpx::id_type> create (Ts&&... vs) const
```

Create one object on one of the localities associated by this policy instance

**Return** A future holding the global address which represents the newly created object

#### Parameters

- `vs`: [in] The arguments which will be forwarded to the constructor of the new object.

```
template<typename Component, typename ...Ts>
```

```
hpx::future<std::vector<bulk_locality_result>> bulk_create (std::size_t count, Ts&&... vs)
```

```
 const
```

Create multiple objects on the localities associated by this policy instance

**Return** A future holding the list of global addresses which represent the newly created objects

**Parameters**

- count: [in] The number of objects to create
- vs: [in] The arguments which will be forwarded to the constructors of the new objects.

`std::string const &get_counter_name() const`

Returns the name of the performance counter associated with this policy instance.

`std::size_t get_num_localities() const`

Returns the number of associated localities for this distribution policy

**Note** This function is part of the creation policy implemented by this class

`namespace hpx`

`namespace components`

**Variables**

`const colocating_distribution_policy colocated = {}`

A predefined instance of the co-locating *distribution\_policy*. It will represent the local locality and will place all items to create here.

`struct colocating_distribution_policy`

`#include <colocating_distribution_policy.hpp>` This class specifies the parameters for a distribution policy to use for creating a given number of items on the locality where a given object is currently placed.

**Public Functions**

`colocating_distribution_policy()`

Default-construct a new instance of a colocating\_distribution\_policy. This policy will represent the local locality.

`colocating_distribution_policy operator()(id_type const &id) const`

Create a new colocating\_distribution\_policy representing the locality where the given object is current located

**Parameters**

- id: [in] The global address of the object with which the new instances should be colocated on

`template<typename Client, typename Stub>`

`colocating_distribution_policy operator()(client_base<Client, Stub> const &client)`

`const`

Create a new colocating\_distribution\_policy representing the locality where the given object is current located

**Parameters**

- client: [in] The client side representation of the object with which the new instances should be colocated on

`template<typename Component, typename ...Ts>`

`hpx::future<hpx::id_type> create(Ts&&... vs) const`  
Create one object on the locality of the object this distribution policy instance is associated with

**Note** This function is part of the placement policy implemented by this class.

**Return** A future holding the global address which represents the newly created object

## Parameters

- vs: [in] The arguments which will be forwarded to the constructor of the new object.

```
template<typename Component, typename ...Ts>
hpx::future<std::vector<bulk_locality_result>> bulk_create (std::size_t count, Ts&... vs)
 const
 Create multiple objects colocated with the object represented by this policy instance
```

**Note** This function is part of the placement policy implemented by this class.

**Return** A future holding the list of global addresses which represent the newly created objects

## Parameters

- `count`: [in] The number of objects to create
  - `vs`: [in] The arguments which will be forwarded to the constructors of the new objects.

```
template<typename Action, typename ...Ts>
async_result<Action>::type async (launch policy, Ts&&... vs) const
```

```
template<typename Action, typename Callback, typename ...Ts>
async_result<Action>::type async_cb (launch policy, Callback &&cb, Ts&&... vs) const
```

**Note** This function is part of the invocation policy implemented by this class.

```
template<typename Action, typename Continuation, typename ...Ts>
bool apply(Continuation &&c, threads::thread_priority priority, Ts&&... vs) const
```

**Note** This function is part of the invocation policy implemented by this class.

```
template<typename Action, typename ...Ts>
bool apply(threads::thread_priority priority, Ts&&... vs) const
```

```
template<typename Action, typename Continuation, typename Callback, typename ...Ts>

 vs) const
```

**Note** This function is part of the invocation policy implemented by this class.

```
template<typename Action, typename Callback, typename ...Ts>
bool apply_cb(threads::thread_priority priority, Callback &&cb, Ts&&... vs) const
```

`std::size_t get_num_localities() const`

Returns the number of associated localities for this distribution policy

Note: This section is not suitable for:

**Note** This function is part of the creation policy implemented by this class.

```
void type::get_next_target() const
```

Returns the locality which

**Action** must assume result

```
#include <allocating_distribution_policy.hpp>
```

## Public Types

```

A predefined instance of the target\_distribution\_policy. It will represent the local locality and will place all items to create here.

```
struct target_distribution_policy
```

#include <target\_distribution\_policy.hpp> This class specifies the parameters for a simple distribution policy to use for creating (and evenly distributing) a given number of items on a given set of localities.

**Public Functions**

```
target_distribution_policy()
```

Default-construct a new instance of a target\_distribution\_policy. This policy will represent one locality (the local locality).

```
target_distribution_policy operator()(id_type const &id) const
```

Create a new target\_distribution\_policy representing the given locality

**Parameters**

- `loc`: [in] The locality the new instance should represent

```
template<typename Component, typename ...Ts>
```

```
hpx::future<hpx::id_type> create(Ts&&... vs) const
```

Create one object on one of the localities associated by this policy instance

**Note** This function is part of the placement policy implemented by this class

**Return** A future holding the global address which represents the newly created object

**Parameters**

- `vs`: [in] The arguments which will be forwarded to the constructor of the new object.

```
template<typename Component, typename ...Ts>
hpx::future<std::vector<bulk_locality_result>> bulk_create (std::size_t count, Ts&&... vs)
const
Create multiple objects on the localities associated by this policy instance
```

**Note** This function is part of the placement policy implemented by this class

**Return** A future holding the list of global addresses which represent the newly created objects  
**Parameters**

- `count`: [in] The number of objects to create

### executors\_distributed

The contents of this module can be included with the header `hpx/modules/executors_distributed.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/executors_distributed.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

```
namespace hpx
```

```
 namespace parallel
```

```
 namespace execution
```

## Functions

```
template<typename DistPolicy>
distribution_policy_executor<typename std::decay<DistPolicy>::type> make_distribution_policy_executor
```

Create a new *distribution\_policy\_executor* from the given *distribution\_policy*.

### Parameters

- *policy*: The *distribution\_policy* to create an executor from

```
template<typename DistPolicy>
class distribution_policy_executor
```

*#include <distribution\_policy\_executor.hpp>* A *distribution\_policy\_executor* creates groups of parallel execution agents which execute in threads implicitly created by the executor and placed on any of the associated localities.

### Template Parameters

- *DistPolicy*: The *distribution policy* type for which an executor should be created. The expression `hpx::traits::is_distribution_policy<DistPolicy>::value` must evaluate to true.

## Public Functions

```
template<typename DistPolicy_, typename Enable = typename std::enable_if<!std::is_same<distribution_
distribution_policy_executor(DistPolicy_ &&policy)
Create a new distribution_policy executor from the given distribution policy
```

### Parameters

- **policy**: The distribution\_policy to create an executor from

## Private Members

See *Public API* for a list of names that are part of the public HPX API.

## namespace hpx

### Functions

```
int finalize(double shutdown_timeout, double localwait = -1.0, error_code &ec = throws)
Main function to gracefully terminate the HPX runtime system.
```

The function `hpx::finalize` is the main way to (gracefully) exit any HPX application. It should be called from one locality only (usually the console) and it will notify all connected localities to finish execution. Only after all other localities have exited this function will return, allowing to exit the console locality as well.

During the execution of this function the runtime system will invoke all registered shutdown functions (see `hpx::init`) on all localities.

The default value (-1.0) will try to find a globally set timeout value (can be set as the configuration parameter `hpx.shutdown_timeout`), and if that is not set or -1.0 as well, it will disable any timeout, each connected locality will wait for all existing HPX-threads to terminate.

### Parameters

- `shutdown_timeout`: This parameter allows to specify a timeout (in microseconds), specifying how long any of the connected localities should wait for pending tasks to be executed. After this timeout, all suspended HPX-threads will be aborted. Note, that this function will not abort any running HPX-threads. In any case the shutdown will not proceed as long as there is at least one pending/running HPX-thread.

The default value (`-1.0`) will try to find a globally set wait time value (can be set as the configuration parameter “`hpx.finalize_wait_time`”), and if this is not set or `-1.0` as well, it will disable any addition local wait time before proceeding.

#### Parameters

- `localwait`: This parameter allows to specify a local wait time (in microseconds) before the connected localities will be notified and the overall shutdown process starts.

This function will block and wait for all connected localities to exit before returning to the caller. It should be the last HPX-function called by any application.

**Return** This function will always return zero.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Using this function is an alternative to `hpx::disconnect`, these functions do not need to be called both.

```
int finalize(error_code &ec = throws)
```

Main function to gracefully terminate the HPX runtime system.

The function `hpx::finalize` is the main way to (gracefully) exit any HPX application. It should be called from one locality only (usually the console) and it will notify all connected localities to finish execution. Only after all other localities have exited this function will return, allowing to exit the console locality as well.

During the execution of this function the runtime system will invoke all registered shutdown functions (see `hpx::init`) on all localities.

This function will block and wait for all connected localities to exit before returning to the caller. It should be the last HPX-function called by any application.

**Return** This function will always return zero.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Using this function is an alternative to `hpx::disconnect`, these functions do not need to be called both.

```
HPX_NORETURN void hpx::terminate()
```

Terminate any application non-gracefully.

The function `hpx::terminate` is the non-graceful way to exit any application immediately. It can be called from any locality and will terminate all localities currently used by the application.

**Note** This function will cause HPX to call `std::terminate()` on all localities associated with this application. If the function is called not from an HPX thread it will fail and return an error using the argument `ec`.

```
int disconnect (double shutdown_timeout, double localwait = -1.0, error_code &ec = throws)
 Disconnect this locality from the application.
```

The function `hpx::disconnect` can be used to disconnect a locality from a running HPX application.

During the execution of this function the runtime system will invoke all registered shutdown functions (see `hpx::init`) on this locality. The default value (-1.0) will try to find a globally set timeout value (can be set as the configuration parameter “`hpx.shutdown_timeout`”), and if that is not set or -1.0 as well, it will disable any timeout, each connected locality will wait for all existing HPX-threads to terminate.

#### Parameters

- `shutdown_timeout`: This parameter allows to specify a timeout (in microseconds), specifying how long this locality should wait for pending tasks to be executed. After this timeout, all suspended HPX-threads will be aborted. Note, that this function will not abort any running HPX-threads. In any case the shutdown will not proceed as long as there is at least one pending/running HPX-thread.

The default value (-1.0) will try to find a globally set wait time value (can be set as the configuration parameter `hpx.finalize_wait_time`), and if this is not set or -1.0 as well, it will disable any addition local wait time before proceeding.

#### Parameters

- `localwait`: This parameter allows to specify a local wait time (in microseconds) before the connected localities will be notified and the overall shutdown process starts.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called by any locality being disconnected.

**Return** This function will always return zero.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
int disconnect (error_code &ec = throws)
 Disconnect this locality from the application.
```

The function `hpx::disconnect` can be used to disconnect a locality from a running HPX application.

During the execution of this function the runtime system will invoke all registered shutdown functions (see `hpx::init`) on this locality.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called by any locality being disconnected.

**Return** This function will always return zero.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

#### Parameters

- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
int stop (error_code &ec = throws)
 Stop the runtime system.
```

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called on every locality. This function should be used only if the runtime system was started using *hpx::start*.

**Return** The function returns the value, which has been returned from the user supplied main HPX function (usually *hpx\_main*).

```
namespace hpx
```

## Functions

```
int init (std::function<int> hpx::program_options::variables_map &
>f, int argc, char **argv, init_params const ¶ms = init_params())
Main entry point for launching the HPX runtime system.
```

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users *main()* function. It will set up the HPX runtime environment and schedule the function given by *f* as a HPX thread. This overload will not call *hpx\_main*.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users *main()* function. It will set up the HPX runtime environment and schedule the function given by *f* as a HPX thread.

**Return** The function returns the value, which has been returned from the user supplied *f*.

**Note** If the parameter *mode* is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in *argc/argv*. Otherwise it will be executed as specified by the parameter *mode*.

#### Parameters

- *f*: [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If *f* is *nullptr* the HPX runtime environment will be started without invoking *f*.
- *argc*: [in] The number of command line arguments passed in *argv*. This is usually the unchanged value as passed by the operating system (to *main()*).
- *argv*: [in] The command line arguments for this application, usually that is the value as passed by the operating system (to *main()*).
- *params*: [in] The parameters to the *hpx::init* function (See documentation of *hpx::init\_params*)

---

```
int init (std::function<int> int, char**>
 f, int argc, char **argv, init_params const ¶ms = init_params())Main entry point for launching
the HPX runtime system.
```

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. This overload will not call `hpx_main`.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread.

**Return** The function returns the value, which has been returned from the user supplied `f`.

**Note** If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc/argv`. Otherwise it will be executed as specified by the `parametermode`.

### Parameters

- `f`: [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If `f` is `nullptr` the HPX runtime environment will be started without invoking `f`.
- `argc`: [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- `argv`: [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- `params`: [in] The parameters to the `hpx::init` function (See documentation of `hpx::init_params`)

```
int init (int argc, char **argv, init_params const ¶ms = init_params())
```

Main entry point for launching the HPX runtime system.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. This overload will not call `hpx_main`.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread.

**Return** The function returns the value, which has been returned from the user supplied `f`.

**Note** If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc/argv`. Otherwise it will be executed as specified by the `parametermode`.

### Parameters

- `argc`: [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- `argv`: [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- `params`: [in] The parameters to the `hpx::init` function (See documentation of `hpx::init_params`)

```
int init (std::nullptr_t f, int argc, char **argv, init_params const ¶ms = init_params())
```

Main entry point for launching the HPX runtime system.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. This overload will not call `hpx_main`.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread.

**Return** The function returns the value, which has been returned from the user supplied `f`.

**Note** If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc/argv`. Otherwise it will be executed as specified by the parameter `mode`.

#### Parameters

- `f`: [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If `f` is `nullptr` the HPX runtime environment will be started without invoking `f`.
- `argc`: [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- `argv`: [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- `params`: [in] The parameters to the `hpx::init` function (See documentation of `hpx::init_params`)

```
int init (init_params const ¶ms = init_params())
```

Main entry point for launching the HPX runtime system.

This is a simplified main entry point, which can be used to set up the runtime for an HPX application (the runtime system will be set up in console mode or worker mode depending on the command line settings).

This is a simplified main entry point, which can be used to set up the runtime for an HPX application (the runtime system will be set up in console mode or worker mode depending on the command line settings).

**Return** The function returns the value, which has been returned from `hpx_main` (or 0 when executed in worker mode).

**Note** The created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc/argv`. If no command line arguments are passed, console mode is assumed.

**Note** If no command line arguments are passed the HPX runtime system will not support any of the default command line options as described in the section ‘HPX Command Line Options’.

#### Parameters

- `params`: [in] The parameters to the `hpx::init` function (See documentation of `hpx::init_params`)

**namespace hpx**

```
struct init_params
```

```
#include <hpx_init_params.hpp> Parameters used to initialize the HPX runtime through hpx::init and hpx::start.
```

## Public Members

```

hpx::resource::partitioner_mode rp_mode = ::hpx::resource::mode_default
hpx::resource::rp_callback_type rp_callback

namespace hpx
```

## Functions

bool **start** (std::function<int> *hpx::program\_options::variables\_map*&  
*>f, int argc, char \*\*argv, init\_params const &params = init\_params()* Main non-blocking entry point  
 for launching the HPX runtime system.

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution. This overload will not call `hpx_main`.

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as an HPX thread. It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution.

**Return** The function returns *true* if command line processing succeeded and the runtime system was started successfully. It will return *false* otherwise.

**Note** If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc/argv`. Otherwise it will be executed as specified by the `parametermode`.

### Parameters

- `f`: [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If `f` is `nullptr` the HPX runtime environment will be started without invoking `f`.
- `argc`: [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- `argv`: [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- `params`: [in] The parameters to the `hpx::start` function (See documentation of `hpx::init_params`)

bool **start** (std::function<int> *int, char\*\*>f, int argc, char \*\*argv, init\_params const &params = init\_params()* Main non-blocking entry point  
 for launching the HPX runtime system.

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. It will return immediately after that. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution. This overload will not call `hpx_main`.

This is the main, non-blocking entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. Use `hpx::wait` and `hpx::stop` to synchronize with the runtime system's execution.

**Return** The function returns `true` if command line processing succeeded and the runtime system was started successfully. It will return `false` otherwise.

**Note** The created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc/argv`. If no command line arguments are passed, console mode is assumed.

**Note** If no command line arguments are passed the HPX runtime system will not support any of the default command line options as described in the section ‘HPX Command Line Options’.

### Parameters

- `params`: [in] The parameters to the `hpx::start` function (See documentation of `hpx::init_params`)

**namespace hpx**

## Functions

`int suspend(error_code &ec = throws)`

Suspend the runtime system.

The function `hpx::suspend` is used to suspend the HPX runtime system. It can only be used when running HPX on a single locality. It will block waiting for all thread pools to be empty. This function only be called when the runtime is running, or already suspended in which case this function will do nothing.

**Return** This function will always return zero.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`int resume(error_code &ec = throws)`

Resume the HPX runtime system.

The function `hpx::resume` is used to resume the HPX runtime system. It can only be used when running HPX on a single locality. It will block waiting for all thread pools to be resumed. This function only be called when the runtime suspended, or already running in which case this function will do nothing.

**Return** This function will always return zero.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

## Functions

```
id_type unmanaged (id_type const &id)
```

The helper function `hpx::unmanaged` can be used to generate a global identifier which does not participate in the automatic garbage collection.

**Return** This function returns a new global id referencing the same object as the parameter `id`. The only difference is that the returned global identifier does not participate in the automatic garbage collection.

**Note** This function allows to apply certain optimizations to the process of memory management in HPX. It however requires the user to take full responsibility for keeping the referenced objects alive long enough.

**Parameters**

- `id`: [in] The id to generate the unmanaged global id from. This parameter can be itself a managed or an unmanaged global id.

**performance\_counters**

The contents of this module can be included with the header `hpx/modules/performance_counters.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/performance_counters.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public HPX API.

class base_performance_counter
```

## Public Types

```
typedef Derived type_holder
typedef hpx::performance_counters::server::base_performance_counter base_type_holder
```

## Public Functions

```
base_performance_counter()
base_performance_counter(hpx::performance_counters::counter_info const &info)
void finalize()
```

## Private Types

```
typedef hpx::components::component_base<Derived> base_type
namespace hpx
```

```
namespace agas
```

## Functions

```
void component_namespace_register_counter_types(error_code &ec = throws)
namespace hpx

namespace performance_counters
```

## Functions

```
bool default_counter_discoverer(counter_info const&, discover_counter_func const&, discover_counters_mode, error_code&)
```

Default discovery function for performance counters; to be registered with the counter types. It will pass the counter\_info and the *error\_code* to the supplied function.

```
bool locality_counter_discoverer(counter_info const&, discover_counter_func const&, discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>(locality#<locality\_id>/total)/<instancename>

```
bool locality_pool_counter_discoverer(counter_info const&, discover_cover_counter_func const&, discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>(locality#<locality\_id>/pool#<pool\_name>/total)/<instancename>

```
bool locality0_counter_discoverer(counter_info const&, discover_counter_func const&, discover_counters_mode, error_code&)
```

Default discoverer function for AGAS performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>{locality#0/total}/<instancename>

```
bool locality_thread_counter_discoverer(counter_info const&, discover_cover_counter_func const&, discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>(locality#<locality\_id>/worker-thread#<threadnum>)/<instancename>

```
bool locality_pool_thread_counter_discoverer(counter_info const &info, discover_cover_counter_func const &f, discover_counters_mode mode, error_code &ec)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>{locality#<locality\_id>/pool#<poolname>/thread#<threadnum>}/<instancename>

```
bool locality_pool_thread_no_total_counter_discoverer(counter_info const &info, discover_cover_counter_func const &f, discover_counters_mode mode, error_code &ec)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>{locality#<locality\_id>/pool#<poolname>/thread#<threadnum>}/<instancename>

This is essentially the same as above just that locality#\*/total is not supported.

```
bool locality_numa_counter_discoverer(counter_info const&, cover_counter_func const&, discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

```
/<objectname>(locality#<locality_id>/numa-node#<threadnum>)/<instancename>
```

```
naming::gid_type locality_raw_counter_creator(counter_info const&, hpx::util::function_nonser<std::int64_t> bool > const&, error_code&)
```

Creation function for raw counters. The passed function is encapsulating the actual value to monitor. This function checks the validity of the supplied counter name, it has to follow the scheme:

```
/<objectname>(locality#<locality_id>/total)/<instancename>
```

```
naming::gid_type locality_raw_values_counter_creator(counter_info const&, hpx::util::function_nonser<std::vector<std::int64_t>> const&, error_code&)
```

```
naming::gid_type agas_raw_counter_creator(counter_info const&, error_code&, char const*const)
```

Creation function for raw counters. The passed function is encapsulating the actual value to monitor. This function checks the validity of the supplied counter name, it has to follow the scheme:

```
/agas(<objectinstance>/total)/<instancename>
```

```
bool agas_counter_discoverer(counter_info const&, discover_counter_func const&, discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

```
/agas(<objectinstance>/total)/<instancename>
```

```
naming::gid_type local_action_invocation_counter_creator(counter_info const&, error_code&)
```

```
bool local_action_invocation_counter_discoverer(counter_info const&, discover_counter_func const&, discover_counters_mode, error_code&)
```

```
namespace hpx
```

```
namespace performance_counters
```

## Functions

```
hpx::future<id_type> create_performance_counter_async(id_type target_id, counter_info const &info)
```

```
id_type create_performance_counter(id_type target_id, counter_info const &info, error_code &ec = throws)
```

```
namespace hpx
```

```
namespace performance_counters
```

## Functions

```
namespace performance_counters
```

## TypeDefs

```
typedef hpx::util::function_nonser<naming::gid_type(counter_info const&, error_code&) >
create_counter_func
```

This declares the type of a function, which will be called by HPX whenever a new performance counter instance of a particular type needs to be created.

```
typedef hpx::util::function_nonser<bool(counter_info const&, error_code&) >
discover_counter_func
```

This declares a type of a function, which will be passed to a *discover\_counters\_func* in order to be called for each discovered performance counter instance.

```
typedef hpx::util::function_nonser<bool(counter_info const&, discover_counter_func
const&, discover_counters_mode, error_code&) >
discover_counters_func
```

This declares the type of a function, which will be called by HPX whenever it needs to discover all performance counter instances of a particular type.

## Enums

### **enum counter\_type**

*Values:*

#### **counter\_text**

*counter\_text* shows a variable-length text string. It does not deliver calculated values.

Formula: None Average: None Type: Text

#### **counter\_raw**

*counter\_raw* shows the last observed value only. It does not deliver an average.

Formula: None. Shows raw data as collected. Average: None Type: Instantaneous

#### **counter\_monotonically\_increasing**

#### **counter\_average\_base**

*counter\_average\_base* is used as the base data (denominator) in the computation of time or count averages for the *counter\_average\_count* and *counter\_average\_timer* counter types. This counter type collects the last observed value only.

Formula: None. This counter uses raw data in fractional calculations without delivering an output. Average:  $\text{SUM}(\text{N}) / \text{x}$  Type: Instantaneous

#### **counter\_average\_count**

*counter\_average\_count* shows how many items are processed, on average, during an operation. Counters of this type display a ratio of the items processed (such as bytes sent) to the number of operations completed. The ratio is calculated by comparing the number of items processed during the last interval to the number of operations completed during the last interval.

Formula:  $(\text{N}_1 - \text{N}_0) / (\text{D}_1 - \text{D}_0)$ , where the numerator (N) represents the number of items processed during the last sample interval, and the denominator (D) represents the number of operations completed during the last two sample intervals. Average:  $(\text{N}_x - \text{N}_0) / (\text{D}_x - \text{D}_0)$  Type: Average

#### **counter\_aggregating**

*counter\_aggregating* applies a function to an embedded counter instance. The embedded counter is usually evaluated repeatedly after a fixed (but configurable) time interval.

Formula:  $F(\text{N}_x)$

#### **counter\_average\_timer**

*counter\_average\_timer* measures the average time it takes to complete a process or operation. Counters of this type display a ratio of the total elapsed time of the sample interval to the number of processes or operations completed during that time. This counter type measures time in ticks of the system clock. The variable F represents the number of ticks per second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula:  $((\text{N}_1 - \text{N}_0) / F) / (\text{D}_1 - \text{D}_0)$ , where the numerator (N) represents the number of ticks counted during the last sample interval, the variable F represents the frequency of the ticks, and the denominator (D) represents the number of operations completed during the last sample interval. Average:  $((\text{N}_x - \text{N}_0) / F) / (\text{D}_x - \text{D}_0)$  Type: Average

#### **counter\_elapsed\_time**

*counter\_elapsed\_time* shows the total time between when the component or process started and the time when this value is calculated. The variable F represents the number of time units that elapse in one second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula:  $(D_0 - N_0) / F$ , where the nominator (D) represents the current time, the numerator (N) represents the time the object was started, and the variable F represents the number of time units that elapse in one second. Average:  $(D_x - N_0) / F$  Type: Difference

**counter\_histogram**

*counter\_histogram* exposes a histogram of the measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter\_value\_array* instead of a *counter\_value*. Those will also not implement the *get\_counter\_value()* functionality. The results are exposed through a separate *get\_counter\_values\_array()* function.

The first three values in the returned array represent the lower and upper boundaries, and the size of the histogram buckets. All remaining values in the returned array represent the number of measurements for each of the buckets in the histogram.

**counter\_raw\_values**

*counter\_raw\_values* exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter\_value\_array* instead of a *counter\_value*. Those will also not implement the *get\_counter\_value()* functionality. The results are exposed through a separate *get\_counter\_values\_array()* function.

**counter\_text**

*counter\_text* shows a variable-length text string. It does not deliver calculated values.

Formula: None Average: None Type: Text

**counter\_raw**

*counter\_raw* shows the last observed value only. It does not deliver an average.

Formula: None. Shows raw data as collected. Average: None Type: Instantaneous

**counter\_monotonically\_increasing****counter\_average\_base**

*counter\_average\_base* is used as the base data (denominator) in the computation of time or count averages for the *counter\_average\_count* and *counter\_average\_timer* counter types. This counter type collects the last observed value only.

Formula: None. This counter uses raw data in fractional calculations without delivering an output. Average:  $\text{SUM}(N) / x$  Type: Instantaneous

**counter\_average\_count**

*counter\_average\_count* shows how many items are processed, on average, during an operation. Counters of this type display a ratio of the items processed (such as bytes sent) to the number of operations completed. The ratio is calculated by comparing the number of items processed during the last interval to the number of operations completed during the last interval.

Formula:  $(N_1 - N_0) / (D_1 - D_0)$ , where the numerator (N) represents the number of items processed during the last sample interval, and the denominator (D) represents the number of operations completed during the last two sample intervals. Average:  $(N_x - N_0) / (D_x - D_0)$  Type: Average

**counter\_aggregating**

*counter\_aggregating* applies a function to an embedded counter instance. The embedded counter is usually evaluated repeatedly after a fixed (but configurable) time interval.

Formula:  $F(N_x)$

**counter\_average\_timer**

*counter\_average\_timer* measures the average time it takes to complete a process or operation. Counters of this type display a ratio of the total elapsed time of the sample interval to the number of processes or operations completed during that time. This counter type measures time in ticks

of the system clock. The variable F represents the number of ticks per second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula:  $((N_1 - N_0) / F) / (D_1 - D_0)$ , where the numerator (N) represents the number of ticks counted during the last sample interval, the variable F represents the frequency of the ticks, and the denominator (D) represents the number of operations completed during the last sample interval.  
Average:  $((N_x - N_0) / F) / (D_x - D_0)$  Type: Average

#### **counter\_elapsed\_time**

*counter\_elapsed\_time* shows the total time between when the component or process started and the time when this value is calculated. The variable F represents the number of time units that elapse in one second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula:  $(D_0 - N_0) / F$ , where the nominator (D) represents the current time, the numerator (N) represents the time the object was started, and the variable F represents the number of time units that elapse in one second. Average:  $(D_x - N_0) / F$  Type: Difference

#### **counter\_histogram**

*counter\_histogram* exposes a histogram of the measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter\_value\_array* instead of a *counter\_value*. Those will also not implement the *get\_counter\_value()* functionality. The results are exposed through a separate *get\_counter\_values\_array()* function.

The first three values in the returned array represent the lower and upper boundaries, and the size of the histogram buckets. All remaining values in the returned array represent the number of measurements for each of the buckets in the histogram.

#### **counter\_raw\_values**

*counter\_raw\_values* exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter\_value\_array* instead of a *counter\_value*. Those will also not implement the *get\_counter\_value()* functionality. The results are exposed through a separate *get\_counter\_values\_array()* function.

### **enum counter\_status**

Status and error codes used by the functions related to performance counters.

*Values:*

#### **status\_valid\_data**

No error occurred, data is valid.

#### **status\_new\_data**

Data is valid and different from last call.

#### **status\_invalid\_data**

Some error occurred, data is not value.

#### **status\_already\_defined**

The type or instance already has been defined.

#### **status\_counter\_unknown**

The counter instance is unknown.

#### **status\_counter\_type\_unknown**

The counter type is unknown.

#### **status\_generic\_error**

A unknown error occurred.

#### **status\_valid\_data**

No error occurred, data is valid.

```
status_new_data
 Data is valid and different from last call.

status_invalid_data
 Some error occurred, data is not value.

status_already_defined
 The type or instance already has been defined.

status_counter_unknown
 The counter instance is unknown.

status_counter_type_unknown
 The counter type is unknown.

status_generic_error
 A unknown error occurred.
```

## Functions

```
std::string &ensure_counter_prefix(std::string &name)

std::string ensure_counter_prefix(std::string const &counter)

std::string &remove_counter_prefix(std::string &name)

std::string remove_counter_prefix(std::string const &counter)

char const *get_counter_type_name(counter_type state)
 Return the readable name of a given counter type.

bool status_is_valid(counter_status s)

counter_status add_counter_type(counter_info const &info, error_code &ec)

naming::id_type get_counter(std::string const &name, error_code &ec)

naming::id_type get_counter(counter_info const &info, error_code &ec)
```

## Variables

```
constexpr const char counter_prefix[] = "/counters"

constexpr std::size_t counter_prefix_len = (sizeof(counter_prefix) / sizeof(counter_prefix[0])) - 1

struct counter_info
```

## Public Functions

```
counter_info(counter_type type = counter_raw)

counter_info(std::string const &name)

counter_info(counter_type type, std::string const &name, std::string const &help-
text = "", std::uint32_t version = HPX_PERFORMANCE_COUNTER_V1,
std::string const &uom = "")
```

## Public Members

*counter\_type* **type\_**

The type of the described counter.

*std::uint32\_t* **version\_**

The version of the described counter using the 0xMMmmSSSS scheme

*counter\_status* **status\_**

The status of the counter object.

*std::string* **fullname\_**

The full name of this counter.

*std::string* **helptext\_**

The full descriptive text for this counter.

*std::string* **unit\_of\_measure\_**

The unit of measure for this counter.

## Private Functions

**void** **serialize** (*serialization::output\_archive* &*ar*, **const** *unsigned int*)

**counter\_average\_timer**

*counter\_average\_timer* measures the average time it takes to complete a process or operation. Counters of this type display a ratio of the total elapsed time of the sample interval to the number of processes or operations completed during that time. This counter type measures time in ticks of the system clock. The variable F represents the number of ticks per second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula:  $((N_1 - N_0) / F) / (D_1 - D_0)$ , where the numerator (N) represents the number of ticks counted during the last sample interval, the variable F represents the frequency of the ticks, and the denominator (D) represents the number of operations completed during the last sample interval. Average:  $((N_x - N_0) / F) / (D_x - D_0)$  Type: Average

**counter\_elapsed\_time**

*counter\_elapsed\_time* shows the total time between when the component or process started and the time when this value is calculated. The variable F represents the number of time units that elapse in one second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula:  $(D_0 - N_0) / F$ , where the nominator (D) represents the current time, the numerator (N) represents the time the object was started, and the variable F represents the number of time units that elapse in one second. Average:  $(D_x - N_0) / F$  Type: Difference

**counter\_histogram**

*counter\_histogram* exposes a histogram of the measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter\_value\_array* instead of a *counter\_value*. Those will also not implement the *get\_counter\_value()* functionality. The results are exposed through a separate *get\_counter\_values\_array()* function.

The first three values in the returned array represent the lower and upper boundaries, and the size of the histogram buckets. All remaining values in the returned array represent the number of measurements for each of the buckets in the histogram.

**counter\_raw\_values**

*counter\_raw\_values* exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter\_value\_array* instead of a

`counter_value`. Those will also not implement the `get_counter_value()` functionality. The results are exposed through a separate `get_counter_values_array()` function.

#### **counter\_text**

`counter_text` shows a variable-length text string. It does not deliver calculated values.

Formula: None Average: None Type: Text

#### **counter\_raw**

`counter_raw` shows the last observed value only. It does not deliver an average.

Formula: None. Shows raw data as collected. Average: None Type: Instantaneous

#### **counter\_monotonically\_increasing**

##### **counter\_average\_base**

`counter_average_base` is used as the base data (denominator) in the computation of time or count averages for the `counter_average_count` and `counter_average_timer` counter types. This counter type collects the last observed value only.

Formula: None. This counter uses raw data in factional calculations without delivering an output.  
Average: SUM (N) / x Type: Instantaneous

##### **counter\_average\_count**

`counter_average_count` shows how many items are processed, on average, during an operation. Counters of this type display a ratio of the items processed (such as bytes sent) to the number of operations completed. The ratio is calculated by comparing the number of items processed during the last interval to the number of operations completed during the last interval.

Formula:  $(N_1 - N_0) / (D_1 - D_0)$ , where the numerator (N) represents the number of items processed during the last sample interval, and the denominator (D) represents the number of operations completed during the last two sample intervals. Average:  $(N_x - N_0) / (D_x - D_0)$  Type: Average

##### **counter\_aggregating**

`counter_aggregating` applies a function to an embedded counter instance. The embedded counter is usually evaluated repeatedly after a fixed (but configurable) time interval.

Formula:  $F(N_x)$

##### **counter\_average\_timer**

`counter_average_timer` measures the average time it takes to complete a process or operation. Counters of this type display a ratio of the total elapsed time of the sample interval to the number of processes or operations completed during that time. This counter type measures time in ticks of the system clock. The variable F represents the number of ticks per second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula:  $((N_1 - N_0) / F) / (D_1 - D_0)$ , where the numerator (N) represents the number of ticks counted during the last sample interval, the variable F represents the frequency of the ticks, and the denominator (D) represents the number of operations completed during the last sample interval.  
Average:  $((N_x - N_0) / F) / (D_x - D_0)$  Type: Average

##### **counter\_elapsed\_time**

`counter_elapsed_time` shows the total time between when the component or process started and the time when this value is calculated. The variable F represents the number of time units that elapse in one second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula:  $(D_0 - N_0) / F$ , where the nominator (D) represents the current time, the numerator (N) represents the time the object was started, and the variable F represents the number of time units that elapse in one second. Average:  $(D_x - N_0) / F$  Type: Difference

**counter\_histogram**

*counter\_histogram* exposes a histogram of the measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter\_value\_array* instead of a *counter\_value*. Those will also not implement the *get\_counter\_value()* functionality. The results are exposed through a separate *get\_counter\_values\_array()* function.

The first three values in the returned array represent the lower and upper boundaries, and the size of the histogram buckets. All remaining values in the returned array represent the number of measurements for each of the buckets in the histogram.

**counter\_raw\_values**

*counter\_raw\_values* exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter\_value\_array* instead of a *counter\_value*. Those will also not implement the *get\_counter\_value()* functionality. The results are exposed through a separate *get\_counter\_values\_array()* function.

**enum counter\_status**

*Values:*

**status\_valid\_data**

No error occurred, data is valid.

**status\_new\_data**

Data is valid and different from last call.

**status\_invalid\_data**

Some error occurred, data is not value.

**status\_already\_defined**

The type or instance already has been defined.

**status\_counter\_unknown**

The counter instance is unknown.

**status\_counter\_type\_unknown**

The counter type is unknown.

**status\_generic\_error**

A unknown error occurred.

**status\_valid\_data**

No error occurred, data is valid.

**status\_new\_data**

Data is valid and different from last call.

**status\_invalid\_data**

Some error occurred, data is not value.

**status\_already\_defined**

The type or instance already has been defined.

**status\_counter\_unknown**

The counter instance is unknown.

**status\_counter\_type\_unknown**

The counter type is unknown.

**status\_generic\_error**

A unknown error occurred.

**enum discover\_counters\_mode**

*Values:*

---

```
discover_counters_minimal
discover_counters_full
```

## Functions

*counter\_status* **get\_counter\_type\_name** (*counter\_type\_path\_elements const &path, std::string &result, error\_code &ec = throws*)

Create a full name of a counter type from the contents of the given *counter\_type\_path\_elements* instance. The generated counter type name will not contain any parameters.

*counter\_status* **get\_full\_counter\_type\_name** (*counter\_type\_path\_elements const &path, std::string &result, error\_code &ec = throws*)

Create a full name of a counter type from the contents of the given *counter\_type\_path\_elements* instance. The generated counter type name will contain all parameters.

*counter\_status* **get\_counter\_name** (*counter\_path\_elements const &path, std::string &result, error\_code &ec = throws*)

Create a full name of a counter from the contents of the given *counter\_path\_elements* instance.

*counter\_status* **get\_counter\_instance\_name** (*counter\_path\_elements const &path, std::string &result, error\_code &ec = throws*)

Create a name of a counter instance from the contents of the given *counter\_path\_elements* instance.

*counter\_status* **get\_counter\_type\_path\_elements** (*std::string const &name, counter\_type\_path\_elements &path, error\_code &ec = throws*)

Fill the given *counter\_type\_path\_elements* instance from the given full name of a counter type.

*counter\_status* **get\_counter\_path\_elements** (*std::string const &name, counter\_path\_elements &path, error\_code &ec = throws*)

Fill the given *counter\_path\_elements* instance from the given full name of a counter.

*counter\_status* **get\_counter\_name** (*std::string const &name, std::string &countername, error\_code &ec = throws*)

Return the canonical counter instance name from a given full instance name.

*counter\_status* **get\_counter\_type\_name** (*std::string const &name, std::string &type\_name, error\_code &ec = throws*)

Return the canonical counter type name from a given (full) instance name.

*counter\_status* **complement\_counter\_info** (*counter\_info &info, counter\_info const &type\_info, error\_code &ec = throws*)

Complement the counter info if parent instance name is missing.

*counter\_status* **complement\_counter\_info** (*counter\_info &info, error\_code &ec = throws*)

*counter\_status* **add\_counter\_type** (*counter\_info const &info, create\_counter\_func const &create\_counter, discover\_counters\_func const &discover\_counters, error\_code &ec = throws*)

*counter\_status* **discover\_counter\_types** (*discover\_counter\_func const &discover\_counter, discover\_counters\_mode mode = discover\_counters\_minimal, error\_code &ec = throws*)

Call the supplied function for each registered counter type.

```
counter_status discover_counter_types (std::vector<counter_info> &counters,
 discover_counters_mode mode = discover_counters_minimal,
 error_code &ec = throws)
```

Return a list of all available counter descriptions.

```
counter_status discover_counter_type (std::string const &name,
 discover_counter_func const &discover_counter,
 discover_counters_mode mode = discover_counters_minimal,
 error_code &ec = throws)
```

Call the supplied function for the given registered counter type.

```
counter_status discover_counter_type (counter_info const &info,
 discover_counter_func const &discover_counter,
 discover_counters_mode mode = discover_counters_minimal,
 error_code &ec = throws)
```

```
counter_status discover_counter_type (std::string const &name,
 std::vector<counter_info> &counters,
 discover_counters_mode mode = discover_counters_minimal,
 error_code &ec = throws)
```

Return a list of matching counter descriptions for the given registered counter type.

```
counter_status discover_counter_type (counter_info const &info,
 std::vector<counter_info> &counters,
 discover_counters_mode mode = discover_counters_minimal,
 error_code &ec = throws)
```

```
bool expand_counter_info (counter_info const &, discover_counter_func const &, error_code &)
```

call the supplied function will all expanded versions of the supplied counter info.

This function expands all locality#\* and worker-thread#\* wild cards only.

```
counter_status remove_counter_type (counter_info const &info, error_code &ec = throws)
```

Remove an existing counter type from the (local) registry.

**Note** This doesn't remove existing counters of this type, it just inhibits defining new counters using this type.

```
counter_status get_counter_type (std::string const &name, counter_info &info, error_code &ec = throws)
```

Retrieve the counter type for the given counter name from the (local) registry.

```
lcos::future<naming::id_type> get_counter_async (std::string name, error_code &ec = throws)
```

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter name.

```
lcos::future<naming::id_type> get_counter_async (counter_info const &info, error_code &ec = throws)
```

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter info.

---

```
void get_counter_infos (counter_info const &info, counter_type &type, std::string &help-
text, std::uint32_t &version, error_code &ec = throws)
 Retrieve the meta data specific for the given counter instance.
```

```
void get_counter_infos (std::string name, counter_type &type, std::string &helptext,
std::uint32_t &version, error_code &ec = throws)
 Retrieve the meta data specific for the given counter instance.
```

### **struct counter\_value**

#### **Public Functions**

```
counter_value (std::int64_t value = 0, std::int64_t scaling = 1, bool scale_inverse = false)
```

```
template<typename T>
T get_value (error_code &ec = throws) const
 Retrieve the ‘real’ value of the counter_value, converted to the requested type T.
```

#### **Public Members**

*std::uint64\_t time\_*  
The local time when data was collected.

*std::uint64\_t count\_*  
The invocation counter for the data.

*std::int64\_t value\_*  
The current counter value.

*std::int64\_t scaling\_*  
The scaling of the current counter value.

*counter\_status status\_*  
The status of the counter value.

*bool scale\_inverse\_*  
If true, *value\_* needs to be divided by *scaling\_*, otherwise it has to be multiplied.

#### **Private Functions**

```
void serialize (serialization::output_archive &ar, const unsigned int)
```

```
void serialize (serialization::input_archive &ar, const unsigned int)
```

#### **Friends**

```
friend hpx::performance_counters::hpx::serialization::access
struct counter_values_array
```

## Public Functions

```
counter_values_array (std::int64_t scaling = 1, bool scale_inverse = false)
counter_values_array (std::vector<std::int64_t> &&values, std::int64_t scaling = 1, bool
scale_inverse = false)
counter_values_array (std::vector<std::int64_t> const &values, std::int64_t scaling =
1, bool scale_inverse = false)

template<typename T>
T get_value (std::size_t index, error_code &ec = throws) const
 Retrieve the ‘real’ value of the counter_value, converted to the requested type T.
```

## Public Members

```
std::uint64_t time_
 The local time when data was collected.

std::uint64_t count_
 The invocation counter for the data.

std::vector<std::int64_t> values_
 The current counter values.

std::int64_t scaling_
 The scaling of the current counter values.

counter_status status_
 The status of the counter value.

bool scale_inverse_
 If true, value_ needs to be divided by scaling_, otherwise it has to be multiplied.
```

## Private Functions

```
void serialize (serialization::output_archive &ar, const unsigned int)
void serialize (serialization::input_archive &ar, const unsigned int)
```

## Friends

```
friend hpx::performance_counters::hpx::serialization::access
namespace hpx

namespace agas
```

## Functions

```
void locality_namespace_register_counter_types(error_code &ec = throws)
namespace hpx
```

```
namespace performance_counters
```

## Functions

```
void install_counter(naming::id_type const &id, counter_info const &info, error_code
&ec = throws)
```

Install a new performance counter in a way, which will uninstall it automatically during shutdown.

```
namespace hpx
```

```
namespace performance_counters
```

## Functions

```
counter_status install_counter_type(std::string const &name,
hpX::util::function_nonser<std::int64_t> bool
> const &counter_value, std::string const &helptext = "", std::string const &uom = "",
counter_type type = counter_raw, error_code &ec = throws) Install a new generic performance counter
type in a way, which will uninstall it automatically during shutdown.
```

The function *install\_counter\_type* will register a new generic counter type based on the provided function. The counter type will be automatically unregistered during system shutdown. Any consumer querying any instance of this counter type will cause the provided function to be called and the returned value to be exposed as the counter value.

The counter type is registered such that there can be one counter instance per locality. The expected naming scheme for the counter instances is: '/objectname{locality#<\*>/total}/countername' where '<\*>' is a zero based integer identifying the locality the counter is created on.

**Note** As long as *ec* is not pre-initialized to *hpX::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpX::exception*.

**Return** If successful, this function returns *status\_valid\_data*, otherwise it will either throw an exception or return an *error\_code* from the enum *counter\_status* (also, see note related to parameter *ec*).

**Note** The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

### Parameters

- *name*: [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- *counter\_value*: [in] The function to call whenever the counter value is requested by a consumer.
- *helptext*: [in, optional] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- *uom*: [in] The unit of measure for the new performance counter type.
- *type*: [in] Type for the new performance counter type.

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
counter_status install_counter_type(std::string const &name,
 hpx::util::function_nonser<std::vector<std::int64_t>> bool
> const &counter_value, std::string const &helptext = "", std::string const &uom = "",
error_code &ec = throwsInstall a new generic performance counter type returning an array of values in
a way, that will uninstall it automatically during shutdown.
```

The function `install_counter_type` will register a new generic counter type that returns an array of values based on the provided function. The counter type will be automatically unregistered during system shutdown. Any consumer querying any instance of this counter type will cause the provided function to be called and the returned array value to be exposed as the counter value.

The counter type is registered such that there can be one counter instance per locality. The expected naming scheme for the counter instances is: '/objectname{locality#<\*>}/total'/countername' where '<\*>' is a zero based integer identifying the locality the counter is created on.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Return** If successful, this function returns `status_valid_data`, otherwise it will either throw an exception or return an `error_code` from the enum `counter_status` (also, see note related to parameter `ec`).

**Note** The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

#### Parameters

- `name`: [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- `counter_value`: [in] The function to call whenever the counter value (array of values) is requested by a consumer.
- `helptext`: [in, optional] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- `uom`: [in] The unit of measure for the new performance counter type.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
void install_counter_type(std::string const &name, counter_type type, error_code &ec =
 throws)
```

Install a new performance counter type in a way, which will uninstall it automatically during shutdown.

The function `install_counter_type` will register a new counter type based on the provided `counter_type_info`. The counter type will be automatically unregistered during system shutdown.

**Return** If successful, this function returns `status_valid_data`, otherwise it will either throw an exception or return an `error_code` from the enum `counter_status` (also, see note related to parameter `ec`).

**Note** The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `name`: [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.

- `type`: [in] The type of the counters of this counter\_type.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
counter_status install_counter_type (std::string const &name, counter_type
 type, std::string const &helptext, std::string
 const &uom = "", std::uint32_t version =
 HPX_PERFORMANCE_COUNTER_V1, error_
 code &ec = throws)
```

Install a new performance counter type in a way, which will uninstall it automatically during shutdown.

The function `install_counter_type` will register a new counter type based on the provided `counter_type_info`. The counter type will be automatically unregistered during system shutdown.

**Return** If successful, this function returns `status_valid_data`, otherwise it will either throw an exception or return an `error_code` from the enum `counter_status` (also, see note related to parameter `ec`).

**Note** The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

#### Parameters

- `name`: [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- `type`: [in] The type of the counters of this counter\_type.
- `helptext`: [in] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- `uom`: [in] The unit of measure for the new performance counter type.
- `version`: [in] The version of the counter type. This is currently expected to be set to `HPX_PERFORMANCE_COUNTER_V1`.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
counter_status install_counter_type (std::string const &name, counter_type type,
 std::string const &helptext, create_counter_func
 const &create_counter, discover_counters_func
 const &discover_counters, std::uint32_t version =
 HPX_PERFORMANCE_COUNTER_V1, std::string
 const &uom = "", error_code &ec = throws)
```

Install a new generic performance counter type in a way, which will uninstall it automatically during shutdown.

The function `install_counter_type` will register a new generic counter type based on the provided `counter_type_info`. The counter type will be automatically unregistered during system shutdown.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Return** If successful, this function returns `status_valid_data`, otherwise it will either throw an exception or return an `error_code` from the enum `counter_status` (also, see note related to parameter `ec`).

**Note** The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

#### Parameters

- name: [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- type: [in] The type of the counters of this counter\_type.
- helptext: [in] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- version: [in] The version of the counter type. This is currently expected to be set to HPX\_PERFORMANCE\_COUNTER\_V1.
- create\_counter: [in] The function which will be called to create a new instance of this counter type.
- discover\_counters: [in] The function will be called to discover counter instances which can be created.
- uom: [in] The unit of measure of the counter type (default: "")
- ec: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```

Add a new performance counter type to the (local) registry.

```
counter_status discover_counter_types(discover_counter_func discover_counter, discover_counters_mode mode, error_code &ec =
 throws)
```

Call the supplied function for all registered counter types.

```
counter_status discover_counter_type (std::string const &fullname, discover_counter_func discover_counter, discover_counters_mode mode, error_code &ec = throws)
```

Call the supplied function for the given registered counter type.

```
counter_status discover_counter_type (counter_info const &info, discover_counter_func const &f, discover_counters_mode mode, error_code &ec = throws)
```

```
counter_status get_counter_create_function (counter_info const &info, create_counter_func &create_counter, error_code &ec = throws) const
```

Retrieve the counter creation function which is associated with a given counter type.

```
counter_status get_counter_discovery_function (counter_info const &info, discover_counters_func &func, error_code &ec) const
```

Retrieve the counter discovery function which is associated with a given counter type.

```
counter_status remove_counter_type (counter_info const &info, error_code &ec = throws)
```

Remove an existing counter type from the (local) registry.

**Note** This doesn't remove existing counters of this type, it just inhibits defining new counters using this type.

```
counter_status create_raw_counter_value (counter_info const &info, std::int64_t *countervalue, naming::gid_type &id, error_code &ec = throws)
```

Create a new performance counter instance of type raw\_counter based on given counter value.

```
counter_status create_raw_counter (counter_info const &info, hpx::util::function_nonser<std::int64_t> > const &fnaming::gid_type &id, error_code &ec = throws) Create a new performance counter instance of type raw_counter based on given function returning the counter value.
```

```
counter_status create_raw_counter (counter_info const &info, hpx::util::function_nonser<std::int64_t> > const &f, naming::gid_type &id, error_code &ec = throws) Create a new performance counter instance of type raw_counter based on given function returning the counter value.
```

```
counter_status create_raw_counter (counter_info const &info, hpx::util::function_nonser<std::vector<std::int64_t>> > const &fnaming::gid_type &id, error_code &ec = throws) Create a new performance counter instance of type raw_counter based on given function returning the counter value.
```

```
counter_status create_raw_counter (counter_info const &info, hpx::util::function_nonser<std::vector<std::int64_t>> > const &f, naming::gid_type &id, error_code &ec = throws) Create a new performance counter instance of type raw_counter based on given function returning the counter value.
```

```
counter_status create_counter (counter_info const &info, naming::gid_type &id, error_code &ec = throws)
```

Create a new performance counter instance based on given counter info.

```
counter_status create_statistics_counter(counter_info const &info, std::string
const &base_counter_name,
std::vector<std::size_t> const ¶meters, naming::gid_type &id, error_code
&ec = throws)
```

Create a new statistics performance counter instance based on given base counter name and given base time interval (milliseconds).

```
counter_status create_arithmetics_counter(counter_info const &info,
std::vector<std::string> const &base_counter_names,
naming::gid_type &id, error_code &ec
= throws)
```

Create a new arithmetics performance counter instance based on given base counter names.

```
counter_status create_arithmetics_counter_extended(counter_info
const &info,
std::vector<std::string>
const
&base_counter_names,
naming::gid_type &id,
error_code &ec = throws)
```

Create a new extended arithmetics performance counter instance based on given base counter names.

```
counter_status add_counter(naming::id_type const &id, counter_info const &info, error_code &ec = throws)
```

Add an existing performance counter instance to the registry.

```
counter_status remove_counter(counter_info const &info, naming::id_type const &id,
error_code &ec = throws)
```

remove the existing performance counter from the registry

```
counter_status get_counter_type(std::string const &name, counter_info &info, error_code &ec = throws)
```

Retrieve counter type information for given counter name.

## Public Static Functions

The contents of this module can be included with the header `hpx/modules/runtime_components.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/runtime_components.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX* API.

### Defines

#### `HPX_REGISTER_COMPONENT` (*type, name, mode*)

Define a component factory for a component type.

This macro is used create and to register a minimal component factory for a component type which allows it to be remotely created using the `hpx::new_<>` function.

This macro can be invoked with one, two or three arguments

### Parameters

- *type*: The *type* parameter is a (fully decorated) type of the component type for which a factory should be defined.
- *name*: The *name* parameter specifies the name to use to register the factory. This should uniquely (system-wide) identify the component type. The *name* parameter must conform to the C++ identifier rules (without any namespace). If this parameter is not given, the first parameter is used.
- *mode*: The *mode* parameter has to be one of the defined enumeration values of the enumeration `hpx::components::factory_state_enum`. The default for this parameter is `hpx::components::factory_enabled`.

### Defines

#### `HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY` (...)

This macro is used create and to register a minimal component registry with `Hpx.Plugin`.

#### `HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_` (...)

#### `HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_2` (*ComponentType, componentname*)

#### `HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_3` (*ComponentType, componentname, state*)

#### `HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_DYNAMIC` (...)

#### `HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_DYNAMIC_` (...)

#### `HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_DYNAMIC_2` (*ComponentType, componentname*)

#### `HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_DYNAMIC_3` (*ComponentType, componentname, state*)

`namespace hpx`

`namespace components`

`template<typename Component, factory_state_enum state>`

```
struct component_registry : public component_registry_base
```

#include <component\_registry.hpp> The component\_registry provides a minimal implementation of a component's registry. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a component's registry instance.

### Template Parameters

- Component: The component type this registry should be responsible for.

### Public Functions

```
bool get_component_info(std::vector<std::string> &fillini, std::string const &filepath,
```

    bool is\_static = false)

Return the ini-information for all contained components.

**Return** Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

#### Parameters

- *fillini*: [in] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.

```
void register_component_type()
```

Return the unique identifier of the component type this factory is responsible for.

**Return** Returns the unique identifier of the component type this factory instance is responsible for. This function throws on any error.

#### Parameters

- *locality*: [in] The id of the locality this factory is responsible for.
- *agas\_client*: [in] The AGAS client to use for component id registration (if needed).

```
namespace hpx
```

### Functions

```
components::server::runtime_support *get_runtime_support()
```

```
namespace hpx
```

```
namespace components
```

### Functions

```
void console_error_sink(naming::id_type const &dst, std::exception_ptr const &e)
```

```
void console_error_sink(std::exception_ptr const &e)
```

```
namespace hpx
```

```
namespace components
```

## Functions

```
void console_logging(logging_destination dest, std::size_t level, std::string const &msg)
void cleanup_logging()
void activate_logging()

namespace hpx

namespace components
```

## Functions

```
template<typename Component, typename ...Ts>
future<naming::id_type> create_async(naming::id_type const &gid, Ts&&... vs)
 Asynchronously create a new instance of a component.

template<typename Component, typename ...Ts>
future<std::vector<naming::id_type>> bulk_create_async(naming::id_type const &gid,
 std::size_t count, Ts&&... vs)

template<typename Component, typename ...Ts>
naming::id_type create(naming::id_type const &gid, Ts&&... vs)

template<typename Component, typename ...Ts>
std::vector<naming::id_type> bulk_create(naming::id_type const &gid, std::size_t count,

 const
 &gid,
 std::size_t
 count,
 Ts&&...
 vs)

template<typename Component, typename ...Ts>
std::vector<naming::id_type> bulk_create_colocated(naming::id_type const &id,
 std::size_t count, Ts&&... vs)

namespace hpx

namespace components
```

## Variables

```
const default_distribution_policy default_layout = {}
```

A predefined instance of the default *distribution\_policy*. It will represent the local locality and will place all items to create here.

```
struct default_distribution_policy
```

#include <default\_distribution\_policy.hpp> This class specifies the parameters for a simple distribution policy to use for creating (and evenly distributing) a given number of items on a given set of localities.

## Public Functions

```
constexpr default_distribution_policy()
```

Default-construct a new instance of a *default\_distribution\_policy*. This policy will represent one locality (the local locality).

```
default_distribution_policy operator()(std::vector<id_type> const &locs) const
```

Create a new *default\_distribution* policy representing the given set of localities.

### Parameters

- *locs*: [in] The list of localities the new instance should represent

```
default_distribution_policy operator()(std::vector<id_type> &&locs) const
```

Create a new *default\_distribution* policy representing the given set of localities.

### Parameters

- *loc*: [in] The list of localities the new instance should represent

```
default_distribution_policy operator()(id_type const &loc) const
```

Create a new *default\_distribution* policy representing the given locality

### Parameters

- *loc*: [in] The locality the new instance should represent

```
template<typename Component, typename ...Ts>
```

```
hpx::future<hpx::id_type> create(Ts&&... vs) const
```

Create one object on one of the localities associated by this policy instance

**Note** This function is part of the placement policy implemented by this class

**Return** A future holding the global address which represents the newly created object

### Parameters

- *vs*: [in] The arguments which will be forwarded to the constructor of the new object.

```
template<typename Component, typename ...Ts>
```

```
hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs)
```

const

Create multiple objects on the localities associated by this policy instance

**Note** This function is part of the placement policy implemented by this class

**Return** A future holding the list of global addresses which represent the newly created objects

### Parameters

- `count`: [in] The number of objects to create
- `vs`: [in] The arguments which will be forwarded to the constructors of the new objects.

```
template<typename Action, typename ...Ts>
async_result<Action>::type async (launch policy, Ts&&... vs) const

template<typename Action, typename Callback, typename ...Ts>
async_result<Action>::type async_cb (launch policy, Callback &&cb, Ts&&... vs) const
```

**Note** This function is part of the invocation policy implemented by this class

```
template<typename Action, typename Continuation, typename ...Ts>
bool apply (Continuation &&c, threads::thread_priority priority, Ts&&... vs) const

Note This function is part of the invocation policy implemented by this class
```

```
template<typename Action, typename ...Ts>
bool apply (threads::thread_priority priority, Ts&&... vs) const
```

```
template<typename Action, typename Continuation, typename Callback, typename ...Ts>
bool apply_cb (Continuation &&c, threads::thread_priority priority, Callback &&cb, Ts&&... vs) const
```

**Note** This function is part of the invocation policy implemented by this class

```
template<typename Action, typename Callback, typename ...Ts>
bool apply_cb (threads::thread_priority priority, Callback &&cb, Ts&&... vs) const
```

```
std::size_t get_num_localities () const
```

Returns the number of associated localities for this distribution policy

**Note** This function is part of the creation policy implemented by this class

```
hpx::id_type get_next_target () const
```

Returns the locality which is anticipated to be used for the next async operation

```
template<typename Action>
struct async_result
#include <default_distribution_policy.hpp>
```

**Note** This function is part of the invocation policy implemented by this class

## Functions

**template<typename Component, typename... Ts><unspecified> hpx::new\_(id\_type const & loc)**

Create one or more new instances of the given Component type on the specified locality.

This function creates one or more new instances of the given Component type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

**Note** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =
 hpx::new_<some_component>(hpx::find_here(), ...);
hpx::id_type id = f.get();
```

**Return** The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument *Component* represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

## Parameters

- `locality`: [in] The global address of the locality where the new instance should be created on.
- `vs`: [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

**template<typename Component, typename... Ts><unspecified> hpx::local\_new(Ts &&... vs)**

Create one new instance of the given Component type on the current locality.

This function creates one new instance of the given Component type on the current locality and returns a future object for the global address which can be used to reference the new component instance.

**Note** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =
 hpx::local_new<some_component>(...);
hpx::id_type id = f.get();
```

**Return** The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function

will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component. If the first argument is `hpx::launch::sync` the function will directly return an `hpx::id_type`.

- If the explicit template argument `Component` represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

**Note** The difference of this function to `hpx::new_` is that it can be used in cases where the supplied arguments are non-copyable and non-movable. All operations are guaranteed to be local only.

#### Parameters

- `vs`: [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

```
template<typename Component, typename... Ts><unspecified> hpx::new_(id_type const & locality, int count, Ts... vs)
```

Create multiple new instances of the given Component type on the specified locality.

This function creates multiple new instances of the given Component type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

**Note** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<std::vector<hpx::id_type> > f =
 hpx::new_<some_component[]>(hpx::find_here(), 10, ...);
hpx::id_type id = f.get();
```

**Return** The function returns different types depending on its use:

- If the explicit template argument `Component` represents an array of a component type (i.e. `Component[]`, where `traits::is_component<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which holds a `std::vector<hpx::id_type>`, where each of the items in this vector is a global address of one of the newly created components.
- If the explicit template argument `Component` represents an array of a client side object type (i.e. `Component[]`, where `traits::is_client<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which holds a `std::vector<hpx::id_type>`, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

#### Parameters

- `locality`: [in] The global address of the locality where the new instance should be created on.
- `count`: [in] The number of component instances to create
- `vs`: [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

```
template<typename Component, typename DistPolicy, typename... Ts><unspecified> hpx::new_(id_type const & locality, int count, Ts... vs)
```

Create one or more new instances of the given Component type based on the given distribution policy.

This function creates one or more new instances of the given Component type on the localities defined by the given distribution policy and returns a future object for global address which can be used to reference the new component instance(s).

**Note** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =
 hpx::new_<some_component>(hpx::default_layout, ...);
hpx::id_type id = f.get();
```

**Return** The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument *Component* represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

#### Parameters

- `policy`: [in] The distribution policy used to decide where to place the newly created.
- `vs`: [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

**template<typename Component, typename DistPolicy, typename... Ts><unspecified> hpx::new\_<some\_component>(DistPolicy policy, Ts... vs)**

Create multiple new instances of the given Component type on the localities as defined by the given distribution policy.

This function creates multiple new instances of the given Component type on the localities defined by the given distribution policy and returns a future object for the global address which can be used to reference the new component instance.

**Note** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<std::vector<hpx::id_type>> f =
 hpx::new_<some_component[]>(hpx::default_layout, 10, ...);
hpx::id_type id = f.get();
```

**Return** The function returns different types depending on its use:

- If the explicit template argument *Component* represents an array of a component type (i.e. `Component[]`, where `traits::is_component<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which holds a `std::vector<hpx::id_type>`, where each of the items in this vector is a global address of one of the newly created components.
- If the explicit template argument *Component* represents an array of a client side object type (i.e. `Component[]`, where `traits::is_client<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which holds a `std::vector<hpx::id_type>`, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

#### Parameters

- `policy`: [in] The distribution policy used to decide where to place the newly created.
- `count`: [in] The number of component instances to create

- `vs`: [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

## runtime\_distributed

The contents of this module can be included with the header `hpx/modules/runtime_distributed.hpp`. These headers may be used by user-code but are not guaranteed stable (neither header location nor contents). You are using these at your own risk. If you wish to use non-public functionality from a module we *strongly* suggest only including the module header `hpx/modules/runtime_distributed.hpp`, not the particular header in which the functionality you would like to use is defined. See *Public API* for a list of names that are part of the public *HPX* API.

```
namespace hpx
```

```
class runtime_distributed : public runtime
 #include <runtime_distributed.hpp> The runtime class encapsulates the HPX runtime system in a simple
 to use way. It makes sure all required parts of the HPX runtime system are properly initialized.
```

## Public Functions

```
hpx::runtime_distributed::runtime_distributed(util::runtime_configuration & rtcfg,
 Construct a new HPX runtime instance
```

### Parameters

- `locality_mode`: [in] This is the mode the given runtime instance should be executed in.

```
~runtime_distributed()
```

The destructor makes sure all HPX runtime services are properly shut down before exiting.

```
int start (util::function_nonser<hpx_main_function_type> const &func, bool blocking = false)
 Start the runtime system.
```

**Return** If a `blocking` is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise it will return zero.

### Parameters

- `func`: [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the `typedef hpx_main_function_type`.
- `blocking`: [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function `runtime::start` will call `runtime::wait` internally.

```
int start (bool blocking = false)
 Start the runtime system.
```

**Return** If a `blocking` is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise it will return zero.

### Parameters

- **blocking:** [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function `runtime::start` will call `runtime::wait` internally .

**int `wait` ()**  
Wait for the shutdown action to be executed.

**Return** This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

**void `stop` (bool `blocking` = true)**  
Initiate termination of the runtime system.

#### Parameters

- **blocking:** [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

**int `finalize` (double `shutdown_timeout`)**

**void `stop_helper` (bool `blocking`, std::condition\_variable &`cond`, std::mutex &`mtx`)**  
Stop the runtime system, wait for termination.

#### Parameters

- **blocking:** [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

**int `suspend` ()**  
Suspend the runtime system.

**int `resume` ()**  
Resume the runtime system.

**bool `report_error` (std::size\_t `num_thread`, std::exception\_ptr `const &e`, bool `terminate_all` = true)**  
Report a non-recoverable error to the runtime system.

#### Parameters

- **num\_thread:** [in] The number of the operating system thread the error has been detected in.
- **e:** [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate\_all:** [in] Kill all localities attached to the currently running application (default: true)

**bool `report_error` (std::exception\_ptr `const &e`, bool `terminate_all` = true)**  
Report a non-recoverable error to the runtime system.

**Note** This function will retrieve the number of the current shepherd thread and forward to the `report_error` function above.

#### Parameters

- **e:** [in] This is an instance encapsulating an exception which lead to this function call.

- `terminate_all`: [in] Kill all localities attached to the currently running application (default: true)

```
int run (util::function_nonser<hpx_main_function_type> const &func)
```

Run the HPX runtime system, use the given function for the main *thread* and block waiting for all threads to finish.

**Note** The parameter *func* is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

**Return** This function will return the value as returned as the result of the invocation of the function object given by the parameter *func*.

#### Parameters

- *func*: [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx\_main\_function\_type*. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

```
int run ()
```

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

**Return** This function will always return 0 (zero).

```
bool is_networking_enabled ()
```

```
template<typename F>
```

```
components::server::console_error_dispatcher::sink_type set_error_sink (F &&sink)
```

```
performance_counters::registry &get_counter_registry ()
```

Allow access to the registry counter registry instance used by the HPX runtime.

```
performance_counters::registry const &get_counter_registry () const
```

Allow access to the registry counter registry instance used by the HPX runtime.

```
void register_counter_types ()
```

Install all performance counters related to this runtime instance.

```
void register_query_counters (std::shared_ptr<util::query_counters> const &active_counters)
```

```
void start_active_counters (error_code &ec = throws)
```

```
void stop_active_counters (error_code &ec = throws)
```

```
void reset_active_counters (error_code &ec = throws)
```

```
void reinit_active_counters (bool reset = true, error_code &ec = throws)
```

```
void evaluate_active_counters (bool reset = false, char const *description = nullptr, error_code &ec = throws)
```

```
void stop_evaluating_counters (bool terminate = false)
```

```
naming::resolver_client &get_agas_client ()
```

Allow access to the AGAS client instance used by the HPX runtime.

---

**`hpx::threads::threadmanager &get_thread_manager()`**  
Allow access to the thread manager instance used by the HPX runtime.

**`applier::applier &get_applier()`**  
Allow access to the applier instance used by the HPX runtime.

**`std::string here() const`**  
Returns a string of the locality endpoints (usable in debug output)

**`std::uint64_t get_runtime_support_lva() const`**

**`naming::gid_type get_next_id(std::size_t count = 1)`**

**`void init_id_pool_range()`**

**`util::unique_id_ranges &get_id_pool()`**

**`void initialize_agas()`**

Initialize AGAS operation.

**`void add_pre_startup_function(startup_function_type f)`**

Add a function to be executed inside a HPX thread before `hpx_main` but guaranteed to be executed before any startup function registered with `add_startup_function`.

**Note** The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

#### Parameters

- `f`: The function ‘`f`’ will be called from inside a HPX thread before `hpx_main` is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

**`void add_startup_function(startup_function_type f)`**

Add a function to be executed inside a HPX thread before `hpx_main`

#### Parameters

- `f`: The function ‘`f`’ will be called from inside a HPX thread before `hpx_main` is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

**`void add_pre_shutdown_function(shutdown_function_type f)`**

Add a function to be executed inside a HPX thread during `hpx::finalize`, but guaranteed before any of the shutdown functions is executed.

**Note** The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

#### Parameters

- `f`: The function ‘`f`’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

**`void add_shutdown_function(shutdown_function_type f)`**

Add a function to be executed inside a HPX thread during `hpx::finalize`

#### Parameters

- `f`: The function ‘`f`’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

`hpx::util::io_service_pool *get_thread_pool (char const *name)`

Access one of the internal thread pools (io\_service instances) HPX is using to perform specific tasks. The three possible values for the argument `name` are “main\_pool”, “io\_pool”, “parcel\_pool”, and “timer\_pool”. For any other argument value the function will return zero.

`bool register_thread (char const *name, std::size_t num = 0, bool service_thread = true, error_code &ec = throws)`

Register an external OS-thread with HPX.

`notification_policy_type get_notification_policy (char const *prefix, runtime_local::os_thread_type type)`

Generate a new notification policy instance for the given thread name prefix

`std::uint32_t get_locality_id (error_code &ec) const`

`std::size_t get_num_worker_threads () const`

`std::uint32_t get_num_localities (hpx::launch::sync_policy, error_code &ec) const`

`std::uint32_t get_initial_num_localities () const`

`lcos::future<std::uint32_t> get_num_localities () const`

`std::string get_locality_name () const`

`std::uint32_t get_num_localities (hpx::launch::sync_policy, components::component_type type, error_code &ec) const`

`lcos::future<std::uint32_t> get_num_localities (components::component_type type) const`

`std::uint32_t assign_cores (std::string const &locality_basename, std::uint32_t num_threads)`

`std::uint32_t assign_cores ()`

## Private Types

`using used_cores_map_type = std::map<std::string, std::uint32_t>`

## Private Static Functions

```
static void default_errorsink(std::string const&)

namespace hpx

namespace applier

class applier

#include <applier.hpp> The applier class is used to decide whether a particular action has to be issued on a local or a remote resource. If the target component is local a new thread will be created, if the target is remote a parcel will be sent.
```

## Public Functions

```
HPX_NON_COPYABLE(applier)

applier()

void init(threads::threadmanager &tm)

~applier()

void initialize(std::uint64_t rts)

threads::threadmanager &get_thread_manager()

Access the thread-manager instance associated with this applier.
```

This function returns a reference to the thread manager this applier instance has been created with.

```
naming::gid_type const &get_raw_locality(error_code &ec = throws) const

Allow access to the locality of the locality this applier instance is associated with.
```

This function returns a reference to the locality this applier instance is associated with.

```
std::uint32_t get_locality_id(error_code &ec = throws) const
```

Allow access to the id of the locality this applier instance is associated with.

This function returns a reference to the id of the locality this applier instance is associated with.

```
bool get_raw_remote_localities(std::vector<naming::gid_type> &locality_ids,
 components::component_type type = components::component_invalid,
 error_code &ec = throws) const
```

Return list of localities of all remote localities registered with the AGAS service for a specific component type.

This function returns a list of all remote localities (all localities known to AGAS except the local one) supporting the given component type.

**Return** The function returns *true* if there is at least one remote locality known to the AGASService (!prefixes.empty()).

#### Parameters

- locality\_ids: [out] The reference to a vector of id\_types filled by the function.
- type: [in] The type of the component which needs to exist on the returned localities.

```
bool get_remote_localities(std::vector<naming::id_type> &locality_ids,
 components::component_type type = components::component_invalid,
 error_code &ec = throws) const
```

```
bool get_raw_localities(std::vector<naming::gid_type> &locality_ids,
 components::component_type type = components::component_invalid) const
```

Return list of locality\_ids of all localities registered with the AGAS service for a specific component type.

This function returns a list of all localities (all localities known to AGAS except the local one) supporting the given component type.

**Return** The function returns *true* if there is at least one remote locality known to the AGASService (!prefixes.empty()).

#### Parameters

- locality\_ids: [out] The reference to a vector of id\_types filled by the function.
- type: [in] The type of the component which needs to exist on the returned localities.

```
bool get_localities(std::vector<naming::id_type> &locality_ids, error_code &ec = throws) const
```

```
bool get_localities(std::vector<naming::id_type> &locality_ids, components::component_type type, error_code &ec = throws) const
```

*naming::gid\_type const &get\_runtime\_support\_raw\_gid() const*

By convention the runtime\_support has a gid identical to the prefix of the locality the runtime\_support is responsible for

*naming::id\_type const &get\_runtime\_support\_gid() const*

By convention the runtime\_support has a gid identical to the prefix of the locality the runtime\_support is responsible for

## Private Members

```
threads::threadmanager *thread_manager_
naming::id_type runtime_support_id_
namespace hpx

namespace applier
```

## Functions

`applier &get_applier()`

The function `get_applier` returns a reference to the (thread specific) applier instance.

`applier *get_applier_ptr()`

The function `get_applier` returns a pointer to the (thread specific) applier instance. The returned pointer is NULL if the current thread is not known to HPX or if the runtime system is not active.

## namespace applier

The namespace `applier` contains all definitions needed for the class `hpx::applier::applier` and its related functionality. This namespace is part of the HPX core module.

## namespace hpx

## namespace components

## Functions

`template<typename Component>`

`future<naming::id_type> copy(naming::id_type const &to_copy)`

Copy given component to the specified target locality.

The function `copy<Component>` will create a copy of the component referenced by `to_copy` on the locality specified with `target_locality`. It returns a future referring to the newly created component instance.

**Return** A future representing the global id of the newly (copied) component instance.

**Note** The new component instance is created on the locality of the component instance which is to be copied.

### Parameters

- `to_copy`: [in] The global id of the component to copy

### Template Parameters

- The: only template argument specifies the component type to create.

`template<typename Component>`

`future<naming::id_type> copy(naming::id_type const &to_copy, naming::id_type const &target_locality)`

Copy given component to the specified target locality.

The function `copy<Component>` will create a copy of the component referenced by `to_copy` on the locality specified with `target_locality`. It returns a future referring to the newly created component instance.

**Return** A future representing the global id of the newly (copied) component instance.

**Parameters**

- `to_copy`: [in] The global id of the component to copy
- `target_locality`: [in ] The locality where the copy should be created.

**Template Parameters**

- The: only template argument specifies the component type to create.

```
template<typename Derived, typename Stub>
Derived copy(client_base<Derived, Stub> const &to_copy, naming::id_type const &target_locality = naming::invalid_id)
```

Copy given component to the specified target locality.

The function `copy` will create a copy of the component referenced by the client side object `to_copy` on the locality specified with `target_locality`. It returns a new client side object future referring to the newly created component instance.

**Return** A future representing the global id of the newly (copied) component instance.

**Note** If the second argument is omitted (or is `invalid_id`) the new component instance is created on the locality of the component instance which is to be copied.

**Parameters**

- `to_copy`: [in] The client side object representing the component to copy
- `target_locality`: [in, optional] The locality where the copy should be created (default is same locality as source).

**Template Parameters**

- The: only template argument specifies the component type to create.

```
namespace hpx
```

## Functions

```
naming::id_type find_root_locality(error_code &ec = throws)
```

Return the global id representing the root locality.

The function `find_root_locality()` can be used to retrieve the global id usable to refer to the root locality. The root locality is the locality where the main AGAS service is hosted.

**Note** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

**Return** The global id representing the root locality for this application.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note** This function will return meaningful results only if called from an HPX-thread. It will return `hpx::naming::invalid_id` otherwise.

**See** `hpx::find_all_localities()`, `hpx::find_locality()`

**Parameters**

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
std::vector<naming::id_type> find_all_localities(error_code &ec = throws)
```

Return the list of global ids representing all localities available to this application.

The function `find_all_localities()` can be used to retrieve the global ids of all localities currently available to this application.

**Note** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

**Return** The global ids representing the localities currently available to this application.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note** This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

**See** `hpx::find_here()`, `hpx::find_locality()`

#### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`std::vector<naming::id_type> find_remote_localities(error_code &ec = throws)`

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function `find_remote_localities()` can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one).

**Note** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

**Return** The global ids representing the remote localities currently available to this application.

**Note** As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

**Note** This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

**See** `hpx::find_here()`, `hpx::find_locality()`

#### Parameters

- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`namespace hpx`

## Functions

`naming::id_type find_here(error_code &ec = throws)`

Return the global id representing this locality.

The function `find_here()` can be used to retrieve the global id usable to refer to the current locality.

**Note** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

**Return** The global id representing the locality this function has been called on.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Note** This function will return meaningful results only if called from an HPX-thread. It will return *hpx::naming::invalid\_id* otherwise.

**See** `hpx::find_all_localities()`, `hpx::find_locality()`

#### Parameters

- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**namespace hpx**

## Functions

*std::vector<naming::id\_type> find\_all\_localities(components::component\_type type, error\_code &ec = throws)*

Return the list of global ids representing all localities available to this application which support the given component type.

The function `find_all_localities()` can be used to retrieve the global ids of all localities currently available to this application which support the creation of instances of the given component type.

**Note** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

**Return** The global ids representing the localities currently available to this application which support the creation of instances of the given component type. If no localities supporting the given component type are currently available, this function will return an empty vector.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Note** This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

**See** `hpx::find_here()`, `hpx::find_locality()`

#### Parameters

- *type*: [in] The type of the components for which the function should return the available localities.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

*std::vector<naming::id\_type> find\_remote\_localities(components::component\_type type, error\_code &ec = throws)*

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function `find_remote_localities()` can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one) which support the creation of instances of the given component type.

**Note** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

**Return** The global ids representing the remote localities currently available to this application.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Note** This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

**See** `hpx::find_here()`, `hpx::find_locality()`

#### Parameters

- *type*: [in] The type of the components for which the function should return the available remote localities.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

*naming::id\_type find\_locality(components::component\_type type, error\_code &ec = throws)*

Return the global id representing an arbitrary locality which supports the given component type.

The function `find_locality()` can be used to retrieve the global id of an arbitrary locality currently available to this application which supports the creation of instances of the given component type.

**Note** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

**Return** The global id representing an arbitrary locality currently available to this application which supports the creation of instances of the given component type. If no locality supporting the given component type is currently available, this function will return *hpx::naming::invalid\_id*.

**Note** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Note** This function will return meaningful results only if called from an HPX-thread. It will return *hpx::naming::invalid\_id* otherwise.

**See** `hpx::find_here()`, `hpx::find_all_localities()`

#### Parameters

- *type*: [in] The type of the components for which the function should return any available locality.
- *ec*: [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**namespace hpx**

## Functions

```
future<std::string> get_locality_name (naming::id_type const &id)
```

Return the name of the referenced locality.

This function returns a future referring to the name for the locality of the given id.

**Return** This function returns the name for the locality of the given id. The name is retrieved from the underlying networking layer and may be different for different parcel ports.

**See** `std::string get_locality_name()`

### Parameters

- `id`: [in] The global id of the locality for which the name should be retrieved

```
namespace hpx
```

## Functions

```
lcos::future<std::uint32_t> get_num_localities (components::component_type t)
```

Asynchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` asynchronously returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

**Note** This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

**See** `hpx::find_all_localities, hpx::get_num_localities`

### Parameters

- `t`: The component type for which the number of connected localities should be retrieved.

```
std::uint32_t get_num_localities (launch::sync_policy, components::component_type t, error_code &ec = throws)
```

Synchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

**Note** This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

**See** `hpx::find_all_localities, hpx::get_num_localities`

### Parameters

- `t`: The component type for which the number of connected localities should be retrieved.
- `ec`: [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
namespace hpx
```

**namespace components****Functions**

```
template<typename Component, typename DistPolicy>
future<naming::id_type> migrate(naming::id_type const &to_migrate, DistPolicy const &policy)
```

Migrate the given component to the specified target locality

The function *migrate*<Component> will migrate the component referenced by *to\_migrate* to the locality specified with *target\_locality*. It returns a future referring to the migrated component instance.

**Return** A future representing the global id of the migrated component instance. This should be the same as *migrate\_to*.

**Parameters**

- *to\_migrate*: [in] The client side representation of the component to migrate.
- *policy*: [in] A distribution policy which will be used to determine the locality to migrate this object to.

**Template Parameters**

- *Component*: Specifies the component type of the component to migrate.
- *DistPolicy*: Specifies the distribution policy to use to determine the destination locality.

```
template<typename Derived, typename Stub, typename DistPolicy>
Derived migrate(client_base<Derived, Stub> const &to_migrate, DistPolicy const &policy)
```

Migrate the given component to the specified target locality

The function *migrate*<Component> will migrate the component referenced by *to\_migrate* to the locality specified with *target\_locality*. It returns a future referring to the migrated component instance.

**Return** A future representing the global id of the migrated component instance. This should be the same as *migrate\_to*.

**Parameters**

- *to\_migrate*: [in] The client side representation of the component to migrate.
- *policy*: [in] A distribution policy which will be used to determine the locality to migrate this object to.

**Template Parameters**

- *Derived*: Specifies the component type of the component to migrate.
- *DistPolicy*: Specifies the distribution policy to use to determine the destination locality.

```
template<typename Component>
future<naming::id_type> migrate(naming::id_type const &to_migrate, naming::id_type const &target_locality)
```

Migrate the component with the given id to the specified target locality

The function *migrate*<Component> will migrate the component referenced by *to\_migrate* to the locality specified with *target\_locality*. It returns a future referring to the migrated component instance.

**Return** A future representing the global id of the migrated component instance. This should be the same as *migrate\_to*.

**Parameters**

- *to\_migrate*: [in] The global id of the component to migrate.
- *target\_locality*: [in] The locality where the component should be migrated to.

**Template Parameters**

- *Component*: Specifies the component type of the component to migrate.

```
template<typename Derived, typename Stub>
Derived migrate(client_base<Derived, Stub> const &to_migrate, naming::id_type const
&target_locality)
```

Migrate the given component to the specified target locality

The function *migrate*<*Component*> will migrate the component referenced by *to\_migrate* to the locality specified with *target\_locality*. It returns a future referring to the migrated component instance.

**Return** A client side representation of representing of the migrated component instance. This should be the same as *migrate\_to*.

#### Parameters

- *to\_migrate*: [in] The client side representation of the component to migrate.
- *target\_locality*: [in] The id of the locality to migrate this object to.

#### Template Parameters

- *Derived*: Specifies the component type of the component to migrate.

```
namespace hpx
```

```
namespace components
```

```
class runtime_support : public hpx::components::stubs::runtime_support
```

#include <runtime\_support.hpp> The runtime\_support class is the client side representation of a server::runtime\_support component

### Public Functions

```
runtime_support(naming::id_type const &gid = naming::invalid_id)
```

Create a client side representation for the existing server::runtime\_support instance with the given global id *gid*.

```
template<typename Component, typename ...Ts>
```

```
naming::id_type create_component(Ts&&... vs)
```

Create a new component type using the *runtime\_support*.

```
template<typename Component, typename ...Ts>
```

```
lcos::future<naming::id_type> create_component_async(Ts&&... vs)
```

Asynchronously create a new component using the *runtime\_support*.

```
template<typename Component, typename ...Ts>
```

```
std::vector<naming::id_type> bulk_create_component(std::size_t, Ts&&... vs)
```

Asynchronously create N new default constructed components using the *runtime\_support*

```
template<typename Component, typename ...Ts>
```

```
lcos::future<std::vector<naming::id_type>> bulk_create_components_async(std::size_t,
```

*Ts*&&...

*vs*)

Asynchronously create a new component using the *runtime\_support*.

```
lcos::future<int> load_components_async()
```

```
int load_components()
```

```
lcos::future<void> call_startup_functions_async(bool pre_startup)
```

```
void call_startup_functions(bool pre_startup)
```

---

```

lcos::future<void> shutdown_async (double timeout = -1)
 Shutdown the given runtime system.

void shutdown (double timeout = -1)

void shutdown_all (double timeout = -1)
 Shutdown the runtime systems of all localities.

lcos::future<void> terminate_async ()
 Terminate the given runtime system.

void terminate ()

void terminate_all ()
 Terminate the runtime systems of all localities.

void get_config (util::section &ini)
 Retrieve configuration information.

naming::gid_type migrate_component_to_here (std::shared_ptr<Component>
 const &p, naming::id_type
 to_migrate)

void shutdown (double timeout, naming::id_type const &respond_to)
 Gracefully shutdown this runtime system instance.

void shutdown_all (double timeout)
 Gracefully shutdown runtime system instances on all localities.

HPX_NORETURN void hpx::components::server::runtime_support::terminate (naming::id_type const &id)
 Shutdown this runtime system instance.

void terminate_act (naming::id_type const &id)
HPX_NORETURN void hpx::components::server::runtime_support::terminate_all ()
 Shutdown runtime system instances on all localities.

void terminate_all_act ()

util::section get_config ()
 Retrieve configuration information.

int load_components ()
 Load all components on this locality.

void call_startup_functions (bool pre_startup)
void call_shutdown_functions (bool pre_shutdown)
void garbage_collect ()
 Force a garbage collection operation in the AGAS layer.

naming::gid_type create_performance_counter (performance_counters::counter_info const &info)
 Create the given performance counter instance.

void remove_from_connection_cache (naming::gid_type const &gid,
 parcelset::endpoints_type const &eps)
 Remove the given locality from our connection cache.

HPX_DEFINE_COMPONENT_ACTION (runtime_support, load_components)
 termination detection

HPX_DEFINE_COMPONENT_ACTION (runtime_support, call_startup_functions)
HPX_DEFINE_COMPONENT_ACTION (runtime_support, call_shutdown_functions)

HPX_DEFINE_COMPONENT_ACTION(runtime_support, create_performance_counter)
HPX_DEFINE_COMPONENT_ACTION(runtime_support, remove_from_connection_cache)

void run()
 Start the runtime_support component.

void wait()
 Wait for the runtime_support component to notify the calling thread.

This function will be called from the main thread, causing it to block while the HPX functionality is executed. The main thread will block until the shutdown_action is executed, which in turn notifies all waiting threads.

void stop(double timeout, naming::id_type const &respond_to, bool re-
 move_from_remote_caches)
 Notify all waiting (blocking) threads allowing the system to be properly stopped.
```

**Note** This function can be called from any thread.

```
void stopped()
 called locally only

void notify_waiting_main()

bool was_stopped() const

## Public Static Functions

template<typename **Component**, typename ...**Ts**>  
**static lcos::future<naming::id\_type> create\_component\_async**(naming::id\_type  
**const &gid,**  
**Ts&&... vs)**

Create a new component *type* using the *runtime\_support* with the given *targetgid*. This is a non-blocking call. The caller needs to call *future::get* on the result of this function to obtain the global id of the newly created object.

template<typename **Component**, typename ...**Ts**>  
**static naming::id\_type create\_component**(naming::id\_type **const &gid**, **Ts&&... vs)**

Create a new component *type* using the *runtime\_support* with the given *targetgid*. Block for the creation to finish.

template<typename **Component**, typename ...**Ts**>  
**static lcos::future<std::vector<naming::id\_type>> bulk\_create\_component\_colocated\_async**(naming::id\_type  
**const &gid,**  
**std::size\_t count,**  
**Ts&&... vs)**

Create multiple new components *type* using the *runtime\_support* colocated with the with the given *targetgid*. This is a non-blocking call.

template<typename **Component**, typename ...**Ts**>  
**static std::vector<naming::id\_type> bulk\_create\_component\_colocated**(naming::id\_type  
**const &gid,**  
**std::size\_t count,**  
**Ts&&... vs)**

Create multiple new components *type* using the *runtime\_support* colocated with the with the given *targetgid*. Block for the creation to finish.

```
template<typename Component, typename ...Ts>
static lcos::future<std::vector<naming::id_type>> bulk_create_component_async (naming::id_type
const
&gid,
std::size_t count,
Ts&&...
vs)
```

Create multiple new components *type* using the *runtime\_support* on the given locality. This is a non-blocking call.

```
template<typename Component, typename ...Ts>
static std::vector<naming::id_type> bulk_create_component (naming::id_type
const &gid,
std::size_t count,
Ts&&... vs)
```

Create multiple new components *type* using the *runtime\_support* on the given locality. Block for the creation to finish.

```
template<typename Component, typename ...Ts>
static lcos::future<naming::id_type> create_component_colocated_async (naming::id_type
const
&gid,
Ts&&...
vs)
```

Create a new component *type* using the *runtime\_support* with the given *targetgid*. This is a non-blocking call. The caller needs to call *future::get* on the result of this function to obtain the global id of the newly created object.

```
template<typename Component, typename ...Ts>
static naming::id_type create_component_colocated (naming::id_type const
&gid, Ts&&... vs)
```

Create a new component *type* using the *runtime\_support* with the given *targetgid*. Block for the creation to finish.

```
template<typename Component>
static lcos::future<naming::id_type> copy_create_component_async (naming::id_type
const
&gid,
std::shared_ptr<Component>
const
&p, bool
local_op)
```

```

## 2.9 Contributing to HPX

HPX development happens on Github. The following sections are a collection of useful information related to HPX development.

### 2.9.1 Contributing to HPX

The main source of information to understand the process of how to contribute to HPX can be found in [this document](#)<sup>212</sup>. This is a living document that is constantly updated with relevant information.

### 2.9.2 HPX governance model

The HPX project is a meritocratic, consensus-based community project. Anyone with an interest in the project can join the community, contribute to the project design and participate in the decision making process. [This document](#)<sup>213</sup> describes how that participation takes place and how to set about earning merit within the project community.

### 2.9.3 Release procedure for HPX

Below is a step by step procedure for making an HPX release. We aim to produce two releases per year: one in March-April, and one in September-October.

This is a living document and may not be totally current or accurate. It is an attempt to capture current practices in making an HPX release. Please update it as appropriate.

One way to use this procedure is to print a copy and check off the lines as they are completed to avoid confusion.

1. Notify developers that a release is imminent.
2. For minor and major releases: create and check out a new branch at an appropriate point on `master` with the name `release-major.minor.X`. `major` and `minor` should be the major and minor versions of the release. For patch releases: check out the corresponding `release-major.minor.X` branch.
3. Write release notes in `docs/sphinx/releases/whats_new_$.VERSION.rst`. Keep adding merged PRs and closed issues to this until just before the release is made. Use `tools/generate_pr_issue_list.sh` to generate the lists. Add the new release notes to the table of contents in `docs/sphinx/releases.rst`.
4. Build the docs, and proof-read them. Update any documentation that may have changed, and correct any typos. Pay special attention to:
  - `$HPX_SOURCE/README.rst`
    - Update grant information
  - `docs/sphinx/releases/whats_new_$.VERSION.rst`
  - `docs/sphinx/about_hpx/people.rst`
    - Update collaborators

<sup>212</sup> <https://github.com/STELLAR-GROUP/hpx/blob/master/.github/CONTRIBUTING.md>

<sup>213</sup> <http://hpx.stellar-group.org/documents/governance/>

- Update grant information
5. This step does not apply to patch releases. For both APEX and libCDS:
    - Change the release branch to be the most current release tag available in the APEX/libCDS git\_external section in the main CMakeLists.txt. Please contact the maintainers of the respective packages to generate a new release to synchronize with the HPX release (APEX<sup>214</sup>, libCDS<sup>215</sup>).
  6. Make sure HPX\_VERSION\_MAJOR/MINOR/SUBMINOR in CMakeLists.txt contain the correct values. Change them if needed.
  7. This step does not apply to patch releases. Remove features which have been deprecated for at least 2 releases. This involves removing build options which enable those features from the main CMakeLists.txt and also deleting all related code and tests from the main source tree.
- The general deprecation policy involves a three-step process we have to go through in order to introduce a breaking change:
- a. First release cycle: add a build option that allows for explicitly disabling any old (now deprecated) code.
  - b. Second release cycle: turn this build option OFF by default.
  - c. Third release cycle: completely remove the old code.
- The main CMakeLists.txt contains a comment indicating for which version the breaking change was introduced first. In the case of deprecated features which don't have a replacement yet, we keep them around in case (like Vc for example).
8. Update the minimum required versions if necessary (compilers, dependencies, etc.) in building\_hpx.rst.
  9. Verify that the Jenkins setups for the release branch on Rostam and Piz Daint are running and do not display any errors.
  10. Repeat the following steps until satisfied with the release.
    1. Change HPX\_VERSION\_TAG in CMakeLists.txt to -rcN, where N is the current iteration of this step. Start with -rc1.
    2. Create a pre-release on GitHub using the script tools/roll\_release.sh. This script automatically tag with the corresponding release number. The script requires that you have the STELLAR Group signing key.
    3. This step is not necessary for patch releases. Notify hpx-users@stellar-group.org and stellar@cct.lsu.edu of the availability of the release candidate. Ask users to test the candidate by checking out the release candidate tag.
    4. Allow at least a week for testing of the release candidate.
      - Use git merge when possible, and fall back to git cherry-pick when needed. For patch releases git cherry-pick is most likely your only choice if there have been significant unrelated changes on master since the previous release.
      - Go back to the first step when enough patches have been added.
      - If there are no more patches, continue to make the final release.
  11. Update any occurrences of the latest stable release to refer to the version about to be released. For example, quickstart.rst contains instructions to check out the latest stable tag. Make sure that refers to the new version.
  12. Add a new entry to the RPM changelog (cmake/packaging/rpm/Changelog.txt) with the new version number and a link to the corresponding changelog.

<sup>214</sup> <http://github.com/UO-OACISS/xpress-apex>

<sup>215</sup> <https://github.com/STELLAR-GROUP/libcds>

13. Change HPX\_VERSION\_TAG in CMakeLists.txt to an empty string.
14. Add the release date to the caption of the current “What’s New” section in the docs, and change the value of HPX\_VERSION\_DATE in CMakeLists.txt.
15. Create a release on GitHub using the script tools/roll\_release.sh. This script automatically tag the with the corresponding release number. The script requires that you have the STELLAR Group signing key.
16. Update the websites ([hpx.stellar-group.org<sup>216</sup>](https://hpx.stellar-group.org), [stellar-group.org<sup>217</sup>](https://stellar-group.org) and [stellar.cct.lsu.edu<sup>218</sup>](https://stellar.cct.lsu.edu)). You can login on wordpress through *this page* <<https://hpx.stellar-group.org/wp-login.php>>. You can update the pages with the following:
  - Update links on the downloads page. Link to the release on GitHub.
  - Documentation links on the docs page (link to generated documentation on GitHub Pages). Follow the style of previous releases.
  - A new blog post announcing the release, which links to downloads and the “What’s New” section in the documentation (see previous releases for examples).
17. Merge release branch into master.
18. Post-release cleanup. Create a new pull request against master with the following changes:
  1. Modify the release procedure if necessary.
  2. Change HPX\_VERSION\_TAG in CMakeLists.txt back to -trunk.
  3. Increment HPX\_VERSION\_MINOR in CMakeLists.txt.
19. Update Vcpkg (<https://github.com/Microsoft/vcpkg>) to pull from latest release.
  - Update version number in CONTROL
  - Update tag and SHA512 to that of the new release
20. Update spack (<https://github.com/spack/spack>) with the latest HPX package.
  - Update version number in hpx/package.py and SHA256 to that of the new release
21. Announce the release on [hpx-users@stellar-group.org](mailto:hpx-users@stellar-group.org), [stellar@cct.lsu.edu](mailto:stellar@cct.lsu.edu), [allcct@cct.lsu.edu](mailto:allcct@cct.lsu.edu), [faculty@csc.lsu.edu](mailto:faculty@csc.lsu.edu), [faculty@ece.lsu.edu](mailto:faculty@ece.lsu.edu), [xpress@crest.iu.edu](mailto:xpress@crest.iu.edu), the HPX Slack channel, the IRC channel, Sonia Sachs, our list of external collaborators, isocpp.org, reddit.com, HPC Wire, Inside HPC, Heise Online, and a CCT press release.
22. Beer and pizza.

## 2.9.4 Testing HPX

To ensure correctness of *HPX*, we ship a large variety of unit and regression tests. The tests are driven by the CTest<sup>219</sup> tool and are executed automatically on each commit to the *HPX* Github<sup>220</sup> repository. In addition, it is encouraged to run the test suite manually to ensure proper operation on your target system. If a test fails for your platform, we highly recommend submitting an issue on our *HPX* Issues<sup>221</sup> tracker with detailed information about the target system.

---

<sup>216</sup> <https://hpx.stellar-group.org>

<sup>217</sup> <https://stellar-group.org>

<sup>218</sup> <https://stellar.cct.lsu.edu>

<sup>219</sup> <https://gitlab.kitware.com/cmake/community/wikis/doc/ctest/Testing-With-CTest>

<sup>220</sup> <https://github.com/STELLAR-GROUP/hpx/>

<sup>221</sup> <https://github.com/STELLAR-GROUP/hpx/issues>

## Running tests manually

Running the tests manually is as easy as typing `make tests && make test`. This will build all tests and run them once the tests are built successfully. After the tests have been built, you can invoke separate tests with the help of the `ctest` command. You can list all available test targets using `make help | grep tests`. Please see the CTest Documentation<sup>222</sup> for further details.

## Running performance tests

We run performance tests on Piz Daint for each pull request using Jenkins. To run those performance tests locally or on Piz Daint, a script is provided under `tools/perftests_ci/local_run.sh` (to be run in the build directory specifying the *HPX* source directory as the argument to the script, default is `$HOME/projects/hpx_perftests_ci`.

## Adding new performance tests

To add a new performance test, you need to wrap the portion of code to benchmark with `hpx::util::perftests_report`, passing the test name, the executor name and the function to time (can be a lambda). This facility is used to output the time results in a json format (format needed to compare the results and plot them). To effectively print them at the end of your test, call `hpx::util::perftests_print_times`. To see an example of use, see `future_overhead_report.cpp`. Finally, you can add the test to the CI report editing the `hpx_targets` for the executable name and `hpx_test_options` for the corresponding options to use for the run.

## Issue tracker

If you stumble over a bug or missing feature in *HPX*, please submit an issue to our [HPX Issues<sup>223</sup>](#) page. For more information on how to submit support requests or other means of getting in contact with the developers, please see the [Support Website<sup>224</sup>](#) page.

## Continuous testing

In addition to manual testing, we run automated tests on various platforms. We also run tests on all pull requests using both [CircleCI<sup>225</sup>](#) and a combination of [CDash<sup>226</sup>](#) and [pycicle<sup>227</sup>](#). You can see the dashboards here: [CircleCI HPX dashboard<sup>228</sup>](#) and [CDash HPX dashboard<sup>229</sup>](#).

## 2.9.5 Using docker for development

Although it can often be useful to set up a local development environment with system-provided or self-built dependencies, Docker<sup>230</sup> provides a convenient alternative to quickly get all the dependencies needed to start development of *HPX*. Our testing setup on CircleCI<sup>231</sup> uses a docker image to run all tests.

To get started you need to install Docker<sup>232</sup> using whatever means is most convenient on your system. Once you have Docker<sup>233</sup> installed, you can pull or directly run the docker image. The image is based on Debian and Clang, and can be found on Docker Hub<sup>234</sup>. To start a container using the *HPX* build environment, run:

```
$ docker run --interactive --tty stellargroup/build_env:latest bash
```

You are now in an environment where all the *HPX* build and runtime dependencies are present. You can install additional packages according to your own needs. Please see the Docker Documentation<sup>235</sup> for more information on using Docker<sup>236</sup>.

**Warning:** All changes made within the container are lost when the container is closed. If you want files to persist (e.g., the *HPX* source tree) after closing the container, you can bind directories from the host system into the container (see Docker Documentation (Bind mounts)<sup>237</sup>).

## 2.9.6 Documentation

This documentation is built using Sphinx<sup>238</sup>, and an automatically generated API reference using Doxygen<sup>239</sup> and Breathe<sup>240</sup>.

We always welcome suggestions on how to improve our documentation, as well as pull requests with corrections and additions.

### Prerequisites

To build the *HPX* documentation, you need recent versions of the following packages:

- python3
- sphinx 3.5.4 (Python package)
- sphinx\_rtd\_theme (Python package)
- breathe 4.16.0 (Python package)
- doxygen

If the Python<sup>241</sup> dependencies are not available through your system package manager, you can install them using the Python package manager pip:

<sup>230</sup> <https://www.docker.com>

<sup>231</sup> <https://circleci.com>

<sup>232</sup> <https://www.docker.com>

<sup>233</sup> <https://www.docker.com>

<sup>234</sup> [https://hub.docker.com/r/stellargroup/build\\_env/](https://hub.docker.com/r/stellargroup/build_env/)

<sup>235</sup> <https://docs.docker.com/>

<sup>236</sup> <https://www.docker.com>

<sup>237</sup> <https://docs.docker.com/storage/bind-mounts/>

<sup>238</sup> <http://www.sphinx-doc.org>

<sup>239</sup> <https://www.doxygen.org>

<sup>240</sup> <https://breathe.readthedocs.io/en/latest>

<sup>241</sup> <https://www.python.org>

```
pip install --user sphinx sphinx_rtd_theme breathe
```

You may need to set the following CMake variables to make sure CMake can find the required dependencies.

**DOXYGEN\_ROOT:PATH**

Specifies where to look for the installation of the Doxygen<sup>242</sup> tool.

**SPHINX\_ROOT:PATH**

Specifies where to look for the installation of the Sphinx<sup>243</sup> tool.

**BREATHE\_APIDOC\_ROOT:PATH**

Specifies where to look for the installation of the Breathe<sup>244</sup> tool.

## Building documentation

Enable building of the documentation by setting `HPX_WITH_DOCUMENTATION=ON` during CMake<sup>245</sup> configuration. To build the documentation, build the `docs` target using your build tool. The default output format is HTML documentation. You can choose alternative output formats (single-page HTML, PDF, and man) with the `HPX_WITH_DOCUMENTATION_OUTPUT_FORMATS` CMake option.

---

**Note:** If you add new source files to the Sphinx documentation, you have to run CMake again to have the files included in the build.

---

## Style guide

The documentation is written using reStructuredText. These are the conventions used for formatting the documentation:

- Use, at most, 80 characters per line.
- Top-level headings use over- and underlines with =.
- Sub-headings use only underlines with characters in decreasing level of importance: =, – and ..
- Use sentence case in headings.
- Refer to common terminology using :term:`Component`.
- Indent content of directives (.. directive::) by three spaces.
- For C++ code samples at the end of paragraphs, use :: and indent the code sample by 4 spaces.
  - For other languages (or if you don't want a colon at the end of the paragraph), use .. code-block:: language and indent by three spaces as with other directives.
- Use .. list-table:: to wrap tables with a lot of text in cells.

---

<sup>242</sup> <https://www.doxygen.org>

<sup>243</sup> <http://www.sphinx-doc.org>

<sup>244</sup> <https://breathe.readthedocs.io/en/latest>

<sup>245</sup> <https://www.cmake.org>

## API documentation

The source code is documented using Doxygen. If you add new API documentation either to existing or new source files, make sure that you add the documented source files to the `doxygen_dependencies` variable in `docs/CMakeLists.txt`.

### 2.9.7 Module structure

This section explains the structure of an *HPX* module.

The tool `create_library_skeleton.py`<sup>246</sup> can be used to generate a basic skeleton. To create a library skeleton, run the tool in the `libs` subdirectory with the module name as an argument:

```
$./create_library_skeleton <lib_name>
```

This creates a skeleton with the necessary files for an *HPX* module. It will not create any actual source files. The structure of this skeleton is as follows:

- `<lib_name>/`
  - `README.rst`
  - `CMakeLists.txt`
  - `cmake`
  - `docs/`
    - \* `index.rst`
  - `examples/`
    - \* `CMakeLists.txt`
  - `include/`
    - \* `hpx/`
      - `<lib_name>`
  - `src/`
    - \* `CMakeLists.txt`
  - `tests/`
    - \* `CMakeLists.txt`
    - \* `unit/`
      - `CMakeLists.txt`
    - \* `regressions/`
      - `CMakeLists.txt`
    - \* `performance/`
      - `CMakeLists.txt`

---

<sup>246</sup> [https://github.com/STELLAR-GROUP/hpx/blob/master/libs/create\\_library\\_skeleton.py](https://github.com/STELLAR-GROUP/hpx/blob/master/libs/create_library_skeleton.py)

A README.rst should be always included which explains the basic purpose of the library and a link to the generated documentation.

A main CMakeLists.txt is created in the root directory of the module. By default it contains a call to add\_hpx\_module which takes care of most of the boilerplate required for a module. You only need to fill in the source and header files in most cases.

add\_hpx\_module requires a module name. Optional flags are:

Optional single-value arguments are:

- INSTALL\_BINARIES: Install the resulting library.

Optional multi-value arguments-are:

- SOURCES: List of source files.
- HEADERS: List of header files.
- COMPAT\_HEADERS: List of compatibility header files.
- DEPENDENCIES: Libraries that this module depends on, such as other modules.
- CMAKE\_SUBDIRS: List of subdirectories to add to the module.

The include directory should contain only headers that other libraries need. For each of those headers, an automatic header test to check for self containment will be generated. Private headers should be placed under the src directory. This allows for clear separation. The cmake subdirectory may include additional CMake<sup>247</sup> scripts needed to generate the respective build configurations.

Compatibility headers (forwarding headers for headers whose location is changed when creating a module, if moving them from the main library) should be placed in an include\_compatibility directory. This directory is not created by default.

Documentation is placed in the docs folder. A empty skeleton for the index is created, which is picked up by the main build system and will be part of the generated documentation. Each header inside the include directory will automatically be processed by Doxygen and included into the documentation. If a header should be excluded from the API reference, a comment // sphinx:undocumented needs to be added.

Tests are placed in suitable subdirectories of tests.

When in doubt, consult existing modules for examples on how to structure the module.

## Finding circular dependencies

Our CI will perform a check to see if there are circular dependencies between modules. In cases where it's not clear what is causing the circular dependency, running the cpp-dependencies<sup>248</sup> tool manually can be helpful. It can give you detailed information on exactly which files are causing the circular dependency. If you do not have the cpp-dependencies tool already installed, one way of obtaining it is by using our docker image. This way you will have exactly the same environment as on the CI. See *Using docker for development* for details on how to use the docker image.

To produce the graph produced by CI run the following command (HPX\_SOURCE is assumed to hold the path to the HPX source directory):

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --graph-cycles circular_dependencies.dot
```

This will produce a dot file in the current directory. You can inspect this manually with a text editor. You can also convert this to an image if you have graphviz installed:

<sup>247</sup> <https://www.cmake.org>

<sup>248</sup> <https://github.com/tomtom-international/cpp-dependencies>

```
$ dot circular_dependencies.dot -Tsvg -o circular_dependencies.svg
```

This produces an `svg` file in the current directory which shows the circular dependencies. Note that if there are no cycles the image will be empty.

You can use `cpp-dependencies` to print the include paths between two modules.

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest <from> <to>
```

prints all possible paths from the module `<from>` to the module `<to>`. For example, as most modules depend on `config`, the following should give you a long list of paths from `algorithms` to `config`:

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest algorithms config
```

The following should report that it can't find a path between the two modules:

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest config algorithms
```

## 2.10 Releases

### 2.10.1 HPX V1.7.1 (Aug 12, 2021)

This is a bugfix release with a few minor fixes.

#### General changes

- Added a CMake option to assume that all types are bitwise serializable by default: `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`. The default value `OFF` corresponds to the old behaviour.
- Added a version check for Asio. The minimum Asio version supported by *HPX* is 1.12.0.
- Fixed a bug affecting usage of actions, where the internals of *HPX* relied on function addresses being unique. This was fixed by relying on variable addresses being unique instead.
- Made `hpx::util::bind` more strict in checking the validity of placeholders.
- Small performance improvement to spinlocks.
- Adapted the following parallel algorithms to C++20: `inclusive_scan`, `exclusive_scan`, `transform_inclusive_scan`, `transform_exclusive_scan`.

#### Breaking changes

- The experimental `hpx::execution::simdpar` execution policy (introduced in 1.7.0) was renamed to `hpx::execution::par_simd` for consistency with the other parallel policies.

## Closed issues

- Issue #5494<sup>249</sup> - Rename *simdpar* execution policy to *par\_simd*
- Issue #5488<sup>250</sup> - *hpx::util::bind* doesn't bounds-check placeholders
- Issue #5486<sup>251</sup> - Possible V1.7.1 release

## Closed pull requests

- PR #5500<sup>252</sup> - Minor bug fix in transform exclusive and inclusive scan tests
- PR #5499<sup>253</sup> - Rename *simdpar* to *par\_simd*
- PR #5489<sup>254</sup> - Adding bound-checking for bind placeholders
- PR #5485<sup>255</sup> - Add Asio version check
- PR #5482<sup>256</sup> - Change extra archive data to rely on uniqueness of a variable address, not a function address
- PR #5448<sup>257</sup> - More fixes to enable for all types to be assumed to be bitwise copyable
- PR #5445<sup>258</sup> - Improve performance of Spinlocks
- PR #5444<sup>259</sup> - Adapt *transform\_inclusive\_scan* to C++ 20
- PR #5440<sup>260</sup> - Adapt *transform\_exclusive\_scan* to C++ 20
- PR #5439<sup>261</sup> - Adapt *inclusive\_scan* to C++ 20
- PR #5436<sup>262</sup> - Adapt *exclusive\_scan* to C++20

## 2.10.2 HPX V1.7.0 (Jul 14, 2021)

This release is again focused on C++20 conformance of algorithms. Additionally, many new experimental sender-based algorithms have been added based on the latest proposals.

<sup>261</sup> <https://github.com/STELLAR-GROUP/hpx/pull/5439>

<sup>262</sup> <https://github.com/STELLAR-GROUP/hpx/pull/5436>

## General changes

- The following algorithms have been adapted to be C++20 conformant:
  - `remove`,
  - `remove_if`,
  - `remove_copy`,
  - `remove_copy_if`,
  - `replace`,
  - `replace_if`,
  - `reverse`, and
  - `lexicographical_compare`.
- When the compiler and standard library support the standard execution policies `std::execution::seq`, `std::execution::par`, and `std::execution::par_unseq` they can now be used in all *HPX* parallel algorithms with equivalent behaviour to the non-task policies `hpx::execution::seq`, `hpx::execution::par`, and `hpx::execution::par_unseq`.
- Vc support has been fixed, after being broken in 1.6.0. In addition, *HPX* now experimentally supports GCC’s SIMD implementation, when available. The implementation can be used through the `hpx::execution::simd` and `hpx::execution::simdpar` execution policies.
- The customization points `sync_execute`, `async_execute`, `then_execute`, `post`, `bulk_sync_execute`, `bulk_async_execute`, and `bulk_then_execute` are now implemented using `tag_dispatch` (previously `tag_invoke`). Executors can still be implemented by providing the aforementioned functions as member functions of an executor.
- New functionality, enhancements, and fixes based on P0443r14 (executors proposal) and P1897 (sender-based algorithms) have been added to the `hpx::execution::experimental` namespace. These can be accessed through the `hpx/execution.hpp` and `hpx/local/execution.hpp` headers. In particular, the following sender-based algorithms have been added:
  - `detach`,
  - `ensure_started`,
  - `just`,
  - `just_on`,
  - `let_error`,
  - `let_value`,
  - `on`,
  - `transform`, and
  - `when_all`.

Additionally, futures now implement the sender concept. `make_future` can be used to turn a sender into a future. All functionality is experimental and can change without notice.

- All `hpx::init` and `hpx::start` overloads now take `std::functions` instead of `hpx::util::function_nons`. No changes should be required in user code to accommodate this change.

- `hpx::util::unwrapping` and other related unwrapping functionality has been moved up into the `hpx` namespace. Names in `hpx::util` are still usable with a deprecation warning. This functionality can now be accessed through the `hpx/unwrap.hpp` and `hpx/local/unwrap.hpp` headers.
- The default tag for APEX has been update from 2.3.1 to 2.4.0. In particular, this fixes a bug which could lead to hangs in distributed runs.
- The dependency on Boost.Asio has been replaced with the standalone Asio available at <https://github.com/chriskohlhoff/asio>. By default, a system-installed Asio will be used. `ASIO_ROOT` can be given as a hint to tell CMake where to find Asio. Alternatively, Asio can be fetched automatically using CMake's `fetchcontent` by setting `HPX_WITH_FETCH_ASIO=ON`. In general, dependencies on Boost have again been reduced.
- Modularization of the library has continued. In this release almost all functionality has been moved into modules. These changes do not generally affect user code. Warnings are still issued for headers that have moved.
- `hipBLAS` is now optional when compiling with `hipcc`. A warning instead of an error will be printed if `hipBLAS` is not found during configuration.
- Previously `HPX_COMPUTE_HOST_CODE` was defined in host code only if HPX was configured with CUDA or HIP. In this release `HPX_COMPUTE_HOST_CODE` is always defined in host code.
- An experimental `HPX_WITH_PRECOMPILED_HEADERS` CMake option has been added to use precompiled headers when building HPX. This option should not be used on Windows.
- Numerous bug fixes.

## Breaking changes

- The minimum required CMake version is now 3.17.
- The minimum required Boost version is now 1.71.0.
- The customization mechanism used to implement and extend sender functionality and algorithms has been renamed from `tag_invoke` to `tag_dispatch`. All customization of sender functionality should be done by overloading `tag_dispatch`.
- The following compatibility options have been removed, along with their compatibility implementations:
  - `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`
  - `HPX_WITH_ACTION_BASE_COMPATIBILITY`
  - `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`
  - `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`
  - `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`
  - `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`
  - `HPX_WITH_REGISTER_THREAD_OVERLOADS_COMPATIBILITY`
  - `HPX_WITH_THREAD_AWARE_TIMER_COMPATIBILITY`
  - `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`
  - `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`
- The `HPX_WITH_THREAD_SCHEDULERS` CMake option has been removed. All schedulers are now enabled when possible.
- `HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY` has been turned off by default.

## 2.10.3 HPX V1.6.0 (Feb 17, 2021)

### General changes

This release continues the focus on C++20 conformance with multiple new algorithms adapted to be C++20 conformant and becoming customization point objects (CPOs). We have also added experimental support for HIP, allowing previous CUDA features to now be compiled with `hipcc` and run on AMD GPUs.

- The following algorithms have been adapted to be C++20 conformant: `adjacent_find`, `includes`, `inplace_merge`, `is_heap`, `is_heap_until`, `is_partitioned`, `is_sorted`, `is_sorted_until`, `merge`, `set_difference`, `set_intersection`, `set_symmetric_difference`, `set_union`.
- Experimental HIP support can be enabled by compiling *HPX* with `hipcc`. All CUDA functionality in *HPX* can now be used with HIP. The HIP functionality is for the time being exposed through the same API as the CUDA functionality, i.e. no changes are required in user code. The CUDA, and now HIP, functionality is in the `hpx::cuda` namespace.
- We have added `partial_sort` based on Francisco Tapia's implementation.
- `hpx::init` and `hpx::start` gained new overloads taking an `hpx::init_params` struct in 1.5.0. All overloads not taking an `hpx::init_params` are now deprecated.
- We have added an experimental `fork_join_executor`. This executor can be used for OpenMP-style fork-join parallelism, where the latency of a parallel region is important for performance.
- The `parallel_executor` now uses a hierarchical spawning scheme for bulk execution, which improves data locality and performance.
- `hpx::dataflow` can now be used with executors that inject additional parameters into the call of the user-provided function.
- We have added experimental support for properties as proposed in P2220<sup>509</sup>. Currently the only supported property is the scheduling hint on `parallel_executor`.
- `hpx::util::annotated_function` can now be passed a dynamically generated `std::string`.
- In moving functionality to new namespaces, old names have been deprecated. A deprecation warning will be issued if you are using deprecated functionality, with instructions on how to correct or ignore the warning.
- We have removed all support for C and Fortran from our build system.
- We have further reduced the use of Boost types within *HPX* (`boost::system::error_code` and `boost::detail::spinlock`).
- We have enabled more warnings in our CI builds (unused variables and unused typedefs).

### Breaking changes

- `hpxMP` support has been completely removed.
- The verbs `parcelport` has been removed.
- The following compatibility options have been disabled by default: `HPX_WITH_ACTION_BASE_COMPATIBILITY`, `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`, `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`, `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`, `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`, `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`, `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`, `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`, `HPX_THREAD_AWARE_TIMER_COMPATIBILITY`,

<sup>509</sup> <http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2020/p2220r0.pdf>

HPX\_WITH\_POOL\_EXECUTOR\_COMPATIBILITY. Unless noted here, the above functionalities do not come with replacements. Unscoped enumerations have been replaced by scoped enumerations. Previously deprecated unscoped enumerations are disabled by HPX\_WITH\_UNSCOPE\_ENUM\_COMPATIBILITY. Newly deprecated unscoped enumerations have been given deprecation warnings and replaced by scoped enumerations. `hpx::promise` has been replaced with `hpx::distributed::promise`. `hpx::program_options` is a drop-in replacement for `boost::program_options`. `hpx::execution::parallel_executor` now has constructors which take a thread pool, covering the use case of `hpx::threads::executors::pool_executor`. A pool can be supplied with `hpx::resource::get_thread_pool`.

## Closed issues

- Issue #5148<sup>510</sup> - `runtime_support.hpp` does not work with newer cling
- Issue #5147<sup>511</sup> - Wrong results with parallel reduce
- Issue #5129<sup>512</sup> - Missing specialization for `std::hash<hpx::thread::id>`
- Issue #5126<sup>513</sup> - Use `std::string` for task annotations
- Issue #5115<sup>514</sup> - Don't expect hwloc to always report Cores
- Issue #5113<sup>515</sup> - Handle threadmanager exceptions during startup
- Issue #5112<sup>516</sup> - libatomic problems causing unexpected fails
- Issue #5089<sup>517</sup> - Remove non-BSL files
- Issue #5088<sup>518</sup> - Unwrapping problem
- Issue #5087<sup>519</sup> - Remove hpxMP support
- Issue #5077<sup>520</sup> - PAPI counters are not accessible when HPX is installed
- Issue #5075<sup>521</sup> - Make the structs in all `iter_sent.hpp` lower case
- Issue #5067<sup>522</sup> - Bug `string_util/split.hpp`
- Issue #5049<sup>523</sup> - Change back the hipcc jenkins config to the fury partition on rostam
- Issue #5038<sup>524</sup> - Not all examples link in the latest HPX master
- Issue #5035<sup>525</sup> - Build with HPX\_WITH\_EXAMPLES fails
- Issue #5019<sup>526</sup> - Broken help string for hpx
- Issue #5016<sup>527</sup> - `hpx::parallel::fill` fails compiling

## 2.10.4 HPX V1.5.1 (Sep 30, 2020)

### General changes

This is a patch release. It contains the following changes:

- Remove restriction on suspending runtime with multiple localities, users are now responsible for synchronizing work between localities before suspending.
- Fixes several compilation problems and warnings.
- Adds notes in the documentation explaining how to cite HPX.

### Closed issues

- Issue #4971<sup>684</sup> - Parallel sort fails to compile with C++20
- Issue #4950<sup>685</sup> - Build with *HPX\_WITH\_PARCELPORT\_ACTION\_COUNTERS ON* fails
- Issue #4940<sup>686</sup> - Codespell report for “HPX” (on fossies.org)
- Issue #4937<sup>687</sup> - Allow suspension of runtime for multiple localities

### Closed pull requests

- PR #4982<sup>688</sup> - Add page about citing HPX to documentation
- PR #4981<sup>689</sup> - Adding the missing include
- PR #4974<sup>690</sup> - Remove leftover format export hack
- PR #4972<sup>691</sup> - Removing use of get\_temporary\_buffer and return\_temporary\_buffer
- PR #4963<sup>692</sup> - Renaming files to avoid warnings from the vs build system
- PR #4951<sup>693</sup> - Fixing build if HPX\_WITH\_PARCELPORT\_ACTION\_COUNTERS=On
- PR #4946<sup>694</sup> - Allow suspension on multiple localities
- PR #4944<sup>695</sup> - Fix typos reported by fossies codespell report
- PR #4941<sup>696</sup> - Adding some explanation to README about how to cite HPX
- PR #4939<sup>697</sup> - Small changes

## 2.10.5 HPX V1.5.0 (Sep 02, 2020)

### General changes

The main focus of this release is on APIs and C++20 conformance. We have added many new C++20 features and adapted multiple algorithms to be fully C++20 conformant. As part of the modularization we have begun specifying the public API of *HPX* in terms of headers and functionality, and aligning it more closely to the C++ standard. All non-distributed modules are now in place, along with an experimental option to completely disable distributed features in *HPX*. We have also added experimental asynchronous MPI and CUDA executors. Lastly this release introduces CMake targets for depending projects, performance improvements, and many bug fixes.

- We have added the C++20 features `hpx::jthread` and `hpx::stop_token`. `hpx::condition_variable_any` now exposes new functions supporting `hpx::stop_token`.
- We have added `hpx::stable_sort` based on Francisco Tapia's implementation.
- We have adapted existing synchronization primitives to be fully conformant C++20: `hpx::barrier`, `hpx::latch`, `hpx::counting_semaphore`, and `hpx::binary_semaphore`.
- We have started using customization point objects (CPOs) to make the corresponding algorithms fully conformant to C++20 as well as to make algorithm extension easier for the user. `all_of/any_of/none_of`, `copy`, `count`, `destroy`, `equal`, `fill`, `find`, `for_each`, `generate`, `mismatch`, `move`, `reduce`, `transform_reduce` are using those CPOs (all in namespace `hpx`). We also have adapted their corresponding `hpx::ranges` versions to be conforming to C++20 in this release.
- We have adapted support for `co_await` to C++20, in addition to `hpx::future` it now also supports `hpx::shared_future`. We have also added allocator support for futures returned by `co_return`. It is no longer in the experimental namespace.
- We added serialization support for `std::variant` and `std::tuple`.
- `result_of` and `is_callable` are now deprecated and replaced by `invoke_result` and `is_invocable` to conform to C++20.
- We continued with the modularization, making it easier for us to add the new experimental `HPX_WITH_DISTRIBUTED_RUNTIME` CMake option (see below). A significant amount of headers have been deprecated. We adapted the namespaces and headers we could to be closer to the standard ones (*Public API*). Depending code should still compile, however warnings are now generated instructing to change the include statements accordingly.
- It is now possible to have a basic CUDA support including a helper function to get a future from a CUDA stream and target handling. They are available under the `hpx::cuda::experimental` namespace and they can be enabled with the `-DHPX_WITH_ASYNC_CUDA=ON` CMake option.
- We added a new `hpx::mpi::experimental` namespace for getting futures from an asynchronous MPI call and a new minimal MPI executor `hpx::mpi::experimental::executor`. These can be enabled with the `-DHPX_WITH_ASYNC_MPI=On` CMake option.
- A polymorphic executor has been implemented to reduce compile times as a function accepting executors can potentially be instantiated only once instead of multiple times with different executors. It accepts the function signature as a template argument. It needs to be constructed from any other executor. Please note, that the function signatures that can be scheduled using `then_execute`, `bulk_sync_execute`, `bulk_async_execute` and `bulk_then_execute` are slightly different (See the comment in PR #4514<sup>698</sup> for more details).
- The underlying executor of `block_executor` has been updated to a newer one.
- We have added a parameter to `auto_chunk_size` to control the amount of iterations to measure.

<sup>698</sup> <https://github.com/STELLAR-GROUP/hpx/pull/4514>

- All executor parameter hooks can now be exposed through the executor itself. This will allow to deprecate the `.with()` functionality on execution policies in the future. This is also a first step towards simplifying our executor APIs in preparation for the upcoming C++23 executors (senders/receivers).
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`. Please note this is a breaking change without backwards-compatibility option. We have converted all of those APIs to be based on customization point objects. Two new executors have been added to enable easy integration of the existing resiliency features with other facilities (like the parallel algorithms): `replay_executor` and `replicate_executor`.
- We have added performance counters type information (aggregating, monotonically increasing, average count, average timer, etc.).
- HPX threads are now re-scheduled on the same worker thread they were suspended on to avoid cache misses from moving from one thread to the other. This behavior doesn't prevent the thread from being stolen, however.
- We have added a new configuration option `hpx.exception_verbosity` to allow to control the level of verbosity of the exceptions (3 levels available).
- `broadcast_to`, `broadcast_from`, `scatter_to` and `scatter_from` have been added to the collectives, modernization of `gather_here` and `gather_there` with futures taken by rvalue references. See the breaking change on `all_to_all` in the next section. None of the collectives need supporting macros anymore (e.g. specifying the data types used for a collective operation using `HPX_REGISTER_ALLGATHER` and similar is not needed anymore).
- New API functions have been added: a) to get the number of cores which are idle (`hpx::get_idle_core_count`) and b) returning a bitmask representing the currently idle cores (`hpx::get_idle_core_mask`).
- We have added an experimental option to only enable the local runtime, you can disable the distributed runtime with `HPX_WITH_DISTRIBUTED_RUNTIME=OFF`. You can also enable the local runtime by using the `--hpx:local` runtime option.
- We fixed task annotations for actions.
- The alias `hpx::promise` to `hpx::lcos::promise` is now deprecated. You can use `hpx::lcos::promise` directly instead. `hpx::promise` will refer to the local-only promise in the future.
- We have added a `prepare_checkpoint` API function that calculates the amount of necessary buffer space for a particular set of arguments checkpointed.
- We have added `hpx::upgrade_lock` and `hpx::upgrade_to_unique_lock`, which make `hpx::shared_mutex` (and similar) usable in more flexible ways.
- We have changed the CMake targets exposed to the user, it now includes `HPX::hpx`, `HPX::wrap_main` (int `main` as the first HPX thread of the application, see *Starting the HPX runtime*), `HPX::plugin`, `HPX::component`. The CMake variables `HPX_INCLUDE_DIRS` and `HPX_LIBRARIES` are deprecated and will be removed in a future release, you should now link directly to the `HPX::hpx` CMake target.
- A new example is demonstrating how to create and use a wrapping executor (`quickstart/executor_with_thread_hooks.cpp`)
- A new example is demonstrating how to disable thread stealing during the execution of parallel algorithms (`quickstart/disable_thread_stealing_executor.cpp`)
- We now require for our CMake build system configuration files to be formatted using `cmake-format`.
- We have removed more dependencies on various Boost libraries.
- We have added an experimental option enabling unity builds of HPX using the `-DHPX_WITH_UNITY_BUILD=On` CMake option.

- Many bug fixes.

## Breaking changes

- HPX now requires a C++14 capable compiler. We have set the HPX C++ standard automatically to C++14 and if it needs to be set explicitly, it should be specified through the `CMAKE_CXX_STANDARD` setting as mandated by CMake. The `HPX_WITH_CXX*` variables are now deprecated and will be removed in the future.
- Building and using HPX is now supported only when using CMake V3.13 or later, Boost V1.64 or newer, and when compiling with clang V5, gcc V7, or VS2019, or later. Other compilers might still work but have not been tested thoroughly.
- We have added a `hpx::init_params` struct to pass parameters for HPX initialization e.g. the resource partitioner callback to initialize thread pools (*Using the resource partitioner*).
- The `all_to_all` algorithm is renamed to `all_gather`, and the new `all_to_all` algorithm is not compatible with the old one.
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`.

## Closed issues

- Issue #4918<sup>699</sup> - Rename distributed\_executors module
- Issue #4900<sup>700</sup> - Adding JOSS status badge to README

- PR #4917<sup>802</sup> - Move chrono functionality to hpx::chrono namespace
- PR #4916<sup>803</sup> - HPX\_HAVE\_DEPRECATED\_WARNINGS needs to be set even when disabled
- PR #4915<sup>804</sup> - Moving more action related files to actions modules
- PR #4914<sup>805</sup> - Add alias targets with namespaces used for exporting
- PR #4912<sup>806</sup> - Aggregate initialize CPOs
- PR #4910<sup>807</sup> - Explicitly specify hwloc root on Jenkins CSCS builds
- PR #4908<sup>808</sup> - Fix algorithms documentation
- PR #4907<sup>809</sup> - Remove HPX::hpx\_no\_wrap\_main target
- PR #4906<sup>810</sup> - Fixing unused variable warning
- PR #4905<sup>811</sup> - Adding specializations for simple for\_loops
- PR #4904<sup>812</sup> - Update boost to 1.74.0 for the newest jenkins configs
- PR #4903<sup>813</sup> - Hide GITHUB\_TOKEN environment variables from environment variable output
- PR #4902<sup>814</sup> - Cancel previous pull requests builds before starting a new one with Jenkins
- PR #4901<sup>815</sup> - Update public API list with updated algorithms
- PR #4899<sup>816</sup> - Suggested changes for HPX V1.5 release notes
- PR #4898<sup>817</sup> - Minor tweak to hpx::equal implementation
- PR #4896<sup>818</sup> - Making generate() and generate\_n conforming to C++20
- PR #4895<sup>819</sup> - Update apex tag
- PR #4894<sup>820</sup> - Fix exception handling for tasks
- PR #4893<sup>821</sup> - Remove last use of std::result\_of, removed in C++20
- PR #4892<sup>822</sup> - Adding replay\_executor and replicate\_executor
- PR #4889<sup>823</sup> - Restore old behaviour of not requiring linking to hpx\_wrap when HPX\_WITH\_DYNAMIC\_HPX\_MAIN=OFF
- PR #4887<sup>824</sup> - Making sure remotely thrown (non-hpx) exceptions are properly marshaled back to invocation

- PR #4707<sup>939</sup> - Use hpx::function\_nonser instead of std::function internally
- PR #4706<sup>940</sup> - Move header file to module
- PR #4705<sup>941</sup> - Fix incorrect behaviour of cmake-format check
- PR #4704<sup>942</sup> - Fix resource tests
- PR #4701<sup>943</sup> - Fix missing includes for future::then specializations
- PR #4700<sup>944</sup> - Removing obsolete memory component
- PR #4699<sup>945</sup> - Add short descriptions to modules missing documentation
- PR #4696<sup>946</sup> - Rename generated modules headers
- PR #4693<sup>947</sup> - Overhauling thread\_mapper for public consumption
- PR #4688<sup>948</sup> - Fix thread stack size handling
- PR #4687<sup>949</sup> - Adding all\_gather and fixing all\_to\_all
- PR #4684<sup>950</sup> - Miscellaneous compilation fixes
- PR #4683<sup>951</sup> - Fix HPX\_WITH\_DYNAMIC\_HPX\_MAIN=OFF
- PR #4682<sup>952</sup> - Fix compilation of pack\_traversal\_rebind\_container.hpp
- PR #4681<sup>953</sup> - Add missing hpx/execution.hpp includes for future::then
- PR #4678<sup>954</sup> - Typeless communicator
- PR #4677<sup>955</sup> - Forcing registry option to be accepted without checks.
- PR #4676<sup>956</sup> - Adding scatter\_to/scatter\_from collective operations
- PR #4673<sup>957</sup> - Fix PAPI counters compilation
- PR #4671<sup>958</sup> - Deprecate hpx::promise alias to hpx::lcos::promise
- PR #4670<sup>959</sup> - Explicitly instantiate get\_exception
- PR #4667<sup>960</sup> - Add stopValue in Sentinel struct instead of Iterator
- PR #4666<sup>961</sup> - Add release build on Windows to GitHub actions

- PR #4460<sup>1080</sup> - Suppress MPI warnings in version.cpp
- PR #4459<sup>1081</sup> - Make sure pkgconfig applications link with hpx\_init
- PR #4458<sup>1082</sup> - Added example demonstrating how to create and use a wrapping executor
- PR #4457<sup>1083</sup> - Fixing execution of thread exit functions
- PR #4456<sup>1084</sup> - Move backtrace files to debugging module
- PR #4455<sup>1085</sup> - Move deadlock\_detection and maintain\_queue\_wait\_times source files into schedulers module
- PR #4450<sup>1086</sup> - Fixing compilation with std::filesystem enabled
- PR #4449<sup>1087</sup> - Fixing build system to actually build variant test
- PR #4447<sup>1088</sup> - This fixes an obsolete #include
- PR #4446<sup>1089</sup> - Resume tasks where they were suspended
- PR #4444<sup>1090</sup> - Minor CUDA fixes
- PR #4443<sup>1091</sup> - Add missing tests to CircleCI config
- PR #4442<sup>1092</sup> - Adding a tag to all auto-generated files allowing for tools to visually distinguish those
- PR #4441<sup>1093</sup> - Adding performance counter type information
- PR #4440<sup>1094</sup> - Fixing MSVC build
- PR #4439<sup>1095</sup> - Link HPX::plugin and component privately in hpx\_setup\_target
- PR #4437<sup>1096</sup> - Adding a test that verifies the problem can be solved using a trait specialization
- PR #4434<sup>1097</sup> - Clean up Boost dependencies and copy string algorithms to new module
- PR #4433<sup>1098</sup> - Fixing compilation issues (!) if MPI parcelport is enabled
- PR #4431<sup>1099</sup> - Ignore warnings about name mangling changing

## 2.10.6 HPX V1.4.1 (Feb 12, 2020)

### General changes

This is a bugfix release. It contains the following changes:

- Fix compilation issues on Windows, macOS, FreeBSD, and with gcc 10
- Install missing .pdb files on Windows
- Allow running tests using an installed version of *HPX*
- Skip MPI finalization if HPX has not initialized MPI
- Give a hard error when attempting to use IO counters on Windows

### Closed issues

- Issue #4320<sup>1197</sup> - HPX 1.4.0 does not compile with gcc 10
- Issue #4336<sup>1198</sup> - Building HPX 1.4.0 with IO Counters breaks (Windows)
- Issue #4334<sup>1199</sup> - HPX Debug and RelWithDebinfo builds on Windows not installing .pdb files
- Issue #4322<sup>1200</sup> - Undefine VT1 and VT2 after boost includes
- Issue #4314<sup>1201</sup> - Compile error on 1.4.0

- PR #4357<sup>1204</sup> - Adding missing #includes to fix gcc V10 linker problems
- PR #4353<sup>1205</sup> - Skip MPI\_Finalize if MPI\_Init is not called from HPX
- PR #4343<sup>1206</sup> - Give a hard error if IO counters are enabled on non-Linux systems
- PR #4337<sup>1207</sup> - Installing pdb files on Windows
- PR #4335<sup>1208</sup> - Adding capability to buildsystem to use an installed version of HPX
- PR #4315<sup>1209</sup> - Forcing exported symbols from composable\_guard to be linked into core library
- PR #4310<sup>1210</sup> - Remove environment handling from exception.cpp

## 2.10.7 HPX V1.4.0 (January 15, 2020)

### General changes

- We have added the collectives all\_to\_all and all\_reduce.
- We have added APIs for resiliency, which allows replication and replay for failed tasks. See the *documentation* for more details.
- Components can now be checkpointed.
- Performance improvements to schedulers and coroutines. A significant change is the addition of stackless coroutines. These are to be used for tasks that do not need to be suspended and can reduce overheads noticeably in applications with short tasks. A stackless coroutine can be created with the new stack size `thread_stacksize_nostack`.
- We have added an implementation of `unique_any`, which is a non-copyable version of `any`.
- The `shared_priority_queue_scheduler` has been improved. It now has lower overheads than the default scheduler in many situations. Unlike the default scheduler it fully supports NUMA scheduling hints. Enable it with the command line option `--hpx:queuing=shared-priority`. This scheduler should still be considered experimental, but its use is encouraged in real applications to help us make it production ready.
- We have added the performance counters `background-receive-duration` and `background-receive-overhead` for inspecting the time and overhead spent on receiving parcels in the background.
- Compilation time has been further improved when `HPX_WITH_NETWORKING=OFF`.
- We no longer require compiled Boost dependencies in certain configurations. This requires at least Boost 1.70, compiling on x86 with GCC 9, clang (libc++) 9, or VS2019 in C++17 mode. The dependency on Boost.Filesystem can explicitly be turned on with `HPX_FILESYSTEM_WITH_BOOST_FILESYSTEM_COMPATIBILITY=ON` (it is off by default if the standard library supports `std::filesystem`). Boost.ProgramOptions has been copied into the HPX repository. We have a compatibility layer for users who must explicitly use

<sup>1203</sup> <https://github.com/STELLAR-GROUP/hpx/pull/4376>

<sup>1204</sup> <https://github.com/STELLAR-GROUP/hpx/pull/4357>

<sup>1208</sup> <https://github.com/STELLAR-GROUP/hpx/pull/4335>

<sup>1209</sup> <https://github.com/STELLAR-GROUP/hpx/pull/4315>

<sup>1210</sup> <https://github.com/STELLAR-GROUP/hpx/pull/4310>

Boost.ProgramOptions instead of the ProgramOptions provided by HPX. To remove the dependency `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY` must be explicitly set to OFF. This option will be removed in a future release. We have also removed several other header-only dependencies on Boost.

- It is now possible to use the process affinity mask set by tools like numactl and various batch environments with the command line option `--hpx:use-process-mask`. Enabling this option implies `--hpx:ignore-batch-env`.
- It is now possible to create standalone thread pools without starting the runtime. See the `standalone_thread_pool_executor.cpp` test in the execution module for an example.
- Tasks annotated with `hpx::util::annotated_function` now have their correct name when using APEX to generate OTF2 files.
- Cloning of APEX was defective in previous releases (it required manual intervention to check out the correct tag or branch). This has been fixed.
- The option `HPX_WITH_MORE_THAN_64_THREADS` is now ignored and will be removed in a future release. The value is instead derived directly from `HPX_WITH_MAX_CPU_COUNT` option.
- We have deprecated compiling in C++11 mode. The next release will require a C++14 capable compiler.
- We have deprecated support for the Vc library. This option will be replaced with SIMD support from the standard library in a future release.
- We have significantly refactored our CMake setup. This is intended to be a non-breaking change and will allow for using HPX through CMake targets in the future.
- We have continued modularizing the HPX library. In the process we have rearranged many header files into module-specific directories. All moved headers have compatibility headers which forward from the old location to the new location, together with a deprecation warning. The compatibility headers will eventually be removed.
- We now enforce formatting with `clang-format` on the majority of our source files.
- We have added SPDX license tags to all files.
- Many bugfixes.

## Breaking changes

- The `HPX_WITH_THREAD_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_UNWRAPPED_COMPATIBILITY` option and the associated compatibility layer has been removed.

- PR #4173<sup>1351</sup> - Wait for runtime to be running before returning from hpx::start
- PR #4172<sup>1352</sup> - More protection against shutdown problems in error handling scenarios.
- PR #4171<sup>1353</sup> - Ignore lock in condition\_variable::wait
- PR #4170<sup>1354</sup> - Adding APEX dependency to MPI parcelport
- PR #4168<sup>1355</sup> - Adding utility include
- PR #4167<sup>1356</sup> - Add a condition to setup the external libraries
- PR #4166<sup>1357</sup> - Add an INTERNAL\_FLAGS option to link to hpx\_internal\_flags
- PR #4165<sup>1358</sup> - Forward HPX\_\* cmake cache variables to external projects
- PR #4164<sup>1359</sup> - Affinity and batch environment modules
- PR #4162<sup>1360</sup> - Handle quick\_exit
- PR #4160<sup>1361</sup> - Using target\_link\_libraries for cmake versions >= 3.12
- PR #4159<sup>1362</sup> - Make sure HPX\_WITH\_NATIVE\_TLS is forwarded to dependent projects
- PR #4158<sup>1363</sup> - Adding allocator imported target as a dependency of allocator module
- PR #4157<sup>1364</sup> - Add hpx\_memory as a dependency of parcelport plugins
- PR #4156<sup>1365</sup> - Stackless coroutines now can refer to themselves (through get\_self() and friends)
- PR #4154<sup>1366</sup> - Added CMake policy CMP0060 for HPX applications.
- PR #4153<sup>1367</sup> - add header iomanip to tests and tool
- PR #4152<sup>1368</sup> - Casting MPI tag value
- PR #4149<sup>1369</sup> - Add back private m\_desc member variable in program\_options module
- PR #4147<sup>1370</sup> - Resource partitioner and threadmanager modules
- PR #4146<sup>1371</sup> - Google Season of Docs updates to documentation; creating hpx projects
- PR #4145<sup>1372</sup> - Adding basic support for stackless threads
- PR #4143<sup>1373</sup> - Exclude test\_client\_1950 from all target

## 2.10.8 HPX V1.3.0 (May 23, 2019)

### General changes

- Performance improvements: the schedulers have significantly reduced overheads from removing false sharing and the parallel executor has been updated to create fewer futures.
- HPX now defaults to not turning on networking when running on one locality. This means that you can run multiple instances on the same system without adding command line options.
- Multiple issues reported by Clang sanitizers have been fixed.
- We have added (back) single-page HTML documentation and PDF documentation.
- We have started modularizing the HPX library. This is useful both for developers and users. In the long term users will be able to consume only parts of the HPX libraries if they do not require all the functionality that HPX currently provides.
- We have added an implementation of `function_ref`.
- The `barrier` and `latch` classes have gained a few additional member functions.

### Breaking changes

- Executable and library targets are now created without the `_exe` and `_lib` suffix respectively. For example, the target `1d_stencil_1_exe` is now simply called `1d_stencil_1`.
- We have removed the following deprecated functionality: `queue`, `scoped_unlock`, and support for input iterators in algorithms.
- We have turned off the compatibility layer for `unwrapped` by default. The functionality will be removed in the next release. The option can still be turned on using the `CMake`<sup>1578</sup> option `HPX_WITH_UNWRAPPED_SUPPORT`. Likewise, `inclusive_scan` compatibility overloads have been turned off by default. They can still be turned on with `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY`.
- The minimum compiler and dependency versions have been updated. We now support GCC from version 5 onwards, Clang from version 4 onwards, and Boost from version 1.61.0 onwards.
- The headers for preprocessor macros have moved as a result of the functionality being moved to a separate module. The old headers are deprecated and will be removed in a future version of HPX. You can turn off the warnings by setting `HPX_PREPROCESSOR_WITH_DEPRECATED_WARNINGS=OFF` or turn off the compatibility headers completely with `HPX_PREPROCESSOR_WITH_COMPATIBILITY_HEADERS=OFF`.

### Closed issues

- Issue #3863<sup>1579</sup> - shouldn't “-faligned-new” be a usage requirement?

1628 <https://github.com/STELLAR-GROUP/hpx/issues/3575>

1629 <https://github.com/STELLAR-GROUP/hpx/issues/3570>

- Issue #3567<sup>1630</sup> - Build succeed and make failed for hpx : cout
- Issue #3565<sup>1631</sup> - Polymorphic simple component destructor not getting called
- Issue #3559<sup>1632</sup> - 1.2.0 is missing from download page
- Issue #3554<sup>1633</sup> - Clang 6.0 warning of hiding overloaded virtual function
- Issue #3510<sup>1634</sup> - Build on ppc64 fails
- Issue #3482<sup>1635</sup> - Improve error message when HPX\_WITH\_MAX\_CPU\_COUNT is too low for given system
- Issue #3453<sup>1636</sup> - Two HPX applications can't run at the same time.
- Issue #3452<sup>1637</sup> - Scaling issue on the change to 2 NUMA domains
- Issue #3442<sup>1638</sup> - HPX set\_difference, set\_intersection failure cases
- Issue #3437<sup>1639</sup> - Ensure parent\_task pointer when child task is created and child/parent are on same locality
- Issue #3255<sup>1640</sup> - Suspension with lock for --hpx:list-component-types
- Issue #3034<sup>1641</sup> - Use C++17 structured bindings for serialization
- Issue #2999<sup>1642</sup> - Change thread scheduling use of size\_t for thread indexing

## Closed pull requests

- PR #3865<sup>1643</sup> - adds hpx\_target\_compile\_option\_if\_available
- PR #3864<sup>1644</sup> - Helper functions that are useful in numa binding and testing of allocator
- PR #3862<sup>1645</sup> - Temporary fix to local\_dataflow\_boost\_small\_vector test
- PR #3860<sup>1646</sup> - Add cache line padding to intermediate results in for loop reduction
- PR #3859<sup>1647</sup> - Remove HPX\_TLL\_PUBLIC and HPX\_TLL\_PRIVATE from CMake files
- PR #3858<sup>1648</sup> - Add compile flags and definitions to modules
- PR #3851<sup>1649</sup> - update hpxmp release tag to v0.2.0
- PR #3849<sup>1650</sup> - Correct BOOST\_ROOT variable name in quick start guide
- PR #3847<sup>1651</sup> - Fix attach\_debugger configuration option

<sup>1651</sup> <https://github.com/STELLAR-GROUP/hpx/pull/3847>

- PR #3846<sup>1652</sup> - Add tests for libs header tests
- PR #3844<sup>1653</sup> - Fixing source\_groups in preprocessor module to properly handle compatibility headers
- PR #3843<sup>1654</sup> - This fixes the launch\_process/launched\_process pair of tests
- PR #3842<sup>1655</sup> - Fix macro call with ITTNOTIFY enabled
- PR #3840<sup>1656</sup> - Fixing SLURM environment parsing
- PR #3837<sup>1657</sup> - Fixing misplaced #endif
- PR #3835<sup>1658</sup> - make all latch members protected for consistency
- PR #3834<sup>1659</sup> - Disable transpose\_block numa example on CircleCI
- PR #3833<sup>1660</sup> - make latch **counter** protected for deriving latch in hpxmp
- PR #3831<sup>1661</sup> - Fix CircleCI config for modules
- PR #3830<sup>1662</sup> - minor fix: option HPX\_WITH\_TEST was not working correctly
- PR #3828<sup>1663</sup> - Avoid for binaries that depend on HPX to directly link against internal modules
- PR #3827<sup>1664</sup> - Adding shortcut for `hpx::get_ptr<>(sync, id)` for a local, non-migratable objects
- PR #3826<sup>1665</sup> - Fix and update modules documentation
- PR #3825<sup>1666</sup> - Updating default APEX version to 2.1.3 with HPX
- PR #3823<sup>1667</sup> - Fix pkgconfig libs handling
- PR #3822<sup>1668</sup> - Change includes in `hpx_wrap.cpp` to more specific includes
- PR #3821<sup>1669</sup> - Disable barrier\_3792 test when networking is disabled
- PR #3820<sup>1670</sup> - Assorted CMake fixes
- PR #3815<sup>1671</sup> - Removing left-over debug output
- PR #3814<sup>1672</sup> - Allow setting default scheduler mode via the configuration database
- PR #3813<sup>1673</sup> - Make the deprecation warnings issued by the old pp headers optional
- PR #3812<sup>1674</sup> - Windows requires to handle symlinks to directories differently from those linking files

- PR #3811<sup>1675</sup> - Clean up PP module and library skeleton
- PR #3806<sup>1676</sup> - Moving include path configuration to before APEX
- PR #3804<sup>1677</sup> - Fix latch
- PR #3803<sup>1678</sup> - Update hpxcxx to look at lib64 and use python3
- PR #3802<sup>1679</sup> - Numa binding allocator
- PR #3801<sup>1680</sup> - Remove duplicated includes
- PR #3800<sup>1681</sup> - Attempt to fix Posix context switching after lazy init changes
- PR #3798<sup>1682</sup> - count and count\_if accepts different iterator types
- PR #3797<sup>1683</sup> - Adding a couple of `override` keywords to overloaded virtual functions
- PR #3796<sup>1684</sup> - Re-enable testing all schedulers in `shutdown_suspended_test`
- PR #3795<sup>1685</sup> - Change `std::terminate` to `std::abort` in SIGSEGV handler
- PR #3794<sup>1686</sup> - Fixing #3792
- PR #3793<sup>1687</sup> - Extending `migrate_polymorphic_component` unit test
- PR #3791<sup>1688</sup> - Change `throw()` to `noexcept`
- PR #3790<sup>1689</sup> - Remove deprecated options for 1.3.0 release
- PR #3789<sup>1690</sup> - Remove Boost filesystem compatibility header
- PR #3788<sup>1691</sup> - Disabled even more spots that should not execute if networking is disabled
- PR #3787<sup>1692</sup> - Bump minimal boost supported version to 1.61.0
- PR #3786<sup>1693</sup> - Bump minimum required versions for 1.3.0 release
- PR #3785<sup>1694</sup> - Explicitly set number of jobs for all ninja invocations on CircleCI
- PR #3784<sup>1695</sup> - Fix leak and address sanitizer problems
- PR #3783<sup>1696</sup> - Disabled even more spots that should not execute if networking is disabled
- PR #3782<sup>1697</sup> - Cherry-picked tuple and `thread_init_data` fixes from #3701

- PR #3781<sup>1698</sup> - Fix generic context coroutines after lazy stack allocation changes
- PR #3780<sup>1699</sup> - Rename hello world examples
- PR #3776<sup>1700</sup> - Sort algorithms now use the supplied chunker to determine the required minimal chunk size
- PR #3775<sup>1701</sup> - Disable Boost auto-linking
- PR #3774<sup>1702</sup> - Tag and push stable builds
- PR #3773<sup>1703</sup> - Enable migration of polymorphic components
- PR #3771<sup>1704</sup> - Fix link to stackoverflow in documentation
- PR #3770<sup>1705</sup> - Replacing constexpr if in brace-serialization code
- PR #3769<sup>1706</sup> - Fix SIGSEGV handler
- PR #3768<sup>1707</sup> - Adding flags to scheduler allowing to control thread stealing and idle back-off
- PR #3767<sup>1708</sup> - Fix help formatting in hpxrun.py
- PR #3765<sup>1709</sup> - Fix a couple of bugs in the thread test
- PR #3764<sup>1710</sup> - Workaround for SFINAE regression in msvc14.2
- PR #3762<sup>1711</sup> - Prevent MSVC from prematurely instantiating things
- PR #3761<sup>1712</sup> - Update python scripts to work with python 3
- PR #3760<sup>1713</sup> - Fix callable vtable for GCC4.9
- PR #3759<sup>1714</sup> - Rename PAGE\_SIZE to PAGE\_SIZE\_ because AppleClang
- PR #3755<sup>1715</sup> - Making sure locks are not held during suspension
- PR #3754<sup>1716</sup> - Disable more code if networking is not available/not enabled
- PR #3752<sup>1717</sup> - Move util::format implementation to source file
- PR #3751<sup>1718</sup> - Fixing problems with lcos::barrier and iostreams
- PR #3750<sup>1719</sup> - Change error message to take into account use\_guard\_page setting
- PR #3749<sup>1720</sup> - Fix lifetime problem in run\_as\_hpx\_thread

- PR #3748<sup>1721</sup> - Fixed unusable behavior of the clang code analyzer.
- PR #3747<sup>1722</sup> - Added PMIX\_RANK to the defaults of HPX\_WITH\_PARCELPORT\_MPI\_ENV.
- PR #3745<sup>1723</sup> - Introduced cache\_aligned\_data and cache\_line\_data helper structure
- PR #3742<sup>1724</sup> - Remove more unused functionality from util/logging
- PR #3740<sup>1725</sup> - Fix includes in partitioned vector tests
- PR #3739<sup>1726</sup> - More fixes to make sure that std::flush really flushes all output
- PR #3737<sup>1727</sup> - Fix potential shutdown problems
- PR #3736<sup>1728</sup> - Fix guided\_pool\_executor after dataflow changes caused compilation fail
- PR #3734<sup>1729</sup> - Limiting executor
- PR #3732<sup>1730</sup> - More constrained bound constructors
- PR #3730<sup>1731</sup> - Attempt to fix deadlocks during component loading
- PR #3729<sup>1732</sup> - Add latch member function count\_up and reset, requested by hpxMP
- PR #3728<sup>1733</sup> - Send even empty buffers on hpx::endl and hpx::flush
- PR #3727<sup>1734</sup> - Adding example demonstrating how to customize the memory management for a component
- PR #3726<sup>1735</sup> - Adding support for passing command line options through the HPX\_COMMANDLINE\_OPTIONS environment variable
- PR #3722<sup>1736</sup> - Document known broken OpenMPI builds
- PR #3716<sup>1737</sup> - Add barrier reset function, requested by hpxMP for reusing barrier
- PR #3715<sup>1738</sup> - More work on functions and vtables
- PR #3714<sup>1739</sup> - Generate single-page HTML, PDF, manpage from documentation
- PR #3713<sup>1740</sup> - Updating default APEX version to 2.1.2
- PR #3712<sup>1741</sup> - Update release procedure
- PR #3710<sup>1742</sup> - Fix the C++11 build, after #3704
- PR #3709<sup>1743</sup> - Move some component\_registry functionality to source file

<sup>1743</sup> <https://github.com/STELLAR-GROUP/hpx/pull/3709>

- PR #3708<sup>1744</sup> - Ignore all locks while handling assertions
- PR #3707<sup>1745</sup> - Remove obsolete hpx runtime executable
- PR #3705<sup>1746</sup> - Fix and simplify `make_ready_future` overload sets
- PR #3704<sup>1747</sup> - Reduce use of binders
- PR #3703<sup>1748</sup> - Ini
- PR #3702<sup>1749</sup> - Fixing CUDA compiler errors
- PR #3700<sup>1750</sup> - Added `barrier::increment` function to increase total number of thread
- PR #3697<sup>1751</sup> - One more attempt to fix migration...
- PR #3694<sup>1752</sup> - Fixing component migration
- PR #3693<sup>1753</sup> - Print thread state when getting disallowed value in `set_thread_state`
- PR #3692<sup>1754</sup> - Only disable `constexpr` with clang-cuda, not nvcc+gcc
- PR #3691<sup>1755</sup> - Link with `libspsc++` if needed for `thread_local`
- PR #3690<sup>1756</sup> - Remove thousands separators in `set_operations_3442` to comply with C++11
- PR #3688<sup>1757</sup> - Decouple serialization from function vtables
- PR #3687<sup>1758</sup> - Fix a couple of test failures
- PR #3686<sup>1759</sup> - Make sure tests.unit.build are run after install on CircleCI
- PR #3685<sup>1760</sup> - Revise quickstart CMakeLists.txt explanation
- PR #3684<sup>1761</sup> - Provide concept emulation for Ranges-TS concepts
- PR #3683<sup>1762</sup> - Ignore uninitialized chunks
- PR #3682<sup>1763</sup> - Ignore uninitialized chunks. Check proper indices.
- PR #3680<sup>1764</sup> - Ignore uninitialized chunks. Check proper range indices
- PR #3679<sup>1765</sup> - Simplify basic action implementations
- PR #3678<sup>1766</sup> - Making sure `HPX_HAVE_LIBATOMIC` is unset before checking

## 2.10.9 HPX V1.2.1 (Feb 19, 2019)

### General changes

This is a bugfix release. It contains the following changes:

- Fix compilation on ARM, s390x and 32-bit architectures.
- Fix a critical bug in the future implementation.
- Fix several problems in the CMake configuration which affects external projects.

## 2.10.10 HPX V1.2.0 (Nov 12, 2018)

### General changes

Here are some of the main highlights and changes for this release:

- Thanks to the work of our Google Summer of Code student, Nikunj Gupta, we now have a new implementation of `hpx_main.hpp` on supported platforms (Linux, BSD and MacOS). This is intended to be a less fragile drop-in replacement for the old implementation relying on preprocessor macros. The new implementation does not require changes if you are using the [CMake<sup>1872</sup>](#) or `pkg-config`. The old behaviour can be restored by setting `HPX_WITH_DYNAMIC_HPX_MAIN=OFF` during [CMake<sup>1873</sup>](#) configuration. The implementation on Windows is unchanged.
- We have added functionality to allow passing scheduling hints to our schedulers. These will allow us to create executors that for example target a specific NUMA domain or allow for *HPX* threads to be pinned to a particular worker thread.
- We have significantly improved the performance of our futures implementation by making the shared state atomic.
- We have replaced Boostbook by Sphinx for our documentation. This means the documentation is easier to navigate with built-in search and table of contents. We have also added a quick start section and restructured the documentation to be easier to follow for new users.
- We have added a new option to the `--hpx:threads` command line option. It is now possible to use `cores` to tell *HPX* to only use one worker thread per core, unlike the existing option `all` which uses one worker thread per processing unit (processing unit can be a hyperthread if hyperthreads are available). The default value of `--hpx:threads` has also been changed to `cores` as this leads to better performance in most cases.
- All command line options can now be passed alongside configuration options when initializing *HPX*. This means that some options that were previously only available on the command line can now be set as configuration options.
- *HPXMP* is a portable, scalable, and flexible application programming interface using the OpenMP specification that supports multi-platform shared memory multiprocessing programming in C and C++. *HPXMP* can be enabled within *HPX* by setting `DHPX_WITH_HPXMP=ON` during [CMake<sup>1874</sup>](#) configuration.
- Two new performance counters were added for measuring the time spent doing background work. `/threads/time/background-work-duration` returns the time spent doing background on a given thread or locality, while `/threads/time/background-overhead` returns the fraction of time spent doing background work with respect to the overall time spent running the scheduler. The new performance counters are disabled by default and can be turned on by setting `HPX_WITH_BACKGROUND_THREAD_COUNTERS=ON` during [CMake<sup>1875</sup>](#) configuration.
- The idling behaviour of *HPX* has been tweaked to allow for faster idling. This is useful in interactive applications where the *HPX* worker threads may not have work all the time. This behaviour can be tweaked and turned off as before with `HPX_WITH_THREAD_MANAGER_IDLE_BACKOFF=OFF` during [CMake<sup>1876</sup>](#) configuration.
- It is now possible to register callback functions for *HPX* worker thread events. Callbacks can be registered for starting and stopping worker threads, and for when errors occur.

<sup>1872</sup> <https://www.cmake.org>

<sup>1873</sup> <https://www.cmake.org>

<sup>1874</sup> <https://www.cmake.org>

<sup>1875</sup> <https://www.cmake.org>

<sup>1876</sup> <https://www.cmake.org>

## Breaking changes

- The implementation of `hpx_main.hpp` has changed. If you are using custom Makefiles you will need to make changes. Please see the documentation on *using Makefiles* for more details.
- The default value of `--hpx:threads` has changed from `all` to `cores`. The new option `cores` only starts one worker thread per core.
- We have dropped support for Boost 1.56 and 1.57. The minimal version of Boost we now test is 1.58.
- Our `boost::format`-based formatting implementation has been revised and replaced with a custom implementation. This changes the formatting syntax and requires changes if you are relying on `hpx::util::format` or `hpx::util::format_to`. The pull request for this change contains more information: [PR #3266](#)<sup>1877</sup>.
- The following deprecated options have now been completely removed: `HPX_WITH_ASYNC_FUNCTION_COMPATIBILITY`, `HPX_WITH_LOCAL_DATAFLOW`, `HPX_WITH_GENERIC_EXECUTION_POLICY`, `HPX_WITH_BOOST_CHRONO_COMPATIBILITY`, `HPX_WITH_EXECUTOR_COMPATIBILITY`, `HPX_WITH_EXECUTION_POLICY_COMPATIBILITY`, and `HPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY`.

- PR #3389<sup>2028</sup> - Fix deadlock during shutdown
- PR #3388<sup>2029</sup> - Add several functionalities allowing to optimize synchronous action invocation
- PR #3387<sup>2030</sup> - Add cmake option to opt out of fail-compile tests
- PR #3386<sup>2031</sup> - Adding support for boost::container::small\_vector to dataflow
- PR #3385<sup>2032</sup> - Adds Debug option for hpx initializing from main
- PR #3384<sup>2033</sup> - This hopefully fixes two tests that occasionally fail
- PR #3383<sup>2034</sup> - Making sure thread local storage is enable for hpxMP
- PR #3382<sup>2035</sup> - Fix usage of HPX\_CAPTURE together with default value capture [=]
- PR #3381<sup>2036</sup> - Replace undefined instantiations of uniform\_int\_distribution
- PR #3380<sup>2037</sup> - Add missing semicolons to uses of HPX\_COMPILER\_FENCE
- PR #3379<sup>2038</sup> - Fixing #3378
- PR #3377<sup>2039</sup> - Adding build system support to integrate hpxmp into hpx at the user's machine
- PR #3375<sup>2040</sup> - Replacing wrapper for \_\_libc\_start\_main with main
- PR #3374<sup>2041</sup> - Adds hpx\_wrap to HPX\_LINK\_LIBRARIES which links only when specified.
- PR #3373<sup>2042</sup> - Forcing cache settings in HPXConfig.cmake to guarantee updated values
- PR #3372<sup>2043</sup> - Fix some more c++11 build problems
- PR #3371<sup>2044</sup> - Adds HPX\_LINKER\_FLAGS to HPX applications without editing their source codes
- PR #3370<sup>2045</sup> - util::format: add typeSpecifier<> specializations for %!s(MISSING) and %!!(MISSING)s
- PR #3369<sup>2046</sup> - Adding configuration option to allow explicit disable of the new hpx\_main feature on Linux
- PR #3368<sup>2047</sup> - Updates doc with recent hpx\_wrap implementation
- PR #3367<sup>2048</sup> - Adds Mac OS implementation to hpx\_main.hpp
- PR #3365<sup>2049</sup> - Fix order of hpx libs in HPX\_CONF\_LIBRARIES.
- PR #3363<sup>2050</sup> - Apex fixing null wrapper

- PR #3036<sup>2133</sup> - Switching to CircleCI 2.0

## 2.10.11 HPX V1.1.0 (Mar 24, 2018)

### General changes

Here are some of the main highlights and changes for this release (in no particular order):

- We have changed the way *HPX* manages the processing units on a node. We do not longer implicitly bind all available cores to a single thread pool. The user has now full control over what processing units are bound to what thread pool, each with a separate scheduler. It is now also possible to create your own scheduler implementation and control what processing units this scheduler should use. We added the `hpx::resource::partitioner` that manages all available processing units and assigns resources to the used thread pools. Thread pools can be now be suspended/resumed independently. This functionality helps in running *HPX* concurrently to code that is directly relying on OpenMP<sup>2134</sup> and/or MPI<sup>2135</sup>.
- We have continued to implement various parallel algorithms. *HPX* now almost completely implements all of the parallel algorithms as specified by the C++17 Standard<sup>2136</sup>. We have also continued to implement these algorithms for the distributed use case (for segmented data structures, such as `hpx::partitioned_vector`).

<sup>2133</sup> <https://github.com/STELLAR-GROUP/hpx/pull/3036>

<sup>2134</sup> <https://openmp.org/wp/>

<sup>2135</sup> [https://en.wikipedia.org/wiki/Message\\_Passing\\_Interface](https://en.wikipedia.org/wiki/Message_Passing_Interface)

<sup>2136</sup> <http://www.open-std.org/jtc1/sc22/wg21>

- Added a compatibility layer for `std::thread`, `std::mutex`, and `std::condition_variable` allowing for the code to use those facilities where available and to fall back to the corresponding Boost facilities otherwise. The CMake<sup>2137</sup> configuration option `-DHPX_WITH_THREAD_COMPATIBILITY=On` can be used to force using the Boost equivalents.
- The parameter sequence for the `hpx::parallel::transform_inclusive_scan` overload taking one iterator range has changed (again) to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake<sup>2138</sup>.
- The parameter sequence for the `hpx::parallel::inclusive_scan` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY=On` to CMake.
- Added a helper facility `hpx::local_new` which is equivalent to `hpx::new_` except that it creates components locally only. As a consequence, the used component constructor may accept non-serializable argument types and/or non-const references or pointers.
- Removed the (broken) component type `hpx::lcos::queue<T>`. The old type is still available at configure time by passing `-DHPX_WITH_QUEUE_COMPATIBILITY=On` to CMake.
- The parallel algorithms adopted for C++17 restrict the iterator categories usable with those to at least forward iterators. Our implementation of the parallel algorithms was supporting input iterators (and output iterators) as well by simply falling back to sequential execution. We have now made our implementations conforming by requiring at least forward iterators. In order to enable the old behavior use the compatibility option `-DHPX_WITH_ALGORITHM_INPUT_ITERATOR_SUPPORT=On` on the CMake<sup>2139</sup> command line.
- We have added the functionalities allowing for LCOs being implemented using (simple) components. Before LCOs had to always be implemented using managed components.
- User defined components don't have to be default-constructible anymore. Return types from actions don't have to be default-constructible anymore either. Our serialization layer now in general supports non-default-constructible types.
- We have added a new launch policy `hpx::launch::lazy` that allows one to defer the decision on what launch policy to use to the point of execution. This policy is initialized with a function (object) that – when invoked – is expected to produce the desired launch policy.

## Breaking changes

- We have dropped support for the gcc compiler version V4.8. The minimal gcc version we now test on is gcc V4.9. The minimally required version of CMake<sup>2140</sup> is now V3.3.2.
- We have dropped support for the Visual Studio 2013 compiler version. The minimal Visual Studio version we now test on is Visual Studio 2015.5.
- We have dropped support for the Boost V1.51-V1.54. The minimal version of Boost we now test is Boost V1.55.
- We have dropped support for the `hpx::util::unwrapped` API. `hpx::util::unwrapped` will stay functional to some degree, until it finally gets removed in a later version of HPX. The functional usage of `hpx::util::unwrapped` should be changed to the new `hpx::util::unwrapping` function whereas the immediate usage should be replaced to `hpx::util::unwrap`.

<sup>2137</sup> <https://www.cmake.org>

<sup>2138</sup> <https://www.cmake.org>

<sup>2139</sup> <https://www.cmake.org>

<sup>2140</sup> <https://www.cmake.org>

- The performance counter names referring to properties as exposed by the threading subsystem have changes as those now additionally have to specify the thread-pool. See the corresponding documentation for more details.
- The overloads of `hpx::async` that invoke an action do not perform implicit unwrapping of the returned future anymore in case the invoked function does return a future in the first place. In this case `hpx::async` now returns a `hpx::future<future<T>>` making its behavior conforming to its local counterpart.
- We have replaced the use of `boost::exception_ptr` in our APIs with the equivalent `std::exception_ptr`. Please change your codes accordingly. No compatibility settings are provided.
- We have removed the compatibility settings for `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` as their life-cycle has reached its end.
- We have removed the experimental thread schedulers `hierarchy_scheduler`, `periodic_priority_scheduler` and `throttling_scheduler` in an effort to clean up and consolidate our thread schedulers.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #3250<sup>2141</sup> - Apex refactoring with guids
- PR #3249<sup>2142</sup> - Updating People.qbk
- PR #3246<sup>2143</sup> - Assorted fixes for CUDA
- PR #3245<sup>2144</sup> - Apex refactoring with guids
- PR #3242<sup>2145</sup> - Modify task counting in `thread_queue.hpp`
- PR #3240<sup>2146</sup> - Fixed typos
- PR #3238<sup>2147</sup> - Readding accidentally removed `std::abort`
- PR #3237<sup>2148</sup> - Adding Pipeline example
- PR #3236<sup>2149</sup> - Fixing `memory_block`
- PR #3233<sup>2150</sup> - Make `schedule_thread` take suspended threads into account
- Issue #3226<sup>2151</sup> - `memory_block` is breaking, signaling SIGSEGV on a thread on creation and freeing
- PR #3225<sup>2152</sup> - Applying quick fix for hwloc-2.0
- Issue #3224<sup>2153</sup> - HPX counters crashing the application
- PR #3223<sup>2154</sup> - Fix returns when setting config entries
- Issue #3222<sup>2155</sup> - Errors linking `libhpx.so`

- Issue #3221<sup>2156</sup> - HPX on Mac OS X with HWLoc 2.0.0 fails to run
- PR #3216<sup>2157</sup> - Reorder a variadic array to satisfy VS 2017 15.6
- PR #3214<sup>2158</sup> - Changed prerequisites.qbk to avoid confusion while building boost
- PR #3213<sup>2159</sup> - Relax locks for thread suspension to avoid holding locks when yielding
- PR #3212<sup>2160</sup> - Fix check in sequenced\_executor test
- PR #3211<sup>2161</sup> - Use preinit\_array to set argc/argv in init\_globally example
- PR #3210<sup>2162</sup> - Adapted parallel::{search | search\_n} for Ranges TS (see #1668)
- PR #3209<sup>2163</sup> - Fix locking problems during shutdown
- Issue #3208<sup>2164</sup> - init\_globally throwing a run-time error
- PR #3206<sup>2165</sup> - Addition of new arithmetic performance counter “Count”
- PR #3205<sup>2166</sup> - Fixing return type calculation for bulk\_then\_execute
- PR #3204<sup>2167</sup> - Changing std::rand() to a better inbuilt PRNG generator
- PR #3203<sup>2168</sup> - Resolving problems during shutdown for VS2015
- PR #3202<sup>2169</sup> - Making sure resource partitioner is not accessed if its not valid
- PR #3201<sup>2170</sup> - Fixing optional::swap
- Issue #3200<sup>2171</sup> - hpx::util::optional fails
- PR #3199<sup>2172</sup> - Fix sliding\_semaphore test
- PR #3198<sup>2173</sup> - Set pre\_main status before launching run\_helper
- PR #3197<sup>2174</sup> - Update README.rst
- PR #3194<sup>2175</sup> - parallel::{fill|fill\_n} updated for Ranges TS
- PR #3193<sup>2176</sup> - Updating Runtime.cpp by adding correct description of Performance counters during register
- PR #3191<sup>2177</sup> - Fix sliding\_semaphore\_2338 test
- PR #3190<sup>2178</sup> - Topology improvements

- PR #3189<sup>2179</sup> - Deleting one include of median from BOOST library to arithmetics\_counter file
- PR #3188<sup>2180</sup> - Optionally disable printing of diagnostics during terminate
- PR #3187<sup>2181</sup> - Suppressing cmake warning issued by cmake > V3.11
- PR #3185<sup>2182</sup> - Remove unused scoped\_unlock, unlock\_guard\_try
- PR #3184<sup>2183</sup> - Fix nqueen example
- PR #3183<sup>2184</sup> - Add runtime start/stop, resume/suspend and OpenMP benchmarks
- Issue #3182<sup>2185</sup> - bulk\_then\_execute has unexpected return type/does not compile
- Issue #3181<sup>2186</sup> - hwloc 2.0 breaks topo class and cannot be used
- Issue #3180<sup>2187</sup> - Schedulers that don't support suspend/resume are unusable
- PR #3179<sup>2188</sup> - Various minor changes to support FLeCSI
- PR #3178<sup>2189</sup> - Fix #3124
- PR #3177<sup>2190</sup> - Removed allgather
- PR #3176<sup>2191</sup> - Fixed Documentation for "using\_hpx\_pkgconfig"
- PR #3174<sup>2192</sup> - Add hpx::iostreams::ostream overload to format\_to
- PR #3172<sup>2193</sup> - Fix lifo queue backend
- PR #3171<sup>2194</sup> - adding the missing unset() function to cpu\_mask() for case of more than 64 threads
- PR #3170<sup>2195</sup> - Add cmake flag -DHPX\_WITHFAULT\_TOLERANCE=ON (OFF by default)
- PR #3169<sup>2196</sup> - Adapted parallel::{countlcount\_if} for Ranges TS (see #1668)
- PR #3168<sup>2197</sup> - Changing used namespace for seq execution policy
- Issue #3167<sup>2198</sup> - Update GSoC projects
- Issue #3166<sup>2199</sup> - Application (Octotiger) gets stuck on hpx::finalize when only using one thread
- Issue #3165<sup>2200</sup> - Compilation of parallel algorithms with HPX\_WITH\_DATAPAR is broken
- PR #3164<sup>2201</sup> - Fixing component migration

- PR #3162<sup>2202</sup> - regex\_from\_pattern: escape regex special characters to avoid misinterpretation
- Issue #3161<sup>2203</sup> - Building HPX with hwloc 2.0.0 fails
- PR #3160<sup>2204</sup> - Fixing the handling of quoted command line arguments.
- PR #3158<sup>2205</sup> - Fixing a race with timed suspension (second attempt)
- PR #3157<sup>2206</sup> - Revert “Fixing a race with timed suspension”
- PR #3156<sup>2207</sup> - Fixing serialization of classes with incompatible serialize signature
- PR #3154<sup>2208</sup> - More refactorings based on clang-tidy reports
- PR #3153<sup>2209</sup> - Fixing a race with timed suspension
- PR #3152<sup>2210</sup> - Documentation for runtime suspension
- PR #3151<sup>2211</sup> - Use small\_vector only from boost version 1.59 onwards
- PR #3150<sup>2212</sup> - Avoiding more stack overflows
- PR #3148<sup>2213</sup> - Refactoring component\_base and base\_action/transfer\_base\_action
- PR #3147<sup>2214</sup> - Move yield\_while out of detail namespace and into own file
- PR #3145<sup>2215</sup> - Remove a leftover of the cxx11 std array cleanup
- PR #3144<sup>2216</sup> - Minor changes to how actions are executed
- PR #3143<sup>2217</sup> - Fix stack overhead
- PR #3142<sup>2218</sup> - Fix typo in config.hpp
- PR #3141<sup>2219</sup> - Fixing small\_vector compatibility with older boost version
- PR #3140<sup>2220</sup> - is\_heap\_text fix
- Issue #3139<sup>2221</sup> - Error in is\_heap\_tests.hpp
- PR #3138<sup>2222</sup> - Partially reverting #3126
- PR #3137<sup>2223</sup> - Suspend speedup
- PR #3136<sup>2224</sup> - Revert “Fixing #2325”

- PR #3135<sup>2225</sup> - Improving destruction of threads
- Issue #3134<sup>2226</sup> - HPX\_SERIALIZATION\_SPLIT\_FREE does not stop compiler from looking for serialize() method
- PR #3133<sup>2227</sup> - Make hwloc compulsory
- PR #3132<sup>2228</sup> - Update CXX14 constexpr feature test
- PR #3131<sup>2229</sup> - Fixing #2325
- PR #3130<sup>2230</sup> - Avoid completion handler allocation
- PR #3129<sup>2231</sup> - Suspend runtime
- PR #3128<sup>2232</sup> - Make docbook dtd and xsl path names consistent
- PR #3127<sup>2233</sup> - Add hpx::start nullptr overloads
- PR #3126<sup>2234</sup> - Cleaning up coroutine implementation
- PR #3125<sup>2235</sup> - Replacing nullptr with hpx::threads::invalid\_thread\_id
- Issue #3124<sup>2236</sup> - Add hello\_world\_component to CI builds
- PR #3123<sup>2237</sup> - Add new constructor.
- PR #3122<sup>2238</sup> - Fixing #3121
- Issue #3121<sup>2239</sup> - HPX\_SMT\_PAUSE is broken on non-x86 platforms when \_\_GNUC\_\_ is defined
- PR #3120<sup>2240</sup> - Don't use boost::intrusive\_ptr for thread\_id\_type
- PR #3119<sup>2241</sup> - Disable default executor compatibility with V1 executors
- PR #3118<sup>2242</sup> - Adding performance\_counter::reinit to allow for dynamically changing counter sets
- PR #3117<sup>2243</sup> - Replace uses of boost/experimental::optional with util::optional
- PR #3116<sup>2244</sup> - Moving background thread APEX timer #2980
- PR #3115<sup>2245</sup> - Fixing race condition in channel test
- PR #3114<sup>2246</sup> - Avoid using util::function for thread function wrappers
- PR #3113<sup>2247</sup> - cmake V3.10.2 has changed the variable names used for MPI

- PR #3112<sup>2248</sup> - Minor fixes to exclusive\_scan algorithm
- PR #3111<sup>2249</sup> - Revert “fix detection of cxx11\_std\_atomic”
- PR #3110<sup>2250</sup> - Suspend thread pool
- PR #3109<sup>2251</sup> - Fixing thread scheduling when yielding a thread id
- PR #3108<sup>2252</sup> - Revert “Suspend thread pool”
- PR #3107<sup>2253</sup> - Remove UB from thread::id relational operators
- PR #3106<sup>2254</sup> - Add cmake test for std::decay\_t to fix cuda build
- PR #3105<sup>2255</sup> - Fixing refcount for async traversal frame
- PR #3104<sup>2256</sup> - Local execution of direct actions is now actually performed directly
- PR #3103<sup>2257</sup> - Adding support for generic counter\_raw\_values performance counter type
- Issue #3102<sup>2258</sup> - Introduce generic performance counter type returning an array of values
- PR #3101<sup>2259</sup> - Revert “Adapting stack overhead limit for gcc 4.9”
- PR #3100<sup>2260</sup> - Fix #3068 (condition\_variable deadlock)
- PR #3099<sup>2261</sup> - Fixing lock held during suspension in papi counter component
- PR #3098<sup>2262</sup> - Unbreak broadcast\_wait\_for\_2822 test
- PR #3097<sup>2263</sup> - Adapting stack overhead limit for gcc 4.9
- PR #3096<sup>2264</sup> - fix detection of cxx11\_std\_atomic
- PR #3095<sup>2265</sup> - Add ciso646 header to get \_LIBCPP\_VERSION for testing inplace merge
- PR #3094<sup>2266</sup> - Relax atomic operations on performance counter values
- PR #3093<sup>2267</sup> - Short-circuit all\_of/any\_of/none\_of instantiations
- PR #3092<sup>2268</sup> - Take advantage of C++14 lambda capture initialization syntax, where possible
- PR #3091<sup>2269</sup> - Remove more references to Boost from logging code
- PR #3090<sup>2270</sup> - Unify use of yield/yield\_k

- PR #3089<sup>2271</sup> - Fix a strange thing in parallel::detail::handle\_exception. (Fix #2834.)
- Issue #3088<sup>2272</sup> - A strange thing in parallel::sort.
- PR #3087<sup>2273</sup> - Fixing assertion in default\_distribution\_policy
- PR #3086<sup>2274</sup> - Implement parallel::remove and parallel::remove\_if
- PR #3085<sup>2275</sup> - Addressing breaking changes in Boost V1.66
- PR #3084<sup>2276</sup> - Ignore build warnings round 2
- PR #3083<sup>2277</sup> - Fix typo HPX\_WITH\_MM\_PREFECHT
- PR #3081<sup>2278</sup> - Pre-decay template arguments early
- PR #3080<sup>2279</sup> - Suspend thread pool
- PR #3079<sup>2280</sup> - Ignore build warnings
- PR #3078<sup>2281</sup> - Don't test inplace\_merge with libc++
- PR #3076<sup>2282</sup> - Fixing 3075: Part 1
- PR #3074<sup>2283</sup> - Fix more build warnings
- PR #3073<sup>2284</sup> - Suspend thread cleanup
- PR #3072<sup>2285</sup> - Change existing symbol\_namespace::iterate to return all data instead of invoking a callback
- PR #3071<sup>2286</sup> - Fixing pack\_traversal\_async test
- PR #3070<sup>2287</sup> - Fix dynamic\_counters\_loaded\_1508 test by adding dependency to memory\_component
- PR #3069<sup>2288</sup> - Fix scheduling loop exit
- Issue #3068<sup>2289</sup> - hpx::lcos::condition\_variable could be suspect to deadlocks
- PR #3067<sup>2290</sup> - #ifdef out random\_shuffle deprecated in later c++
- PR #3066<sup>2291</sup> - Make coalescing test depend on coalescing library to ensure it gets built
- PR #3065<sup>2292</sup> - Workaround for minimal\_timed\_async\_executor\_test compilation failures, attempts to copy a deferred call (in unevaluated context)
- PR #3064<sup>2293</sup> - Fixing wrong condition in wrapper\_heap

## 2.10.12 HPX V1.0.0 (Apr 24, 2017)

### General changes

Here are some of the main highlights and changes for this release (in no particular order):

- Added the facility `hpx::split_future` which allows one to convert a `future<tuple<Ts...>>` into a `tuple<future<Ts>...>`. This functionality is not available when compiling *HPX* with VS2012.
- Added a new type of performance counter which allows one to return a list of values for each invocation. We also added a first counter of this type which collects a histogram of the times between parcels being created.
- Added new LCOs: `hpx::lcos::channel` and `hpx::lcos::local::channel` which are very similar to the well known channel constructs used in the Go language.
- Added new performance counters reporting the amount of data handled by the networking layer on a action-by-action basis (please see [PR #2289<sup>2750</sup>](#) for more details).
- Added a new facility `hpx::lcos::barrier`, replacing the equally named older one. The new facility has a slightly changed API and is much more efficient. Most notable, the new facility exposes a (global) function `hpx::lcos::barrier::synchronize()` which represents a global barrier across all localities.
- We have started to add support for vectorization to our parallel algorithm implementations. This support depends on using an external library, currently either Vc Library or [libboost\\_simd](#). Please see [Issue #2333<sup>2751</sup>](#) for a list of currently supported algorithms. This is an experimental feature and its implementation and/or API might change in the future. Please see this [blog-post<sup>2752</sup>](#) for more information.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overload can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17. The old `inner_product` names can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- Added versions of `hpx::get_ptr` taking client side representations for component instances as their parameter (instead of a global id).
- Added the helper utility `hpx::performance_counters::performance_counter_set` helping to encapsulate a set of performance counters to be managed concurrently.
- All execution policies and related classes have been renamed to be consistent with the naming changes applied for C++17. All policies now live in the namespace `hpx::parallel::execution`. The old names can be still enabled at configure time by specifying `-DHPX_WITH_EXECUTION_POLICY_COMPATIBILITY=On` to CMake.
- The thread scheduling subsystem has undergone a major refactoring which results in significant performance improvements. We have also improved the performance of creating `hpx::future` and of various facilities handling those.
- We have consolidated all of the code in `HPX.Compute` related to the integration of CUDA. `hpx::partitioned_vector` has been enabled to be usable with `hpx::compute::vector` which allows one to place the partitions on one or more GPU devices.
- Added new performance counters exposing various internals of the thread scheduling subsystem, such as the current idle- and busy-loop counters and instantaneous scheduler utilization.

<sup>2750</sup> <https://github.com/STELLAR-GROUP/hpx/pull/2289>

<sup>2751</sup> <https://github.com/STELLAR-GROUP/hpx/issues/2333>

<sup>2752</sup> <http://stellar-group.org/2016/09/vectorized-cpp-parallel-algorithms-with-hpx/>

- Extended and improved the use of the ITTNotify hooks allowing to collect performance counter data and function annotation information from within the Intel Amplifier tool.

## Breaking changes

- We have dropped support for the gcc compiler versions V4.6 and 4.7. The minimal gcc version we now test on is gcc V4.8.
- We have removed (default) support for `boost::chrono` in interfaces, uses of it have been replaced with `std::chrono`. This facility can be still enabled at configure time by specifying `-DHPX_WITH_BOOST_CHRONO_COMPATIBILITY=On` to CMake.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17.
- the build options `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` are now disabled by default. Please change your code still depending on the deprecated interfaces.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #2596<sup>2753</sup> - Adding apex data
- PR #2595<sup>2754</sup> - Remove obsolete file
- Issue #2594<sup>2755</sup> - FindOpenCL.cmake mismatch with the official cmake module
- PR #2592<sup>2756</sup> - First attempt to introduce spmd\_block in hpx
- Issue #2591<sup>2757</sup> - Feature request: continuation (then) which does not require the callable object to take a future<R> as parameter
- PR #2588<sup>2758</sup> - Daint fixes
- PR #2587<sup>2759</sup> - Fixing transfer\_(continuation)\_action::schedule
- PR #2585<sup>2760</sup> - Work around MSVC having an ICE when compiling with -Ob2
- PR #2583<sup>2761</sup> - changing 7zip command to 7za in roll\_release.sh
- PR #2582<sup>2762</sup> - First attempt to introduce spmd\_block in hpx
- PR #2581<sup>2763</sup> - Enable annotated function for parallel algorithms

- PR #2553<sup>2787</sup> - Add cmake cuda\_arch option
- PR #2552<sup>2788</sup> - Remove incomplete datapar bindings to libflatarray
- PR #2551<sup>2789</sup> - Rename hwloc\_topology to hwloc\_topology\_info
- PR #2550<sup>2790</sup> - Apex api updates
- PR #2549<sup>2791</sup> - Pre-include defines.hpp to get the macro HPX\_HAVE\_CUDA value
- PR #2548<sup>2792</sup> - Fixing issue with disconnect
- PR #2546<sup>2793</sup> - Some fixes around cuda clang partitioned\_vector example
- PR #2545<sup>2794</sup> - Fix uses of the Vc2 datapar flags; the value, not the type, should be passed to functions
- PR #2542<sup>2795</sup> - Make HPX\_WITH\_MALLOC easier to use
- PR #2541<sup>2796</sup> - avoid recompiles when enabling/disabling examples
- PR #2540<sup>2797</sup> - Fixing usage of target\_link\_libraries()
- PR #2539<sup>2798</sup> - fix RPATH behaviour
- Issue #2538<sup>2799</sup> - HPX\_WITH\_CUDA corrupts compilation flags
- PR #2537<sup>2800</sup> - Add output of a Bazel Skylark extension for paths and compile options
- PR #2536<sup>2801</sup> - Add counter exposing total available memory to Windows as well
- PR #2535<sup>2802</sup> - Remove obsolete support for security
- Issue #2534<sup>2803</sup> - Remove command line option --hpx:run-agas-server
- PR #2533<sup>2804</sup> - Pre-cache locality endpoints during bootstrap
- PR #2532<sup>2805</sup> - Fixing handling of GIDs during serialization preprocessing
- PR #2531<sup>2806</sup> - Amend uses of the term “functor”
- PR #2529<sup>2807</sup> - added counter for reading available memory
- PR #2527<sup>2808</sup> - Facilities to create actions from lambdas
- PR #2526<sup>2809</sup> - Updated docs: HPX\_WITH\_EXAMPLES

- Issue #2500<sup>2833</sup> - nvcc / cuda clang issue due to a missing -DHPX\_WITH\_CUDA flag
- PR #2499<sup>2834</sup> - Adding support for std::array to wait\_all and friends
- PR #2498<sup>2835</sup> - Execute background work as HPX thread
- PR #2497<sup>2836</sup> - Fixing configuration options for spinlock-deadlock detection
- PR #2496<sup>2837</sup> - Accounting for different compilers in CrayKNL toolchain file
- PR #2494<sup>2838</sup> - Adding component base class which ties a component instance to a given executor
- PR #2493<sup>2839</sup> - Enable controlling amount of pending threads which must be available to allow thread stealing
- PR #2492<sup>2840</sup> - Adding new command line option –hpx:print-counter-reset
- PR #2491<sup>2841</sup> - Resolve ambiguities when compiling with APEX
- PR #2490<sup>2842</sup> - Resuming threads waiting on future with higher priority
- Issue #2489<sup>2843</sup> - nvcc issue because -std=c++11 appears twice
- PR #2488<sup>2844</sup> - Adding performance counters exposing the internal idle and busy-loop counters
- PR #2487<sup>2845</sup> - Allowing for plain suspend to reschedule thread right away
- PR #2486<sup>2846</sup> - Only flag HPX code for CUDA if HPX\_WITH\_CUDA is set
- PR #2485<sup>2847</sup> - Making thread-queue parameters runtime-configurable
- PR #2484<sup>2848</sup> - Added atomic counter for parcel-destinations
- PR #2483<sup>2849</sup> - Added priority-queue lifo scheduler
- PR #2482<sup>2850</sup> - Changing scheduler to steal only if more than a minimal number of tasks are available
- PR #2481<sup>2851</sup> - Extending command line option –hpx:print-counter-destination to support value ‘none’
- PR #2479<sup>2852</sup> - Added option to disable signal handler
- PR #2478<sup>2853</sup> - Making sure the sine performance counter module gets loaded only for the corresponding example
- Issue #2477<sup>2854</sup> - Breaking at a throw statement
- PR #2476<sup>2855</sup> - Annotated function

- Issue #475<sup>3075</sup> - Create a means of combining performance counters into querysets

## 2.10.13 HPX V0.9.99 (Jul 15, 2016)

### General changes

As the version number of this release hints, we consider this release to be a preview for the upcoming *HPX* V1.0. All of the functionalities we set out to implement for V1.0 are in place; all of the features we wanted to have exposed are ready. We are very happy with the stability and performance of *HPX* and we would like to present this release to the community in order for us to gather broad feedback before releasing V1.0. We still expect for some minor details to change, but on the whole this release represents what we would like to have in a V1.0.

Overall, since the last release we have had almost 1600 commits while closing almost 400 tickets. These numbers reflect the incredible development activity we have seen over the last couple of months. We would like to express a big ‘Thank you!’ to all contributors and those who helped to make this release happen.

The most notable addition in terms of new functionality available with this release is the full implementation of object migration (i.e. the ability to transparently move *HPX* components to a different compute node). Additionally, this release of *HPX* cleans up many minor issues and some API inconsistencies.

Here are some of the main highlights and changes for this release (in no particular order):

- We have fixed a couple of issues in AGAS and the parcel layer which have caused hangs, segmentation faults at exit, and a slowdown of applications over time. Fixing those has significantly increased the overall stability and performance of distributed runs.

<sup>3070</sup> <https://github.com/STELLAR-GROUP/hpx/issues/1125>

<sup>3071</sup> <https://github.com/STELLAR-GROUP/hpx/issues/839>

3072 <https://github.com/STELLAR-GROUP/hpx/issues/702>3073 <https://github.com/STELLAR-GROUP/hpx/issues/668>3074 <https://github.com/STELLAR-GROUP/hpx/issues/533>3075 <https://github.com/STELLAR-GROUP/hpx/issues/475>

- We have started to add parallel algorithm overloads based on the C++ Extensions for Ranges ([N4560<sup>3076</sup>](#)) proposal. This also includes the addition of projections to the existing algorithms. Please see [Issue #1668<sup>3077</sup>](#) for a list of algorithms which have been adapted to [N4560<sup>3078</sup>](#).
- We have implemented index-based parallel for-loops based on a corresponding standardization proposal ([P0075R1<sup>3079</sup>](#)). Please see [Issue #2016<sup>3080</sup>](#) for a list of available algorithms.
- We have added implementations for more parallel algorithms as proposed for the upcoming C++ 17 Standard. See [Issue #1141<sup>3081</sup>](#) for an overview of which algorithms are available by now.
- We have started to implement a new prototypical functionality with *HPX.Compute* which uniformly exposes some of the higher level APIs to heterogeneous architectures (currently CUDA). This functionality is an early preview and should not be considered stable. It may change considerably in the future.
- We have pervasively added (optional) executor arguments to all API functions which schedule new work. Executors are now used throughout the code base as the main means of executing tasks.
- Added `hpx::make_future<R>(future<T> &&)` allowing to convert a future of any type T into a future of any other type R, either based on default conversion rules of the embedded types or using a given explicit conversion function.
- We finally finished the implementation of transparent migration of components to another locality. It is now possible to trigger a migration operation without ‘stopping the world’ for the object to migrate. *HPX* will make sure that no work is being performed on an object before it is migrated and that all subsequently scheduled work for the migrated object will be transparently forwarded to the new locality. Please note that the global id of the migrated object does not change, thus the application will not have to be changed in any way to support this new functionality. Please note that this feature is currently considered experimental. See [Issue #559<sup>3082</sup>](#) and [PR #1966<sup>3083</sup>](#) for more details.
- The `hpx::dataflow` facility is now usable with actions. Similarly to `hpx::async`, actions can be specified as an explicit template argument (`hpx::dataflow<Action>(target, ...)`) or as the first argument (`hpx::dataflow(Action(), target, ...)`). We have also enabled the use of distribution policies as the target for dataflow invocations. Please see [Issue #1265<sup>3084</sup>](#) and [PR #1912<sup>3085</sup>](#) for more information.
- Adding overloads of `gather_here` and `gather_there` to accept the plain values of the data to gather (in addition to the existing overloads expecting futures).
- We have cleaned up and refactored large parts of the code base. This helped reducing compile and link times of *HPX* itself and also of applications depending on it. We have further decreased the dependency of *HPX* on the Boost libraries by replacing part of those with facilities available from the standard libraries.
- Wherever possible we have removed dependencies of our API on Boost by replacing those with the equivalent facility from the C++11 standard library.
- We have added new performance counters for parcel coalescing, file-IO, the AGAS cache, and overall scheduler time. Resetting performance counters has been overhauled and fixed.
- We have introduced a generic client type `hpx::components::client<>` and added support for using it with `hpx::async`. This removes the necessity to implement specific client types for every component type without losing type safety. This deemphasizes the need for using the low level `hpx::id_type` for referencing

<sup>3076</sup> <http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2015/n4560.pdf>

<sup>3077</sup> <https://github.com/STELLAR-GROUP/hpx/issues/1668>

<sup>3084</sup> <https://github.com/STELLAR-GROUP/hpx/issues/1265>

<sup>3085</sup> <https://github.com/STELLAR-GROUP/hpx/pull/1912>

(possibly remote) component instances. The plan is to deprecate the direct use of `hpx::id_type` in user code in the future.

- We have added a special iterator which supports automatic prefetching of one or more arrays for speeding up loop-like code (see `hpx::parallel::util::make_prefetcher_context()`).
- We have extended the interfaces exposed from executors (as proposed by [N4406<sup>3086</sup>](#)) to accept an arbitrary number of arguments.

## Breaking changes

- In order to move the dataflow facility to namespace `hpx` we added a definition of `hpx::dataflow` which might create ambiguities in existing codes. The previous definition of this facility (`hpx::lcos::local::dataflow`) has been deprecated and is available only if the constant `-DHPX_WITH_LOCAL_DATAFLOW_COMPATIBILITY=On` to [CMake<sup>3087</sup>](#) is defined at configuration time. Please explicitly qualify all uses of the dataflow facility if you enable this compatibility setting and encounter ambiguities.
- The adaptation of the C++ Extensions for Ranges ([N4560<sup>3088</sup>](#)) proposal imposes some breaking changes related to the return types of some of the parallel algorithms. Please see [Issue #1668<sup>3089</sup>](#) for a list of algorithms which have already been adapted.
- The facility `hpx::lcos::make_future_void()` has been replaced by `hpx::make_future<void>()`.
- We have removed support for Intel V13 and gcc 4.4.x.
- We have removed (default) support for the generic `hpx::parallel::execution_policy` because it was removed from the Parallelism TS ([\\_cpp11\\_n4104\\_](#)) while it was being added to the upcoming C++17 Standard. This facility can be still enabled at configure time by specifying `-DHPX_WITH_GENERIC_EXECUTION_POLICY=On` to CMake.
- Uses of `boost::shared_ptr` and related facilities have been replaced with `std::shared_ptr` and friends. Uses of `boost::unique_lock`, `boost::lock_guard` etc. have also been replaced by the equivalent (and equally named) tools available from the C++11 standard library.
- Facilities that used to expect an explicit `boost::unique_lock` now take an `std::unique_lock`. Additionally, `condition_variable` no longer aliases `condition_variable_any`; its interface now only works with `std::unique_lock<local::mutex>`.
- Uses of `boost::function`, `boost::bind`, `boost::tuple` have been replaced by the corresponding facilities in *HPX* (`hpx::util::function`, `hpx::util::bind`, and `hpx::util::tuple`, respectively).

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #2250<sup>3090</sup> - change default chunker of parallel executor to static one
- PR #2247<sup>3091</sup> - HPX on ppc64le
- PR #2244<sup>3092</sup> - Fixing MSVC problems
- PR #2238<sup>3093</sup> - Fixing small typos
- PR #2237<sup>3094</sup> - Fixing small typos
- PR #2234<sup>3095</sup> - Fix broken add test macro when extra args are passed in
- PR #2231<sup>3096</sup> - Fixing possible race during future awaiting in serialization
- PR #2230<sup>3097</sup> - Fix stream nvcc
- PR #2229<sup>3098</sup> - Fixed run\_as\_hpx\_thread
- PR #2228<sup>3099</sup> - On prefetching\_test branch : adding prefetching\_iterator and related tests used for prefetching containers within lambda functions
- PR #2227<sup>3100</sup> - Support for HPXCL's opencl::event
- PR #2226<sup>3101</sup> - Preparing for release of V0.9.99
- PR #2225<sup>3102</sup> - fix issue when compiling components with hpxcxx
- PR #2224<sup>3103</sup> - Compute alloc fix
- PR #2223<sup>3104</sup> - Simplify promise
- PR #2222<sup>3105</sup> - Replace last uses of boost::function by util::function\_nonser
- PR #2221<sup>3106</sup> - Fix config tests
- PR #2220<sup>3107</sup> - Fixing gcc 4.6 compilation issues
- PR #2219<sup>3108</sup> - nullptr support for [unique\_]function
- PR #2218<sup>3109</sup> - Introducing clang tidy
- PR #2216<sup>3110</sup> - Replace NULL with nullptr

- Issue #2214<sup>3111</sup> - Let inspect flag use of NULL, suggest nullptr instead
- PR #2213<sup>3112</sup> - Require support for nullptr
- PR #2212<sup>3113</sup> - Properly find jemalloc through pkg-config
- PR #2211<sup>3114</sup> - Disable a couple of warnings reported by Intel on Windows
- PR #2210<sup>3115</sup> - Fixed host::block\_allocator::bulk\_construct
- PR #2209<sup>3116</sup> - Started to clean up new sort algorithms, made things compile for sort\_by\_key
- PR #2208<sup>3117</sup> - A couple of fixes that were exposed by a new sort algorithm
- PR #2207<sup>3118</sup> - Adding missing includes in /hpx/include/serialization.hpp
- PR #2206<sup>3119</sup> - Call package\_action::get\_future before package\_action::apply
- PR #2205<sup>3120</sup> - The indirect\_packaged\_task::operator() needs to be run on a HPX thread
- PR #2204<sup>3121</sup> - Variadic executor parameters
- PR #2203<sup>3122</sup> - Delay-initialize members of partitioned iterator
- PR #2202<sup>3123</sup> - Added segmented fill for hpx::vector
- Issue #2201<sup>3124</sup> - Null Thread id encountered on partitioned\_vector
- PR #2200<sup>3125</sup> - Fix hangs
- PR #2199<sup>3126</sup> - Deprecating hpx/traits.hpp
- PR #2198<sup>3127</sup> - Making explicit inclusion of external libraries into build
- PR #2197<sup>3128</sup> - Fix typo in QT CMakeLists
- PR #2196<sup>3129</sup> - Fixing a gcc warning about attributes being ignored
- PR #2194<sup>3130</sup> - Fixing partitioned\_vector\_spmd\_foreach example
- Issue #2193<sup>3131</sup> - partitioned\_vector\_spmd\_foreach seg faults
- PR #2192<sup>3132</sup> - Support Boost.Thread v4
- PR #2191<sup>3133</sup> - HPX.Compute prototype

- PR #2190<sup>3134</sup> - Spawning operation on new thread if remaining stack space becomes too small
- PR #2189<sup>3135</sup> - Adding callback taking index and future to when\_each
- PR #2188<sup>3136</sup> - Adding new example demonstrating receive\_buffer
- PR #2187<sup>3137</sup> - Mask 128-bit ints if CUDA is being used
- PR #2186<sup>3138</sup> - Make startup & shutdown functions unique\_function
- PR #2185<sup>3139</sup> - Fixing logging output not to cause hang on shutdown
- PR #2184<sup>3140</sup> - Allowing component clients as action return types
- Issue #2183<sup>3141</sup> - Enabling logging output causes hang on shutdown
- Issue #2182<sup>3142</sup> - 1d\_stencil seg fault
- Issue #2181<sup>3143</sup> - Setting small stack size does not change default
- PR #2180<sup>3144</sup> - Changing default bind mode to balanced
- PR #2179<sup>3145</sup> - adding prefetching\_iterator and related tests used for prefetching containers within lambda functions
- PR #2177<sup>3146</sup> - Fixing 2176
- Issue #2176<sup>3147</sup> - Launch process test fails on OSX
- PR #2175<sup>3148</sup> - Fix unbalanced config/warnings includes, add some new ones
- PR #2174<sup>3149</sup> - Fix test categorization : regression not unit
- Issue #2172<sup>3150</sup> - Different performance results
- Issue #2171<sup>3151</sup> - “negative entry in reference count table” running octotiger on 32 nodes on queenbee
- Issue #2170<sup>3152</sup> - Error while compiling on Mac + boost 1.60
- PR #2168<sup>3153</sup> - Fixing problems with is\_bitwise\_serializable
- Issue #2167<sup>3154</sup> - startup & shutdown function should accept unique\_function
- Issue #2166<sup>3155</sup> - Simple receive\_buffer example
- PR #2165<sup>3156</sup> - Fix wait all

- PR #2164<sup>3157</sup> - Fix wait all
- PR #2163<sup>3158</sup> - Fix some typos in config tests
- PR #2162<sup>3159</sup> - Improve #includes
- PR #2160<sup>3160</sup> - Add inspect check for missing #include <list>
- PR #2159<sup>3161</sup> - Add missing finalize call to stop test hanging
- PR #2158<sup>3162</sup> - Algo fixes
- PR #2157<sup>3163</sup> - Stack check
- Issue #2156<sup>3164</sup> - OSX reports stack space incorrectly (generic context coroutines)
- Issue #2155<sup>3165</sup> - Race condition suspected in runtime
- PR #2154<sup>3166</sup> - Replace boost::detail::atomic\_count with the new util::atomic\_count
- PR #2153<sup>3167</sup> - Fix stack overflow on OSX
- PR #2152<sup>3168</sup> - Define is\_bitwise\_serializable as is\_trivially\_copyable when available
- PR #2151<sup>3169</sup> - Adding missing <cstring> for std::mem\* functions
- Issue #2150<sup>3170</sup> - Unable to use component clients as action return types
- PR #2149<sup>3171</sup> - std::memmove copies bytes, use bytes\* sizeof(type) when copying larger types
- PR #2146<sup>3172</sup> - Adding customization point for parallel copy/move
- PR #2145<sup>3173</sup> - Applying changes to address warnings issued by latest version of PVS Studio
- Issue #2148<sup>3174</sup> - hpx::parallel::copy is broken after trivially copyable changes
- PR #2144<sup>3175</sup> - Some minor tweaks to compute prototype
- PR #2143<sup>3176</sup> - Added Boost version support information over OSX platform
- PR #2142<sup>3177</sup> - Fixing memory leak in example
- PR #2141<sup>3178</sup> - Add missing specializations in execution policies
- PR #2139<sup>3179</sup> - This PR fixes a few problems reported by Clang's Undefined Behavior sanitizer

- PR #2091<sup>3226</sup> - Fix for Raspberry pi build
- PR #2090<sup>3227</sup> - Fix storage size for util::function<>
- PR #2089<sup>3228</sup> - Fix #2088
- Issue #2088<sup>3229</sup> - More verbose output from cmake configuration
- PR #2087<sup>3230</sup> - Making sure init\_globally always executes hpx\_main
- Issue #2086<sup>3231</sup> - Race condition with recent HPX
- PR #2085<sup>3232</sup> - Adding #include checker
- PR #2084<sup>3233</sup> - Replace boost lock types with standard library ones
- PR #2083<sup>3234</sup> - Simplify packaged task
- PR #2082<sup>3235</sup> - Updating APEX version for testing
- PR #2081<sup>3236</sup> - Cleanup exception headers
- PR #2080<sup>3237</sup> - Make call\_once variadic
- Issue #2079<sup>3238</sup> - With GNU C++, line 85 of hpx/config/version.hpp causes link failure when linking application
- Issue #2078<sup>3239</sup> - Simple test fails with \_GLIBCXX\_DEBUG defined
- PR #2077<sup>3240</sup> - Instantiate board in nqueen client
- PR #2076<sup>3241</sup> - Moving coalescing registration to TUs
- PR #2075<sup>3242</sup> - Fixed some documentation typos
- PR #2074<sup>3243</sup> - Adding flush-mode to message handler flush
- PR #2073<sup>3244</sup> - Fixing performance regression introduced lately
- PR #2072<sup>3245</sup> - Refactor local::condition\_variable
- PR #2071<sup>3246</sup> - Timer based on boost::asio::deadline\_timer
- PR #2070<sup>3247</sup> - Refactor tuple based functionality
- PR #2069<sup>3248</sup> - Fixed typos

## 2.10.14 HPX V0.9.11 (Nov 11, 2015)

Our main focus for this release was the design and development of a coherent set of higher-level APIs exposing various types of parallelism to the application programmer. We introduced the concepts of an `executor`, which can be used to customize the `where` and `when` of execution of tasks in the context of parallelizing codes. We extended all APIs related to managing parallel tasks to support executors which gives the user the choice of either using one of the predefined executor types or to provide its own, possibly application specific, executor. We paid very close attention to align all of these changes with the existing C++ Standards documents or with the ongoing proposals for standardization.

This release is the first after our change to a new development policy. We switched all development to be strictly performed on branches only, all direct commits to our main branch (`master`) are prohibited. Any change has to go through a peer review before it will be merged to `master`. As a result the overall stability of our code base has significantly increased, the development process itself has been simplified. This change manifests itself in a large number of pull-requests which have been merged (please see below for a full list of closed issues and pull-requests). All in all for this release, we closed almost 100 issues and merged over 290 pull-requests. There have been over 1600 commits to the `master` branch since the last release.

### General changes

- We are moving into the direction of unifying managed and simple components. As such, the classes `hpx::components::component` and `hpx::components::component_base` have been added which currently just forward to the currently existing simple component facilities. The examples have been converted to only use those two classes.
- Added integration with the [CircleCI](#)<sup>3484</sup> hosted continuous integration service. This gives us constant and immediate feedback on the health of our `master` branch.
- The compiler configuration subsystem in the build system has been reimplemented. Instead of using Boost.Config we now use our own lightweight set of cmake scripts to determine the available language and library features supported by the used compiler.
- The API for creating instances of components has been consolidated. All component instances should be created using the `hpx::new_`. It allows one to instantiate both, single component instances and multiple component instances. The placement of the created components can be controlled by special distribution policies. Please see the corresponding documentation outlining the use of `hpx::new_`.
- Introduced four new distribution policies which can be used with many API functions which traditionally expected to be used with a locality id. The new distribution policies are:
  - `hpx::components::default_distribution_policy` which tries to place multiple component instances as evenly as possible.

<sup>3479</sup> <https://github.com/STELLAR-GROUP/hpx/issues/559>

<sup>3480</sup> <https://github.com/STELLAR-GROUP/hpx/issues/449>

<sup>3481</sup> <https://github.com/STELLAR-GROUP/hpx/issues/279>

<sup>3482</sup> <https://github.com/STELLAR-GROUP/hpx/issues/224>

<sup>3483</sup> <https://github.com/STELLAR-GROUP/hpx/issues/55>

<sup>3484</sup> <https://circleci.com/gh/STELLAR-GROUP/hpx>

- `hpx::components::colocating_distribution_policy` which will refer to the locality where a given component instance is currently placed.
- `hpx::components::binpacking_distribution_policy` which will place multiple component instances as evenly as possible based on any performance counter.
- `hpx::components::target_distribution_policy` which allows one to represent a given locality in the context of a distribution policy.
- The new distribution policies can now be also used with `hpx::async`. This change also deprecates `hpx::async_colocated(id, ...)` which now is replaced by a distribution policy: `hpx::async(hpx::colocated(id), ...)`.
- The `hpx::vector` and `hpx::unordered_map` data structures can now be used with the new distribution policies as well.
- The parallel facility `hpx::parallel::task_region` has been renamed to `hpx::parallel::task_block` based on the changes in the corresponding standardization proposal [N4411<sup>3485</sup>](#).
- Added extensions to the parallel facility `hpx::parallel::task_block` allowing to combine a `task_block` with an execution policy. This implies a minor breaking change as the `hpx::parallel::task_block` is now a template.
- Added new LCOs: `hpx::lcos::latch` and `hpx::lcos::local::latch` which semantically conform to the proposed `std::latch` (see [N4399<sup>3486</sup>](#)).
- Added performance counters exposing data related to data transferred by input/output (filesystem) operations (thanks to Maciej Brodowicz).
- Added performance counters allowing to track the number of action invocations (local and remote invocations).
- Added new command line options `-hpx:print-counter-at` and `-hpx:reset-counters`.
- The `hpx::vector` component has been renamed to `hpx::partitioned_vector` to make it explicit that the underlying memory is not contiguous.
- Introduced a completely new and uniform higher-level parallelism API which is based on executors. All existing parallelism APIs have been adapted to this. We have added a large number of different executor types, such as a numa-aware executor, a this-thread executor, etc.
- Added support for the MingW toolchain on Windows (thanks to Eric Lemanissier).
- HPX now includes support for APEX, (Autonomic Performance Environment for eXascale). APEX is an instrumentation and software adaptation library that provides an interface to TAU profiling / tracing as well as runtime adaptation of HPX applications through policy definitions. For more information and documentation, please see <https://github.com/UO-OACISS/xpress-apex>. To enable APEX at configuration time, specify `-DHPX_WITH_APEX=On`. To also include support for TAU profiling, specify `-DHPX_WITH_TAU=On` and specify the `-DTAU_ROOT`, `-DTAU_ARCH` and `-DTAU_OPTIONS` cmake parameters.
- We have implemented many more of the *Using parallel algorithms*. Please see [Issue #1141<sup>3487</sup>](#) for the list of all available parallel algorithms (thanks to Daniel Bourgeois and John Biddiscombe for contributing their work).

## Breaking changes

- We are moving into the direction of unifying managed and simple components. In order to stop exposing the old facilities, all examples have been converted to use the new classes. The breaking change in this release is that performance counters are now a `hpx::components::component_base` instead of `hpx::components::managed_component_base`.
- We removed the support for stackless threads. It turned out that there was no performance benefit when using stackless threads. As such, we decided to clean up our codebase. This feature was not documented.
- The CMake project name has changed from ‘hpx’ to ‘HPX’ for consistency and compatibility with naming conventions and other CMake projects. Generated config files go into `<prefix>/lib/cmake/HPX` and not `<prefix>/lib/cmake/hpx`.
- The macro `HPX_REGISTER_MINIMAL_COMPONENT_FACTORY` has been deprecated. Please use `HPX_REGISTER_COMPONENT` instead. The old macro will be removed in the next release.
- The obsolete `distributing_factory` and `binpacking_factory` components have been removed. The corresponding functionality is now provided by the `hpx::new_` API function in conjunction with the `hpx::default_layout` and `hpx::binpacking` distribution policies (`hpx::components::default_distribution_policy` and `hpx::components::binpacking_distribution_policy`)
- The API function `hpx::new_colocated` has been deprecated. Please use the consolidated API `hpx::new_` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of *HPX* if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The API function `hpx::async_colocated` has been deprecated. Please use the consolidated API `hpx::async` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of *HPX* if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The obsolete `remote_object` component has been removed.
- Replaced the use of Boost.Serialization with our own solution. While the new version is mostly compatible with Boost.Serialization, this change requires some minor code modifications in user code. For more information, please see the corresponding announcement<sup>3488</sup> on the [hpx-users@stellar.cct.lsu.edu](mailto:hpx-users@stellar.cct.lsu.edu) mailing list.
- The names used by cmake to influence various configuration options have been unified. The new naming scheme relies on all configuration constants to start with `HPX_WITH_...`, while the preprocessor constant which is used at build time starts with `HPX_HAVE_...`. For instance, the former cmake command line `-DHPX_MALLOC=...` now has to be specified a `-DHPX_WITH_MALLOC=...` and will cause the preprocessor constant `HPX_HAVE_MALLOC` to be defined. The actual name of the constant (i.e. `MALLOC`) has not changed. Please see the corresponding documentation for more details (*CMake variables used to configure HPX*).
- The `get_gid()` functions exposed by the component base classes `hpx::components::server::simple_component_base`, `hpx::components::server::managed_component_base` and `hpx::components::server::fixed_component_base` have been replaced by two new functions: `get_unmanaged_id()` and `get_id()`. To enable the old function name for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.
- All functions which were named `get_gid()` but were returning `hpx::id_type` have been renamed to `get_id()`. To enable the old function names for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #1855<sup>3489</sup> - Completely removing external/endian
- PR #1854<sup>3490</sup> - Don't pollute CMAKE\_CXX\_FLAGS through find\_package()
- PR #1853<sup>3491</sup> - Updating CMake configuration to get correct version of TAU library
- PR #1852<sup>3492</sup> - Fixing Performance Problems with MPI Parcelport
- PR #1851<sup>3493</sup> - Fixing hpx\_add\_link\_flag() and hpx\_remove\_link\_flag()
- PR #1850<sup>3494</sup> - Fixing 1836, adding parallel::sort
- PR #1849<sup>3495</sup> - Fixing configuration for use of more than 64 cores
- PR #1848<sup>3496</sup> - Change default APEX version for release
- PR #1847<sup>3497</sup> - Fix client\_base::then on release
- PR #1846<sup>3498</sup> - Removing broken lcos::local::channel from release
- PR #1845<sup>3499</sup> - Adding example demonstrating a possible safe-object implementation to release
- PR #1844<sup>3500</sup> - Removing stubs from accumulator examples
- PR #1843<sup>3501</sup> - Don't pollute CMAKE\_CXX\_FLAGS through find\_package()
- PR #1841<sup>3502</sup> - Fixing client\_base<>::then
- PR #1840<sup>3503</sup> - Adding example demonstrating a possible safe-object implementation
- PR #1838<sup>3504</sup> - Update version rc1
- PR #1837<sup>3505</sup> - Removing broken lcos::local::channel
- PR #1835<sup>3506</sup> - Adding explicit move constructor and assignment operator to hpx::lcos::promise
- PR #1834<sup>3507</sup> - Making hpx::lcos::promise move-only
- PR #1833<sup>3508</sup> - Adding fedora docs
- Issue #1832<sup>3509</sup> - hpx::lcos::promise<> must be move-only

<sup>3762</sup> <https://github.com/STELLAR-GROUP/hpx/pull/1556>

- PR #1555<sup>3763</sup> - Remove the necessity to specify archive flags on the receiving end
- PR #1554<sup>3764</sup> - Removing obsolete Boost.Serialization macros
- PR #1553<sup>3765</sup> - Properly fix HPX\_DEFINE\_\*\_ACTION macros
- PR #1552<sup>3766</sup> - Fixed algorithms relying on copy\_if implementation
- PR #1551<sup>3767</sup> - Pxfs - Modifying FindOrangeFS.cmake based on OrangeFS 2.9.X
- Issue #1550<sup>3768</sup> - Passing plain identifier inside HPX\_DEFINE\_PLAIN\_ACTION\_1
- PR #1549<sup>3769</sup> - Fixing intel14/libstdc++4.4
- PR #1548<sup>3770</sup> - Moving raw\_ptr to detail namespace
- PR #1547<sup>3771</sup> - Adding support for executors to future.then
- PR #1546<sup>3772</sup> - Executor traits result types
- PR #1545<sup>3773</sup> - Integrate executors with dataflow
- PR #1543<sup>3774</sup> - Fix potential zero-copy for primarynamespace::bulk\_service\_async et.al.
- PR #1542<sup>3775</sup> - Merging HPX0.9.10 into pxfs branch
- PR #1541<sup>3776</sup> - Removed stale cmake tests, unused since the great cmake refactoring
- PR #1540<sup>3777</sup> - Fix idle-rate on platforms without TSC
- PR #1539<sup>3778</sup> - Reporting situation if zero-copy-serialization was performed by a parcel generated from a plain apply/async
- PR #1538<sup>3779</sup> - Changed return type of bulk executors and added test
- Issue #1537<sup>3780</sup> - Incorrect cpuid config tests
- PR #1536<sup>3781</sup> - Changed return type of bulk executors and added test
- PR #1535<sup>3782</sup> - Make sure promise::get\_gid() can be called more than once
- PR #1534<sup>3783</sup> - Fixed async\_callback with bound callback
- PR #1533<sup>3784</sup> - Updated the link in the documentation to a publically- accessible URL
- PR #1532<sup>3785</sup> - Make sure sync primitives are not copyable nor movable

2.10. Releases

1771

- PR #1420<sup>3878</sup> - added .travis.yml
- Issue #1419<sup>3879</sup> - Unify enums: `hpx::runtime::state` and `hpx::state`
- PR #1416<sup>3880</sup> - Adding travis builder
- Issue #1414<sup>3881</sup> - Correct directory for dispatch\_gcc46.hpp iteration
- Issue #1410<sup>3882</sup> - Set operation algorithms
- Issue #1389<sup>3883</sup> - Parallel algorithms relying on scan partitioner break for small number of elements
- Issue #1325<sup>3884</sup> - Exceptions thrown during parcel handling are not handled correctly
- Issue #1315<sup>3885</sup> - Errors while running performance tests
- Issue #1309<sup>3886</sup> - `hpx::vector` partitions are not easily extendable by applications
- PR #1300<sup>3887</sup> - Added serialization/de-serialization to examples.tuplespace
- Issue #1251<sup>3888</sup> - `hpx::threads::get_thread_count` doesn't consider pending threads
- Issue #1008<sup>3889</sup> - Decrease in application performance overtime; occasional spikes of major slowdown
- Issue #1001<sup>3890</sup> - Zero copy serialization raises assert
- Issue #721<sup>3891</sup> - Make HPX usable for Xeon Phi
- Issue #524<sup>3892</sup> - Extend scheduler to support threads which can't be stolen

## 2.10.15 HPX V0.9.10 (Mar 24, 2015)

### General changes

This is the 12th official release of *HPX*. It coincides with the 7th anniversary of the first commit to our source code repository. Since then, we have seen over 12300 commits amounting to more than 220000 lines of C++ code.

The major focus of this release was to improve the reliability of large scale runs. We believe to have achieved this goal as we now can reliably run *HPX* applications on up to ~24k cores. We have also shown that *HPX* can be used with success for symmetric runs (applications using both, host cores and Intel Xeon/Phi coprocessors). This is a huge step forward in terms of the usability of *HPX*. The main focus of this work involved isolating the causes of the segmentation faults at start up and shut down. Many of these issues were discovered to be the result of the suspension of threads which hold locks.

A very important improvement introduced with this release is the refactoring of the code representing our parcel-port implementation. Parcel- ports can now be implemented by 3rd parties as independent plugins which are dynamically loaded at runtime (static linking of parcel-ports is also supported). This refactoring also includes a massive improvement of the performance of our existing parcel-ports. We were able to significantly reduce the networking latencies

and to improve the available networking bandwidth. Please note that in this release we disabled the ibverbs and ipc parcel ports as those have not been ported to the new plugin system yet (see [Issue #839<sup>3893</sup>](#)).

Another corner stone of this release is our work towards a complete implementation of `__cpp11_n4104` (Working Draft, Technical Specification for C++ Extensions for Parallelism). This document defines a set of parallel algorithms to be added to the C++ standard library. We now have implemented about 75% of all specified parallel algorithms (see [link hpx.manual.parallel.parallel\_algorithms Parallel Algorithms] for more details). We also implemented some extensions to `__cpp11_n4104` allowing to invoke all of the algorithms asynchronously.

This release adds a first implementation of `hpx::vector` which is a distributed data structure closely aligned to the functionality of `std::vector`. The difference is that `hpx::vector` stores the data in partitions where the partitions can be distributed over different localities. We started to work on allowing to use the parallel algorithms with `hpx::vector`. At this point we have implemented only a few of the parallel algorithms to support distributed data structures (like `hpx::vector`) for testing purposes (see [Issue #1338<sup>3894</sup>](#) for a documentation of our progress).

## Breaking changes

With this release we put a lot of effort into changing the code base to be more compatible to C++11. These changes have caused the following issues for backward compatibility:

- Move to Variadics- All of the API now uses variadic templates. However, this change required to modify the argument sequence for some of the exiting API functions (`hpx::async_continue`, `hpx::apply_continue`, `hpx::when_each`, `hpx::wait_each`, synchronous invocation of actions).
- Changes to Macros- We also removed the macros `HPX_STD_FUNCTION` and `HPX_STD_TUPLE`. This shouldn't affect any user code as we replaced `HPX_STD_FUNCTION` with `hpx::util::function_nonser` which was the default expansion used for this macro. All `HPX` API functions which expect a `hpx::util::function_nonser` (or a `hpx::util::unique_function_nonser`) can now be transparently called with a compatible `std::function` instead. Similarly, `HPX_STD_TUPLE` was replaced by its default expansion as well: `hpx::util::tuple`.
- Changes to `hpx::unique_future`- `hpx::unique_future`, which was deprecated in the previous release for `hpx::future` is now completely removed from `HPX`. This completes the transition to a completely standards conforming implementation of `hpx::future`.
- Changes to Supported Compilers. Finally, in order to utilize more C++11 semantics, we have officially dropped support for GCC 4.4 and MSVC 2012. Please see our *Prerequisites* page for more details.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [Issue #1402<sup>3895</sup>](#) - Internal shared\_future serialization copies
- [Issue #1399<sup>3896</sup>](#) - Build takes unusually long time...
- [Issue #1398<sup>3897</sup>](#) - Tests using the scan partitioner are broken on at least gcc 4.7 and intel compiler
- [Issue #1397<sup>3898</sup>](#) - Completely remove `hpx::unique_future`
- [Issue #1396<sup>3899</sup>](#) - Parallel scan algorithms with different initial values

- Issue #680<sup>4004</sup> - Convert parcel ports into a plugin system
- Issue #582<sup>4005</sup> - Make exception thrown from HPX threads available from hpx::init
- Issue #504<sup>4006</sup> - Refactor Dataflow LCO to work with futures
- Issue #196<sup>4007</sup> - Don’t store copies of the locality network metadata in the gva table

## 2.10.16 HPX V0.9.9 (Oct 31, 2014, codename Spooky)

### General changes

We have had over 1500 commits since the last release and we have closed over 200 tickets (bugs, feature requests, pull requests, etc.). These are by far the largest numbers of commits and resolved issues for any of the *HPX* releases so far. We are especially happy about the large number of people who contributed for the first time to *HPX*.

- We completed the transition from the older (non-conforming) implementation of hpx::future to the new and fully conforming version by removing the old code and by renaming the type hpx::unique\_future to hpx::future. In order to maintain backwards compatibility with existing code which uses the type hpx::unique\_future we support the configuration variable HPX\_UNIQUE\_FUTURE\_ALIAS. If this variable is set to ON while running cmake it will additionally define a template alias for this type.

<sup>3996</sup> <https://github.com/STELLAR-GROUP/hpx/issues/1220>

3997 <https://github.com/STELLAR-GROUP/hpx/issues/1217>3998 <https://github.com/STELLAR-GROUP/hpx/issues/1168>3999 <https://github.com/STELLAR-GROUP/hpx/issues/1085>4000 <https://github.com/STELLAR-GROUP/hpx/issues/981>4001 <https://github.com/STELLAR-GROUP/hpx/issues/857>4002 <https://github.com/STELLAR-GROUP/hpx/issues/850>4003 <https://github.com/STELLAR-GROUP/hpx/issues/763>4004 <https://github.com/STELLAR-GROUP/hpx/issues/680>4005 <https://github.com/STELLAR-GROUP/hpx/issues/582>4006 <https://github.com/STELLAR-GROUP/hpx/issues/504>4007 <https://github.com/STELLAR-GROUP/hpx/issues/196>

- We rewrote and significantly changed our build system. Please have a look at the new (now generated) documentation here: *HPX build system*. Please revisit your build scripts to adapt to the changes. The most notable changes are:
  - HPX\_NO\_INSTALL is no longer necessary.
  - For external builds, you need to set HPX\_DIR instead of HPX\_ROOT as described here: *Using HPX with CMake-based projects*.
  - IDEs that support multiple configurations (Visual Studio and XCode) can now be used as intended. that means no build dir.
  - Building HPX statically (without dynamic libraries) is now supported (-DHPX\_STATIC\_LINKING=On).
  - Please note that many variables used to configure the build process have been renamed to unify the naming conventions (see the section *CMake variables used to configure HPX* for more information).
  - This also fixes a long list of issues, for more information see [Issue #1204<sup>4008</sup>](#).
- We started to implement various proposals to the C++ Standardization committee related to parallelism and concurrency, most notably [N4409<sup>4009</sup>](#) (Working Draft, Technical Specification for C++ Extensions for Parallelism), [N4411<sup>4010</sup>](#) (Task Region Rev. 3), and [N4313<sup>4011</sup>](#) (Working Draft, Technical Specification for C++ Extensions for Concurrency).
- We completely remodeled our automatic build system to run builds and unit tests on various systems and compilers. This allows us to find most bugs right as they were introduced and helps to maintain a high level of quality and compatibility. The newest build logs can be found at [HPX Buildbot Website<sup>4012</sup>](#).

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue [#1296<sup>4013</sup>](#) - Rename make\_error\_future to make\_exceptional\_future, adjust to N4123
- Issue [#1295<sup>4014</sup>](#) - building issue
- Issue [#1293<sup>4015</sup>](#) - Transpose example
- Issue [#1292<sup>4016</sup>](#) - Wrong abs() function used in example
- Issue [#1291<sup>4017</sup>](#) - non-synchronized shift operators have been removed
- Issue [#1290<sup>4018</sup>](#) - RDTSCP is defined as true for Xeon Phi build
- Issue [#1289<sup>4019</sup>](#) - Fixing 1288
- Issue [#1288<sup>4020</sup>](#) - Add new performance counters
- Issue [#1287<sup>4021</sup>](#) - Hierarchy scheduler broken performance counters

- Issue #1286<sup>4022</sup> - Algorithm cleanup
- Issue #1285<sup>4023</sup> - Broken Links in Documentation
- Issue #1284<sup>4024</sup> - Uninitialized copy
- Issue #1283<sup>4025</sup> - missing boost::scoped\_ptr includes
- Issue #1282<sup>4026</sup> - Update documentation of build options for schedulers
- Issue #1281<sup>4027</sup> - reset idle rate counter
- Issue #1280<sup>4028</sup> - Bug when executing on Intel MIC
- Issue #1279<sup>4029</sup> - Add improved when\_all/wait\_all
- Issue #1278<sup>4030</sup> - Implement improved when\_all/wait\_all
- Issue #1277<sup>4031</sup> - feature request: get access to argc argv and variables\_map
- Issue #1276<sup>4032</sup> - Remove merging map
- Issue #1274<sup>4033</sup> - Weird (wrong) string code in papi.cpp
- Issue #1273<sup>4034</sup> - Sequential task execution policy
- Issue #1272<sup>4035</sup> - Avoid CMake name clash for Boost.Thread library
- Issue #1271<sup>4036</sup> - Updates on HPX Test Units
- Issue #1270<sup>4037</sup> - hpx/util/safe\_lexical\_cast.hpp is added
- Issue #1269<sup>4038</sup> - Added default value for “LIB” cmake variable
- Issue #1268<sup>4039</sup> - Memory Counters not working
- Issue #1266<sup>4040</sup> - FindHPX.cmake is not installed
- Issue #1263<sup>4041</sup> - apply\_remote test takes too long
- Issue #1262<sup>4042</sup> - Chrono cleanup
- Issue #1261<sup>4043</sup> - Need make install for papi counters and this builds all the examples
- Issue #1260<sup>4044</sup> - Documentation of Stencil example claims

<sup>4044</sup> <https://github.com/STELLAR-GROUP/hpx/issues/1260>

- Issue #1259<sup>4045</sup> - Avoid double-linking Boost on Windows
- Issue #1257<sup>4046</sup> - Adding additional parameter to create\_thread
- Issue #1256<sup>4047</sup> - added buildbot changes to release notes
- Issue #1255<sup>4048</sup> - Cannot build MiniGhost
- Issue #1253<sup>4049</sup> - hpx::thread defects
- Issue #1252<sup>4050</sup> - HPX\_PREFIX is too fragile
- Issue #1250<sup>4051</sup> - switch\_to\_fiber\_emulation does not work properly
- Issue #1249<sup>4052</sup> - Documentation is generated under Release folder
- Issue #1248<sup>4053</sup> - Fix usage of hpx\_generic\_coroutine\_context and get tests passing on powerpc
- Issue #1247<sup>4054</sup> - Dynamic linking error
- Issue #1246<sup>4055</sup> - Make cpuid.cpp C++11 compliant
- Issue #1245<sup>4056</sup> - HPX fails on startup (setting thread affinity mask)
- Issue #1244<sup>4057</sup> - HPX\_WITH\_RDTSC configure test fails, but should succeed
- Issue #1243<sup>4058</sup> - CTest dashboard info for CSCS CDash drop location
- Issue #1242<sup>4059</sup> - Mac fixes
- Issue #1241<sup>4060</sup> - Failure in Distributed with Boost 1.56
- Issue #1240<sup>4061</sup> - fix a race condition in examples.diskperf
- Issue #1239<sup>4062</sup> - fix wait\_each in examples.diskperf
- Issue #1238<sup>4063</sup> - Fixed #1237: hpx::util::portable\_binary\_iarchive failed
- Issue #1237<sup>4064</sup> - hpx::util::portable\_binary\_iarchive faileds
- Issue #1235<sup>4065</sup> - Fixing clang warnings and errors
- Issue #1234<sup>4066</sup> - TCP runs fail: Transport endpoint is not connected
- Issue #1233<sup>4067</sup> - Making sure the correct number of threads is registered with AGAS

<sup>4067</sup> <https://github.com/STELLAR-GROUP/hpx/issues/1233>

- Issue #1232<sup>4068</sup> - Fixing race in wait\_xxx
- Issue #1231<sup>4069</sup> - Parallel minmax
- Issue #1230<sup>4070</sup> - Distributed run of 1d\_stencil\_8 uses less threads than spec. & sometimes gives errors
- Issue #1229<sup>4071</sup> - Unstable number of threads
- Issue #1228<sup>4072</sup> - HPX link error (cmake / MPI)
- Issue #1226<sup>4073</sup> - Warning about struct/class thread\_counters
- Issue #1225<sup>4074</sup> - Adding parallel::replace etc
- Issue #1224<sup>4075</sup> - Extending dataflow to pass through non-future arguments
- Issue #1223<sup>4076</sup> - Remaining find algorithms implemented, N4071
- Issue #1222<sup>4077</sup> - Merging all the changes
- Issue #1221<sup>4078</sup> - No error output when using mpirun with hpx
- Issue #1219<sup>4079</sup> - Adding new AGAS cache performance counters
- Issue #1216<sup>4080</sup> - Fixing using futures (clients) as arguments to actions
- Issue #1215<sup>4081</sup> - Error compiling simple component
- Issue #1214<sup>4082</sup> - Stencil docs
- Issue #1213<sup>4083</sup> - Using more than a few dozen MPI processes on SuperMike results in a seg fault before getting to hpx\_main
- Issue #1212<sup>4084</sup> - Parallel rotate
- Issue #1211<sup>4085</sup> - Direct actions cause the future's shared\_state to be leaked
- Issue #1210<sup>4086</sup> - Refactored local::promise to be standard conformant
- Issue #1209<sup>4087</sup> - Improve command line handling
- Issue #1208<sup>4088</sup> - Adding parallel::reverse and parallel::reverse\_copy
- Issue #1207<sup>4089</sup> - Add copy\_backward and move\_backward
- Issue #1206<sup>4090</sup> - N4071 additional algorithms implemented

<sup>4090</sup> <https://github.com/STELLAR-GROUP/hpx/issues/1206>

- Issue #1204<sup>4091</sup> - Cmake simplification and various other minor changes
- Issue #1203<sup>4092</sup> - Implementing new launch policy for (local) async: `hpx::launch::fork`.
- Issue #1202<sup>4093</sup> - Failed assertion in `connection_cache.hpp`
- Issue #1201<sup>4094</sup> - `pkg-config` doesn't add mpi link directories
- Issue #1200<sup>4095</sup> - Error when querying time performance counters
- Issue #1199<sup>4096</sup> - library path is now configurable (again)
- Issue #1198<sup>4097</sup> - Error when querying performance counters
- Issue #1197<sup>4098</sup> - tests fail with intel compiler
- Issue #1196<sup>4099</sup> - Silence several warnings
- Issue #1195<sup>4100</sup> - Rephrase initializers to work with VC++ 2012
- Issue #1194<sup>4101</sup> - Simplify parallel algorithms
- Issue #1193<sup>4102</sup> - Adding `parallel::equal`
- Issue #1192<sup>4103</sup> - HPX(`out_of_memory`) on including `<hpx/hpx.hpp>`
- Issue #1191<sup>4104</sup> - Fixing #1189
- Issue #1190<sup>4105</sup> - Chrono cleanup
- Issue #1189<sup>4106</sup> - Deadlock .. somewhere? (probably serialization)
- Issue #1188<sup>4107</sup> - Removed `future::get_status()`
- Issue #1186<sup>4108</sup> - Fixed FindOpenCL to find current AMD APP SDK
- Issue #1184<sup>4109</sup> - Tweaking future unwrapping
- Issue #1183<sup>4110</sup> - Extended `parallel::reduce`
- Issue #1182<sup>4111</sup> - `future::unwrap` hangs for `launch::deferred`
- Issue #1181<sup>4112</sup> - Adding `all_of`, `any_of`, and `none_of` and corresponding documentation
- Issue #1180<sup>4113</sup> - `hpx::cout` defect

<sup>4113</sup> <https://github.com/STELLAR-GROUP/hpx/issues/1180>

- Issue #1179<sup>4114</sup> - hpx::async does not work for member function pointers when called on types with self-defined unary operator\*
- Issue #1178<sup>4115</sup> - Implemented variadic hpx::util::zip\_iterator
- Issue #1177<sup>4116</sup> - MPI parcelport defect
- Issue #1176<sup>4117</sup> - HPX\_DEFINE\_COMPONENT\_CONST\_ACTION\_TPL does not have a 2-argument version
- Issue #1175<sup>4118</sup> - Create util::zip\_iterator working with util::tuple<>
- Issue #1174<sup>4119</sup> - Error Building HPX on linux, root\_certificate\_authority.cpp
- Issue #1173<sup>4120</sup> - hpx::cout output lost
- Issue #1172<sup>4121</sup> - HPX build error with Clang 3.4.2
- Issue #1171<sup>4122</sup> - CMAKE\_INSTALL\_PREFIX ignored
- Issue #1170<sup>4123</sup> - Close hpx\_benchmarks repository on Github
- Issue #1169<sup>4124</sup> - Buildbot emails have syntax error in url
- Issue #1167<sup>4125</sup> - Merge partial implementation of standards proposal N3960
- Issue #1166<sup>4126</sup> - Fixed several compiler warnings
- Issue #1165<sup>4127</sup> - cmake warns: “tests.regressions.actions” does not exist
- Issue #1164<sup>4128</sup> - Want my own serialization of hpx::future
- Issue #1162<sup>4129</sup> - Segfault in hello\_world example
- Issue #1161<sup>4130</sup> - Use HPX\_ASSERT to aid the compiler
- Issue #1160<sup>4131</sup> - Do not put -DNDEBUG into hpx\_application.pc
- Issue #1159<sup>4132</sup> - Support Clang 3.4.2
- Issue #1158<sup>4133</sup> - Fixed #1157: Rename when\_n/wait\_n, add when\_xxx\_n/wait\_xxx\_n
- Issue #1157<sup>4134</sup> - Rename when\_n/wait\_n, add when\_xxx\_n/wait\_xxx\_n
- Issue #1156<sup>4135</sup> - Force inlining fails
- Issue #1155<sup>4136</sup> - changed header of printout to be compatible with python csv module

- Issue #1154<sup>4137</sup> - Fixing iostreams
- Issue #1153<sup>4138</sup> - Standard manipulators (like std::endl) do not work with hpx::ostream
- Issue #1152<sup>4139</sup> - Functions revamp
- Issue #1151<sup>4140</sup> - Suppressing cmake 3.0 policy warning for CMP0026
- Issue #1150<sup>4141</sup> - Client Serialization error
- Issue #1149<sup>4142</sup> - Segfault on Stampede
- Issue #1148<sup>4143</sup> - Refactoring mini-ghost
- Issue #1147<sup>4144</sup> - N3960 copy\_if and copy\_n implemented and tested
- Issue #1146<sup>4145</sup> - Stencil print
- Issue #1145<sup>4146</sup> - N3960 hpx::parallel::copy implemented and tested
- Issue #1144<sup>4147</sup> - OpenMP examples 1d\_stencil do not build
- Issue #1143<sup>4148</sup> - 1d\_stencil OpenMP examples do not build
- Issue #1142<sup>4149</sup> - Cannot build HPX with gcc 4.6 on OS X
- Issue #1140<sup>4150</sup> - Fix OpenMP lookup, enable usage of config tests in external CMake projects.
- Issue #1139<sup>4151</sup> - hpx/hpx/config/compiler\_specific.hpp
- Issue #1138<sup>4152</sup> - clean up pkg-config files
- Issue #1137<sup>4153</sup> - Improvements to create binary packages
- Issue #1136<sup>4154</sup> - HPX\_GCC\_VERSION not defined on all compilers
- Issue #1135<sup>4155</sup> - Avoiding collision between winsock2.h and windows.h
- Issue #1134<sup>4156</sup> - Making sure, that hpx::finalize can be called from any locality
- Issue #1133<sup>4157</sup> - 1d stencil examples
- Issue #1131<sup>4158</sup> - Refactor unique\_function implementation
- Issue #1130<sup>4159</sup> - Unique function

## 2.10.17 HPX V0.9.8 (Mar 24, 2014)

We have had over 800 commits since the last release and we have closed over 65 tickets (bugs, feature requests, etc.).

With the changes below, *HPX* is once again leading the charge of a whole new era of computation. By intrinsically breaking down and synchronizing the work to be done, *HPX* insures that application developers will no longer have to fret about where a segment of code executes. That allows coders to focus their time and energy to understanding the data dependencies of their algorithms and thereby the core obstacles to an efficient code. Here are some of the advantages of using *HPX*:

- *HPX* is solidly rooted in a sophisticated theoretical execution model – ParalleX
- *HPX* exposes an API fully conforming to the C++11 and the draft C++14 standards, extended and applied to distributed computing. Everything programmers know about the concurrency primitives of the standard C++ library is still valid in the context of *HPX*.
- It provides a competitive, high performance implementation of modern, future-proof ideas which gives an smooth migration path from today's mainstream techniques
- There is no need for the programmer to worry about lower level parallelization paradigms like threads or message passing; no need to understand pthreads, MPI, OpenMP, or Windows threads, etc.
- There is no need to think about different types of parallelism such as tasks, pipelines, or fork-join, task or data parallelism.
- The same source of your program compiles and runs on Linux, BlueGene/Q, Mac OS X, Windows, and Android.
- The same code runs on shared memory multi-core systems and supercomputers, on handheld devices and Intel® Xeon Phi™ accelerators, or a heterogeneous mix of those.

## General changes

- A major API breaking change for this release was introduced by implementing `hpx::future` and `hpx::shared_future` fully in conformance with the C++11 Standard<sup>4237</sup>. While `hpx::shared_future` is new and will not create any compatibility problems, we revised the interface and implementation of the existing `hpx::future`. For more details please see the mailing list archive<sup>4238</sup>. To avoid any incompatibilities for existing code we named the type which implements the `std::future` interface as `hpx::unique_future`. For the next release this will be renamed to `hpx::future`, making it full conforming to C++11 Standard<sup>4239</sup>.
- A large part of the code base of HPX has been refactored and partially re-implemented. The main changes were related to
  - The threading subsystem: these changes significantly reduce the amount of overheads caused by the schedulers, improve the modularity of the code base, and extend the variety of available scheduling algorithms.
  - The parcel subsystem: these changes improve the performance of the HPX networking layer, modularize the structure of the parcelports, and simplify the creation of new parcelports for other underlying networking libraries.
  - The API subsystem: these changes improved the conformance of the API to C++11 Standard, extend and unify the available API functionality, and decrease the overheads created by various elements of the API.
  - The robustness of the component loading subsystem has been improved significantly, allowing to more portably and more reliably register the components needed by an application at startup. This additionally speeds up general application initialization.
- We added new API functionality like `hpx::migrate` and `hpx::copy_component` which are the basic building blocks necessary for implementing higher level abstractions for system-wide load balancing, runtime-adaptive resource management, and object-oriented checkpointing and state-management.
- We removed the use of C++11 move emulation (using Boost.Move), replacing it with C++11 rvalue references. This is the first step towards using more and more native C++11 facilities which we plan to introduce in the future.
- We improved the reference counting scheme used by HPX which helps managing distributed objects and memory. This improves the overall stability of HPX and further simplifies writing real world applications.
- The minimal Boost version required to use HPX is now V1.49.0.
- This release coincides with the first release of HPXPI (V0.1.0), the first implementation of the XPI specification<sup>4240</sup>.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1086<sup>4241</sup> - Expose internal boost::shared\_array to allow user management of array lifetime
- Issue #1083<sup>4242</sup> - Make shell examples copyable in docs
- Issue #1080<sup>4243</sup> - /threads{locality#\*/total}/count/cumulative broken

<sup>4242</sup> <https://github.com/STELLAR-GROUP/hpx/issues/1083>

<sup>4243</sup> <https://github.com/STELLAR-GROUP/hpx/issues/1080>

- Issue #1079<sup>4244</sup> - Build problems on OS X
- Issue #1078<sup>4245</sup> - Improve robustness of component loading
- Issue #1077<sup>4246</sup> - Fix a missing enum definition for ‘take’ mode
- Issue #1076<sup>4247</sup> - Merge Jb master
- Issue #1075<sup>4248</sup> - Unknown CMake command “add\_hpx\_pseudo\_target”
- Issue #1074<sup>4249</sup> - Implement apply\_continue\_callback and apply\_colocated\_callback
- Issue #1073<sup>4250</sup> - The new apply\_colocated and async\_colocated functions lead to automatic registered functions
- Issue #1071<sup>4251</sup> - Remove deferred\_packaged\_task
- Issue #1069<sup>4252</sup> - serialize\_buffer with allocator fails at destruction
- Issue #1068<sup>4253</sup> - Coroutine include and forward declarations missing
- Issue #1067<sup>4254</sup> - Add allocator support to util::serialize\_buffer
- Issue #1066<sup>4255</sup> - Allow for MPI\_Init being called before HPX launches
- Issue #1065<sup>4256</sup> - AGAS cache isn’t used/populated on worker localities
- Issue #1064<sup>4257</sup> - Reorder includes to ensure ws2 includes early
- Issue #1063<sup>4258</sup> - Add hpx::runtime::suspend and hpx::runtime::resume
- Issue #1062<sup>4259</sup> - Fix async\_continue to properly handle return types
- Issue #1061<sup>4260</sup> - Implement async\_colocated and apply\_colocated
- Issue #1060<sup>4261</sup> - Implement minimal component migration
- Issue #1058<sup>4262</sup> - Remove HPX\_UTIL\_TUPLE from code base
- Issue #1057<sup>4263</sup> - Add performance counters for threading subsystem
- Issue #1055<sup>4264</sup> - Thread allocation uses two memory pools
- Issue #1053<sup>4265</sup> - Work stealing flawed
- Issue #1052<sup>4266</sup> - Fix a number of warnings

<sup>4266</sup> <https://github.com/STELLAR-GROUP/hpx/issues/1052>

- Issue #1049<sup>4267</sup> - Fixes for TLS on OSX and more reliable test running
- Issue #1048<sup>4268</sup> - Fixing after 588 hang
- Issue #1047<sup>4269</sup> - Use port ‘0’ for networking when using one locality
- Issue #1046<sup>4270</sup> - composable\_guard test is broken when having more than one thread
- Issue #1045<sup>4271</sup> - Security missing headers
- Issue #1044<sup>4272</sup> - Native TLS on FreeBSD via \_\_thread
- Issue #1043<sup>4273</sup> - async et.al. compute the wrong result type
- Issue #1042<sup>4274</sup> - async et.al. implicitly unwrap reference\_wrappers
- Issue #1041<sup>4275</sup> - Remove redundant costly Kleene stars from regex searches
- Issue #1040<sup>4276</sup> - CMake script regex match patterns has unnecessary kleenes
- Issue #1039<sup>4277</sup> - Remove use of Boost.Move and replace with std::move and real rvalue refs
- Issue #1038<sup>4278</sup> - Bump minimal required Boost to 1.49.0
- Issue #1037<sup>4279</sup> - Implicit unwrapping of futures in async broken
- Issue #1036<sup>4280</sup> - Scheduler hangs when user code attempts to “block” OS-threads
- Issue #1035<sup>4281</sup> - Idle-rate counter always reports 100% idle rate
- Issue #1034<sup>4282</sup> - Symbolic name registration causes application hangs
- Issue #1033<sup>4283</sup> - Application options read in from an options file generate an error message
- Issue #1032<sup>4284</sup> - hpx::id\_type local reference counting is wrong
- Issue #1031<sup>4285</sup> - Negative entry in reference count table
- Issue #1030<sup>4286</sup> - Implement condition\_variable
- Issue #1029<sup>4287</sup> - Deadlock in thread scheduling subsystem
- Issue #1028<sup>4288</sup> - HPX-thread cumulative count performance counters report incorrect value
- Issue #1027<sup>4289</sup> - Expose hpx::thread\_interrupted error code as a separate exception type

## 2.10.18 HPX V0.9.7 (Nov 13, 2013)

We have had over 1000 commits since the last release and we have closed over 180 tickets (bugs, feature requests, etc.).

### General changes

- Ported HPX to BlueGene/Q
- Improved HPX support for Xeon/Phi accelerators
- Reimplemented `hpx::bind`, `hpx::tuple`, and `hpx::function` for better performance and better compliance with the C++11 Standard. Added `hpx::mem_fn`.
- Reworked `hpx::when_all` and `hpx::when_any` for better compliance with the ongoing C++ standardization effort, added heterogeneous version for those functions. Added `hpx::when_any_swapped`.
- Added `hpx::copy` as a precursor for a migrate functionality
- Added `hpx::get_ptr` allowing to directly access the memory underlying a given component
- Added the `hpx::lcos::broadcast`, `hpx::lcos::reduce`, and `hpx::lcos::fold` collective operations
- Added `hpx::get_locality_name` allowing to retrieve the name of any of the localities for the application.
- Added support for more flexible thread affinity control from the HPX command line, such as new modes for `--hpx:bind` (balanced, scattered, compact), improved default settings when running multiple localities on the same node.
- Added experimental executors for simpler thread pooling and scheduling. This API may change in the future as it will stay aligned with the ongoing C++ standardization efforts.
- Massively improved the performance of the HPX serialization code. Added partial support for zero copy serialization of array and bitwise-copyable types.
- General performance improvements of the code related to threads and futures.

### Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1005<sup>4315</sup> - Allow one to disable array optimizations and zero copy optimizations for each parcelport
- Issue #1004<sup>4316</sup> - Generate new HPX logo image for the docs
- Issue #1002<sup>4317</sup> - If MPI parcelport is not available, running HPX under mpirun should fail
- Issue #1001<sup>4318</sup> - Zero copy serialization raises assert

- Issue #884<sup>4415</sup> - is\_callable failing with member pointers in C++11
- Issue #883<sup>4416</sup> - Need help with is\_callable\_test
- Issue #882<sup>4417</sup> - tests.regressions.lcos.future\_hang\_on\_get does not terminate
- Issue #881<sup>4418</sup> - tests/regressions/block\_matrix/matrix.hh won't compile with GCC 4.8.1
- Issue #880<sup>4419</sup> - HPX does not work on OS X
- Issue #878<sup>4420</sup> - future::unwrap triggers assertion
- Issue #877<sup>4421</sup> - “make tests” has build errors on Ubuntu 12.10
- Issue #876<sup>4422</sup> - tcmalloc is used by default, even if it is not present
- Issue #875<sup>4423</sup> - global\_fixture is defined in a header file
- Issue #874<sup>4424</sup> - Some tests take very long
- Issue #873<sup>4425</sup> - Add block-matrix code as regression test
- Issue #872<sup>4426</sup> - HPX documentation does not say how to run tests with detailed output
- Issue #871<sup>4427</sup> - All tests fail with “make test”
- Issue #870<sup>4428</sup> - Please explicitly disable serialization in classes that don't support it
- Issue #868<sup>4429</sup> - boost\_any test failing
- Issue #867<sup>4430</sup> - Reduce the number of copies of hpx::function arguments
- Issue #863<sup>4431</sup> - Futures should not require a default constructor
- Issue #862<sup>4432</sup> - value\_or\_error shall not default construct its result

## 2.10.19 HPX V0.9.6 (Jul 30, 2013)

We have had over 1200 commits since the last release and we have closed roughly 140 tickets (bugs, feature requests, etc.).

### General changes

The major new features in this release are:

- We further consolidated the API exposed by *HPX*. We aligned our APIs as much as possible with the existing C++11 Standard<sup>4501</sup> and related proposals to the C++ standardization committee (such as N3632<sup>4502</sup> and N3857<sup>4503</sup>).
- We implemented a first version of a distributed AGAS service which essentially eliminates all explicit AGAS network traffic.
- We created a native ibverbs parcelport allowing to take advantage of the superior latency and bandwidth characteristics of Infiniband networks.
- We successfully ported *HPX* to the Xeon Phi platform.
- Support for the SLURM scheduling system was implemented.
- Major efforts have been dedicated to improving the performance counter framework, numerous new counters were implemented and new APIs were added.
- We added a modular parcel compression system allowing to improve bandwidth utilization (by reducing the overall size of the transferred data).
- We added a modular parcel coalescing system allowing to combine several parcels into larger messages. This reduces latencies introduced by the communication layer.
- Added an experimental executors API allowing to use different scheduling policies for different parts of the code. This API has been modelled after the Standards proposal N3562<sup>4504</sup>. This API is bound to change in the future, though.
- Added minimal security support for localities which is enforced on the parcelport level. This support is preliminary and experimental and might change in the future.
- We created a parcelport using low level MPI functions. This is in support of legacy applications which are to be gradually ported and to support platforms where MPI is the only available portable networking layer.
- We added a preliminary and experimental implementation of a tuple-space object which exposes an interface similar to such systems described in the literature (see for instance The Linda Coordination Language<sup>4505</sup>).

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is again a very long list of newly implemented features and fixed issues.

- Issue #806<sup>4506</sup> - make (all) in examples folder does nothing
- Issue #805<sup>4507</sup> - Adding the introduction and fixing DOCBOOK dependencies for Windows use
- Issue #804<sup>4508</sup> - Add stackless (non-suspendable) thread type
- Issue #803<sup>4509</sup> - Create proper serialization support functions for util::tuple
- Issue #800<sup>4510</sup> - Add possibility to disable array optimizations during serialization
- Issue #798<sup>4511</sup> - HPX\_LIMIT does not work for local dataflow
- Issue #797<sup>4512</sup> - Create a parcelport which uses MPI
- Issue #796<sup>4513</sup> - Problem with Large Numbers of Threads
- Issue #793<sup>4514</sup> - Changing dataflow test case to hang consistently
- Issue #792<sup>4515</sup> - CMake Error
- Issue #791<sup>4516</sup> - Problems with local::dataflow
- Issue #790<sup>4517</sup> - wait\_for() doesn't compile
- Issue #789<sup>4518</sup> - HPX with Intel compiler segfaults
- Issue #788<sup>4519</sup> - Intel compiler support
- Issue #787<sup>4520</sup> - Fixed SFINAEd specializations
- Issue #786<sup>4521</sup> - Memory issues during benchmarking.
- Issue #785<sup>4522</sup> - Create an API allowing to register external threads with HPX
- Issue #784<sup>4523</sup> - util::plugin is throwing an error when a symbol is not found
- Issue #783<sup>4524</sup> - How does hpx:bind work?
- Issue #782<sup>4525</sup> - Added quotes around STRING REPLACE potentially empty arguments
- Issue #781<sup>4526</sup> - Make sure no exceptions propagate into the thread manager

4526 <https://github.com/STELLAR-GROUP/hpx/issues/781>

- Issue #780<sup>4527</sup> - Allow arithmetics performance counters to expand its parameters
- Issue #779<sup>4528</sup> - Test case for 778
- Issue #778<sup>4529</sup> - Swapping futures segfaults
- Issue #777<sup>4530</sup> - hpx::lcos::details::when\_xxx don't restore completion handlers
- Issue #776<sup>4531</sup> - Compiler chokes on dataflow overload with launch policy
- Issue #775<sup>4532</sup> - Runtime error with local dataflow (copying futures?)
- Issue #774<sup>4533</sup> - Using local dataflow without explicit namespace
- Issue #773<sup>4534</sup> - Local dataflow with unwrap: functor operators need to be const
- Issue #772<sup>4535</sup> - Allow (remote) actions to return a future
- Issue #771<sup>4536</sup> - Setting HPX\_LIMIT gives huge boost MPL errors
- Issue #770<sup>4537</sup> - Add launch policy to (local) dataflow
- Issue #769<sup>4538</sup> - Make compile time configuration information available
- Issue #768<sup>4539</sup> - Const correctness problem in local dataflow
- Issue #767<sup>4540</sup> - Add launch policies to async
- Issue #766<sup>4541</sup> - Mark data structures for optimized (array based) serialization
- Issue #765<sup>4542</sup> - Align hpx::any with N3508: Any Library Proposal (Revision 2)
- Issue #764<sup>4543</sup> - Align hpx::future with newest N3558: A Standardized Representation of Asynchronous Operations
- Issue #762<sup>4544</sup> - added a human readable output for the ping pong example
- Issue #761<sup>4545</sup> - Ambiguous typename when constructing derived component
- Issue #760<sup>4546</sup> - Simple components can not be derived
- Issue #759<sup>4547</sup> - make install doesn't give a complete install
- Issue #758<sup>4548</sup> - Stack overflow when using locking\_hook<>
- Issue #757<sup>4549</sup> - copy paste error; unsupported function overloading

- Issue #755<sup>4551</sup> - Papi counters don't work with reset and evaluate API's
- Issue #753<sup>4552</sup> - cmake bugfix and improved component action docs
- Issue #752<sup>4553</sup> - hpx simple component docs
- Issue #750<sup>4554</sup> - Add hpx::util::any
- Issue #749<sup>4555</sup> - Thread phase counter is not reset
- Issue #748<sup>4556</sup> - Memory performance counter are not registered
- Issue #747<sup>4557</sup> - Create performance counters exposing arithmetic operations
- Issue #745<sup>4558</sup> - apply\_callback needs to invoke callback when applied locally
- Issue #744<sup>4559</sup> - CMake fixes
- Issue #743<sup>4560</sup> - Problem Building github version of HPX
- Issue #742<sup>4561</sup> - Remove HPX\_STD\_BIND
- Issue #741<sup>4562</sup> - assertion 'px != 0' failed: HPX(assertion\_failure) for low numbers of OS threads
- Issue #739<sup>4563</sup> - Performance counters do not count to the end of the program or evaluation
- Issue #738<sup>4564</sup> - Dedicated AGAS server runs don't work; console ignores -a option.
- Issue #737<sup>4565</sup> - Missing bind overloads
- Issue #736<sup>4566</sup> - Performance counter wildcards do not always work
- Issue #735<sup>4567</sup> - Create native ibverbs parcelport based on rdma operations
- Issue #734<sup>4568</sup> - Threads stolen performance counter total is incorrect
- Issue #733<sup>4569</sup> - Test benchmarks need to be checked and fixed
- Issue #732<sup>4570</sup> - Build fails with Mac, using mac ports clang-3.3 on latest git branch
- Issue #731<sup>4571</sup> - Add global start/stop API for performance counters
- Issue #730<sup>4572</sup> - Performance counter values are apparently incorrect

- Issue #43<sup>4645</sup> - Support for Darwin (Xcode + Clang)

## 2.10.20 HPX V0.9.5 (Jan 16, 2013)

We have had over 1000 commits since the last release and we have closed roughly 150 tickets (bugs, feature requests, etc.).

### General changes

This release is continuing along the lines of code and API consolidation, and overall usability improvements. We dedicated much attention to performance and we were able to significantly improve the threading and networking subsystems.

We successfully ported *HPX* to the Android platform. *HPX* applications now not only can run on mobile devices, but we support heterogeneous applications running across architecture boundaries. At the Supercomputing Conference 2012 we demonstrated connecting Android tablets to simulations running on a Linux cluster. The Android tablet was used to query performance counters from the Linux simulation and to steer its parameters.

We successfully ported *HPX* to Mac OSX (using the Clang compiler). Thanks to Pyry Jahkola for contributing the corresponding patches. Please see the section `macos_installation` for more details.

We made a special effort to make *HPX* usable in highly concurrent use cases. Many of the *HPX* API functions which possibly take longer than 100 microseconds to execute now can be invoked asynchronously. We added uniform support for composing futures which simplifies to write asynchronous code. *HPX* actions (function objects encapsulating possibly concurrent remote function invocations) are now well integrated with all other API facilities such like `hpx::bind`.

All of the API has been aligned as much as possible with established paradigms. *HPX* now mirrors many of the facilities as defined in the C++11 Standard, such as `hpx::thread`, `hpx::function`, `hpx::future`, etc.

A lot of work has been put into improving the documentation. Many of the API functions are documented now, concepts are explained in detail, and examples are better described than before. The new documentation index enables finding information with lesser effort.

This is the first release of *HPX* we perform after the move to [Github](#)<sup>4646</sup>. This step has enabled a wider participation from the community and further encourages us in our decision to release *HPX* as a true open source library (*HPX* is licensed under the very liberal [Boost Software License](#)<sup>4647</sup>).

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is by far the longest list of newly implemented features and fixed issues for any of HPX' releases so far.

- Issue #666<sup>4648</sup> - Segfault on calling hpx::finalize twice
- Issue #665<sup>4649</sup> - Adding declaration num\_of\_cores
- Issue #662<sup>4650</sup> - pkgconfig is building wrong
- Issue #660<sup>4651</sup> - Need uninterrupt function
- Issue #659<sup>4652</sup> - Move our logging library into a different namespace
- Issue #658<sup>4653</sup> - Dynamic performance counter types are broken
- Issue #657<sup>4654</sup> - HPX v0.9.5 (RC1) hello\_world example segfaulting
- Issue #656<sup>4655</sup> - Define the affinity of parcel-pool, io-pool, and timer-pool threads
- Issue #654<sup>4656</sup> - Integrate the Boost auto\_index tool with documentation
- Issue #653<sup>4657</sup> - Make HPX build on OS X + Clang + libc++
- Issue #651<sup>4658</sup> - Add fine-grained control for thread pinning
- Issue #650<sup>4659</sup> - Command line no error message when using -hpx:(anything)
- Issue #645<sup>4660</sup> - Command line aliases don't work in [teletype]` `@file` `[c++]
- Issue #644<sup>4661</sup> - Terminated threads are not always properly cleaned up
- Issue #640<sup>4662</sup> - future\_data<T>::set\_on\_completed\_ used without locks
- Issue #638<sup>4663</sup> - hpx build with intel compilers fails on linux
- Issue #637<sup>4664</sup> - --copy-dt-needed-entries breaks with gold
- Issue #635<sup>4665</sup> - Boost V1.53 will add Boost.Lockfree and Boost.Atomic
- Issue #633<sup>4666</sup> - Re-add examples to final 0.9.5 release
- Issue #632<sup>4667</sup> - Example thread\_aware\_timer is broken
- Issue #631<sup>4668</sup> - FFT application throws error in parcellayer

<sup>4668</sup> <https://github.com/STELLAR-GROUP/hpx/issues/631>

- Issue #630<sup>4669</sup> - Event synchronization example is broken
- Issue #629<sup>4670</sup> - Waiting on futures hangs
- Issue #628<sup>4671</sup> - Add an HPX\_ALWAYS\_ASSERT macro
- Issue #625<sup>4672</sup> - Port coroutines context switch benchmark
- Issue #621<sup>4673</sup> - New INI section for stack sizes
- Issue #618<sup>4674</sup> - pkg\_config support does not work with a HPX debug build
- Issue #617<sup>4675</sup> - hpx/external/logging/boost/logging/detail/cache\_before\_init.hpp:139:67: error: ‘get\_thread\_id’ was not declared in this scope
- Issue #616<sup>4676</sup> - Change wait\_xxx not to use locking
- Issue #615<sup>4677</sup> - Revert visibility ‘fix’ (fb0b6b8245dad1127b0c25ebafd9386b3945cca9)
- Issue #614<sup>4678</sup> - Fix Dataflow linker error
- Issue #613<sup>4679</sup> - find\_here should throw an exception on failure
- Issue #612<sup>4680</sup> - Thread phase doesn’t show up in debug mode
- Issue #611<sup>4681</sup> - Make stack guard pages configurable at runtime (initialization time)
- Issue #610<sup>4682</sup> - Co-Locate Components
- Issue #609<sup>4683</sup> - future\_overhead
- Issue #608<sup>4684</sup> - --hpx:list-counter-infos problem
- Issue #607<sup>4685</sup> - Update Boost.Context based backend for coroutines
- Issue #606<sup>4686</sup> - 1d\_wave\_equation is not working
- Issue #605<sup>4687</sup> - Any C++ function that has serializable arguments and a serializable return type should be remotable
- Issue #604<sup>4688</sup> - Connecting localities isn’t working anymore
- Issue #603<sup>4689</sup> - Do not verify any ini entries read from a file
- Issue #602<sup>4690</sup> - Rename argument\_size to type\_size/ added implementation to get parcel size

<sup>4690</sup> <https://github.com/STELLAR-GROUP/hpx/issues/602>

- Issue #599<sup>4691</sup> - Enable locality specific command line options
- Issue #598<sup>4692</sup> - Need an API that accesses the performance counter reporting the system uptime
- Issue #597<sup>4693</sup> - compiling on ranger
- Issue #595<sup>4694</sup> - I need a place to store data in a thread self pointer
- Issue #594<sup>4695</sup> - 32/64 interoperability
- Issue #593<sup>4696</sup> - Warn if logging is disabled at compile time but requested at runtime
- Issue #592<sup>4697</sup> - Add optional argument value to --hpx:list-counters and --hpx:list-counter-infos
- Issue #591<sup>4698</sup> - Allow for wildcards in performance counter names specified with --hpx:print-counter
- Issue #590<sup>4699</sup> - Local promise semantic differences
- Issue #589<sup>4700</sup> - Create API to query performance counter names
- Issue #587<sup>4701</sup> - Add get\_num\_localities and get\_num\_threads to AGAS API
- Issue #586<sup>4702</sup> - Adjust local AGAS cache size based on number of localities
- Issue #585<sup>4703</sup> - Error while using counters in HPX
- Issue #584<sup>4704</sup> - counting argument size of actions, initial pass.
- Issue #581<sup>4705</sup> - Remove RemoteResult template parameter for future<>
- Issue #580<sup>4706</sup> - Add possibility to hook into actions
- Issue #578<sup>4707</sup> - Use angle brackets in HPX error dumps
- Issue #576<sup>4708</sup> - Exception incorrectly thrown when --help is used
- Issue #575<sup>4709</sup> - HPX(bad\_component\_type) with gcc 4.7.2 and boost 1.51
- Issue #574<sup>4710</sup> - --hpx:connect command line parameter not working correctly
- Issue #571<sup>4711</sup> - hpx::wait () (callback version) should pass the future to the callback function
- Issue #570<sup>4712</sup> - hpx::wait should operate on boost::arrays and std::lists
- Issue #569<sup>4713</sup> - Add a logging sink for Android

<sup>4713</sup> <https://github.com/STELLAR-GROUP/hpx/issues/569>

- Issue #568<sup>4714</sup> - 2-argument version of HPX\_DEFINE\_COMPONENT\_ACTION
- Issue #567<sup>4715</sup> - Connecting to a running HPX application works only once
- Issue #565<sup>4716</sup> - HPX doesn't shutdown properly
- Issue #564<sup>4717</sup> - Partial preprocessing of new component creation interface
- Issue #563<sup>4718</sup> - Add hpx::start/hpx::stop to avoid blocking main thread
- Issue #562<sup>4719</sup> - All command line arguments swallowed by hpx
- Issue #561<sup>4720</sup> - Boost.Tuple is not move aware
- Issue #558<sup>4721</sup> - boost::shared\_ptr<> style semantics/syntax for client classes
- Issue #556<sup>4722</sup> - Creation of partially preprocessed headers should be enabled for Boost newer than V1.50
- Issue #555<sup>4723</sup> - BOOST\_FORCEINLINE does not name a type
- Issue #554<sup>4724</sup> - Possible race condition in thread get\_id()
- Issue #552<sup>4725</sup> - Move enable client\_base
- Issue #550<sup>4726</sup> - Add stack size category 'huge'
- Issue #549<sup>4727</sup> - ShenEOS run seg-faults on single or distributed runs
- Issue #545<sup>4728</sup> - AUTOLOB broken for add\_hpx\_component
- Issue #542<sup>4729</sup> - FindHPX\_HDF5 still searches multiple times
- Issue #541<sup>4730</sup> - Quotes around application name in hpx::init
- Issue #539<sup>4731</sup> - Race condition occurring with new lightweight threads
- Issue #535<sup>4732</sup> - hpx\_run\_tests.py exits with no error code when tests are missing
- Issue #530<sup>4733</sup> - Thread description(<unknown>) in logs
- Issue #523<sup>4734</sup> - Make thread objects more lightweight
- Issue #521<sup>4735</sup> - hpx::error\_code is not usable for lightweight error handling
- Issue #520<sup>4736</sup> - Add full user environment to HPX logs

2.10. Releases

1815

- Issue #488<sup>4760</sup> - Adding OpenCL and OCLM support to HPX for the MSVC platform
- Issue #487<sup>4761</sup> - FindHPX.cmake problems
- Issue #485<sup>4762</sup> - Change distributing\_factory and binpacking\_factory to use bulk creation
- Issue #484<sup>4763</sup> - Change HPX\_DONT\_USE\_PREPROCESSED\_FILES to HPX\_USE\_PREPROCESSED\_FILES
- Issue #483<sup>4764</sup> - Memory counter for Windows
- Issue #479<sup>4765</sup> - strange errors appear when requesting performance counters on multiple nodes
- Issue #477<sup>4766</sup> - Create (global) timer for multi-threaded measurements
- Issue #472<sup>4767</sup> - Add partial preprocessing using Wave
- Issue #471<sup>4768</sup> - Segfault stack traces don't show up in release
- Issue #468<sup>4769</sup> - External projects need to link with internal components
- Issue #462<sup>4770</sup> - Startup/shutdown functions are called more than once
- Issue #458<sup>4771</sup> - Consolidate hpx::util::high\_resolution\_timer and hpx::util::high\_resolution\_clock
- Issue #457<sup>4772</sup> - index out of bounds in allgather\_and\_gate on 4 cores or more
- Issue #448<sup>4773</sup> - Make HPX compile with clang
- Issue #447<sup>4774</sup> - 'make tests' should execute tests on local installation
- Issue #446<sup>4775</sup> - Remove SVN-related code from the codebase
- Issue #444<sup>4776</sup> - race condition in smp
- Issue #441<sup>4777</sup> - Patched Boost.Serialization headers should only be installed if needed
- Issue #439<sup>4778</sup> - Components using HPX\_REGISTER\_STARTUP\_MODULE fail to compile with MSVC
- Issue #436<sup>4779</sup> - Verify that no locks are being held while threads are suspended
- Issue #435<sup>4780</sup> - Installing HPX should not clobber existing Boost installation
- Issue #434<sup>4781</sup> - Logging external component failed (Boost 1.50)
- Issue #433<sup>4782</sup> - Runtime crash when building all examples

- Issue #432<sup>4783</sup> - Dataflow hangs on 512 cores/64 nodes
- Issue #430<sup>4784</sup> - Problem with distributing factory
- Issue #424<sup>4785</sup> - File paths referring to XSL-files need to be properly escaped
- Issue #417<sup>4786</sup> - Make dataflow LCOs work out of the box by using partial preprocessing
- Issue #413<sup>4787</sup> - hpx\_svnversion.py fails on Windows
- Issue #412<sup>4788</sup> - Make hpx::error\_code equivalent to hpx::exception
- Issue #398<sup>4789</sup> - HPX clobbers out-of-tree application specific CMake variables (specifically CMAKE\_BUILD\_TYPE)
- Issue #394<sup>4790</sup> - Remove code generating random port numbers for network
- Issue #378<sup>4791</sup> - ShenEOS scaling issues
- Issue #354<sup>4792</sup> - Create a coroutines wrapper for Boost.Context
- Issue #349<sup>4793</sup> - Commandline option --localities=N/-lN should be necessary only on AGAS locality
- Issue #334<sup>4794</sup> - Add auto\_index support to cmake based documentation toolchain
- Issue #318<sup>4795</sup> - Network benchmarks
- Issue #317<sup>4796</sup> - Implement network performance counters
- Issue #310<sup>4797</sup> - Duplicate logging entries
- Issue #230<sup>4798</sup> - Add compile time option to disable thread debugging info
- Issue #171<sup>4799</sup> - Add an INI option to turn off deadlock detection independently of logging
- Issue #170<sup>4800</sup> - OSHL internal counters are incorrect
- Issue #103<sup>4801</sup> - Better diagnostics for multiple component/action registrations under the same name
- Issue #48<sup>4802</sup> - Support for Darwin (Xcode + Clang)
- Issue #21<sup>4803</sup> - Build fails with GCC 4.6

## 2.10.21 HPX V0.9.0 (Jul 5, 2012)

We have had roughly 800 commits since the last release and we have closed approximately 80 tickets (bugs, feature requests, etc.).

### General changes

- Significant improvements made to the usability of *HPX* in large-scale, distributed environments.
- Renamed `hpx::lcos::packaged_task` to `hpx::lcos::packaged_action` to reflect the semantic differences to a `packaged_task` as defined by the C++11 Standard<sup>4804</sup>.
- *HPX* now exposes `hpx::thread` which is compliant to the C++11 `std::thread` type except that it (purely locally) represents an *HPX* thread. This new type does not expose any of the remote capabilities of the underlying *HPX*-thread implementation.
- The type `hpx::lcos::future` is now compliant to the C++11 `std::future<>` type. This type can be used to synchronize both, local and remote operations. In both cases the control flow will ‘return’ to the future in order to trigger any continuation.
- The types `hpx::lcos::local::promise` and `hpx::lcos::local::packaged_task` are now compliant to the C++11 `std::promise<>` and `std::packaged_task<>` types. These can be used to create a future representing local work only. Use the types `hpx::lcos::promise` and `hpx::lcos::packaged_action` to wrap any (possibly remote) action into a future.
- `hpx::thread` and `hpx::lcos::future` are now cancelable.
- Added support for sequential and logic composition of `hpx::lcos::futures`. The member function `hpx::lcos::future::when` permits futures to be sequentially composed. The helper functions `hpx::wait_all`, `hpx::wait_any`, and `hpx::wait_n` can be used to wait for more than one future at a time.
- *HPX* now exposes `hpx::apply` and `hpx::async` as the preferred way of creating (or invoking) any deferred work. These functions are usable with various types of functions, function objects, and actions and provide a uniform way to spawn deferred tasks.
- *HPX* now utilizes `hpx::util::bind` to (partially) bind local functions and function objects, and also actions. Remote bound actions can have placeholders as well.
- *HPX* continuations are now fully polymorphic. The class `hpx::actions::forwarding_continuation` is an example of how the user can write their own types of continuations. It can be used to execute any function as an continuation of a particular action.
- Reworked the action invocation API to be fully conformant to normal functions. Actions can now be invoked using `hpx::apply`, `hpx::async`, or using the `operator()` implemented on actions. Actions themselves can now be cheaply instantiated as they do not have any members anymore.
- Reworked the lazy action invocation API. Actions can now be directly bound using `hpx::util::bind` by passing an action instance as the first argument.
- A minimal *HPX* program now looks like this:

```
#include <hpx/hpx_init.hpp>

int hpx_main()
{
 return hpx::finalize();
```

(continues on next page)

<sup>4804</sup> <http://www.open-std.org/jtc1/sc22/wg21>

(continued from previous page)

```

}

int main()
{
 return hpx::init();
}

```

This removes the immediate dependency on the [Boost.Program Options](#)<sup>4805</sup> library.

---

**Note:** This minimal version of an *HPX* program does not support any of the default command line arguments (such as –help, or command line options related to PBS). It is suggested to always pass `argc` and `argv` to *HPX* as shown in the example below.

---

- In order to support those, but still not to depend on [Boost.Program Options](#)<sup>4806</sup>, the minimal program can be written as:

```

#include <hpx/hpx_init.hpp>

// The arguments for hpx_main can be left off, which very similar to the
// behavior of ``main()`` as defined by C++.
int hpx_main(int argc, char* argv[])
{
 return hpx::finalize();
}

int main(int argc, char* argv[])
{
 return hpx::init(argc, argv);
}

```

- Added performance counters exposing the number of component instances which are alive on a given locality.
- Added performance counters exposing then number of messages sent and received, the number of parcels sent and received, the number of bytes sent and received, the overall time required to send and receive data, and the overall time required to serialize and deserialize the data.
- Added a new component: `hpx::components::binpacking_factory` which is equivalent to the existing `hpx::components::distributing_factory` component, except that it equalizes the overall population of the components to create. It exposes two factory methods, one based on the number of existing instances of the component type to create, and one based on an arbitrary performance counter which will be queried for all relevant localities.
- Added API functions allowing to access elements of the diagnostic information embedded in the given exception: `hpx::get_locality_id`, `hpx::get_host_name`, `hpx::get_process_id`, `hpx::get_function_name`, `hpx::get_file_name`, `hpx::get_line_number`, `hpx::get_os_thread`, `hpx::get_thread_id`, and `hpx::get_thread_description`.

<sup>4805</sup> [https://www.boost.org/doc/html/program\\_options.html](https://www.boost.org/doc/html/program_options.html)

<sup>4806</sup> [https://www.boost.org/doc/html/program\\_options.html](https://www.boost.org/doc/html/program_options.html)

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #71<sup>4807</sup> - GIDs that are not serialized via `handle_gid<>` should raise an exception
- Issue #105<sup>4808</sup> - Allow for `hpx::util::functions` to be registered in the AGAS symbolic namespace
- Issue #107<sup>4809</sup> - Nasty threadmanger race condition (reproducible in `sheneos_test`)
- Issue #108<sup>4810</sup> - Add millisecond resolution to *HPX* logs on Linux
- Issue #110<sup>4811</sup> - Shutdown hang in distributed with release build
- Issue #116<sup>4812</sup> - Don't use TSS for the applier and runtime pointers
- Issue #162<sup>4813</sup> - Move local synchronous execution shortcut from `hpx::function` to the applier
- Issue #172<sup>4814</sup> - Cache sources in CMake and check if they change manually
- Issue #178<sup>4815</sup> - Add an INI option to turn off ranged-based AGAS caching
- Issue #187<sup>4816</sup> - Support for disabling performance counter deployment
- Issue #202<sup>4817</sup> - Support for sending performance counter data to a specific file
- Issue #218<sup>4818</sup> - `boost.coroutines` allows different stack sizes, but stack pool is unaware of this
- Issue #231<sup>4819</sup> - Implement movable `boost::bind`
- Issue #232<sup>4820</sup> - Implement movable `boost::function`
- Issue #236<sup>4821</sup> - Allow binding `hpx::util::function` to actions
- Issue #239<sup>4822</sup> - Replace `hpx::function` with `hpx::util::function`
- Issue #240<sup>4823</sup> - Can't specify `RemoteResult` with `lcos::async`
- Issue #242<sup>4824</sup> - `REGISTER_TEMPLATE` support for plain actions
- Issue #243<sup>4825</sup> - `handle_gid<>` support for `hpx::util::function`
- Issue #245<sup>4826</sup> - `*_c_cache` code throws an exception if the queried GID is not in the local cache
- Issue #246<sup>4827</sup> - Undefined references in dataflow/adaptive1d example

<sup>4868</sup> <https://github.com/STELLAR-GROUP/hpx/issues/426>

## General changes

- HPX does not need to be installed anymore to be functional.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this point release:

- Issue #295<sup>4869</sup> - Don't require install path to be known at compile time.
- Issue #371<sup>4870</sup> - Add hpx iostreams to standard build.
- Issue #384<sup>4871</sup> - Fix compilation with GCC 4.7.
- Issue #390<sup>4872</sup> - Remove keep\_factory\_alive startup call from ShenEOS; add shutdown call to H5close.
- Issue #393<sup>4873</sup> - Thread affinity control is broken.

## Bug fixes (commits)

Here is a list of the important commits included in this point release:

- r7642 - External: Fix backtrace memory violation.
- **r7775 - Components: Fix symbol visibility bug with component startup** providers. This prevents one components providers from overriding another components.
- r7778 - Components: Fix startup/shutdown provider shadowing issues.

## 2.10.23 HPX V0.8.0 (Mar 23, 2012)

We have had roughly 1000 commits since the last release and we have closed approximately 70 tickets (bugs, feature requests, etc.).

## General changes

- Improved PBS support, allowing for arbitrary naming schemes of node-hostnames.
- Finished verification of the reference counting framework.
- Implemented decrement merging logic to optimize the distributed reference counting system.
- Restructured the LCO framework. Renamed `hpx::lcos::eager_future<>` and `hpx::lcos::lazy_future<>` into `hpx::lcos::packaged_task` and `hpx::lcos::deferred_packaged_task`. Split `hpx::lcos::promise` into `hpx::lcos::packaged_task` and `hpx::lcos::future`. Added 'local' futures (in namespace `hpx::lcos::local`).
- Improved the general performance of local and remote action invocations. This (under certain circumstances) drastically reduces the number of copies created for each of the parameters and return values.

<sup>4869</sup> <https://github.com/STELLAR-GROUP/hpx/issues/295>

<sup>4870</sup> <https://github.com/STELLAR-GROUP/hpx/issues/371>

<sup>4871</sup> <https://github.com/STELLAR-GROUP/hpx/issues/384>

<sup>4872</sup> <https://github.com/STELLAR-GROUP/hpx/issues/390>

<sup>4873</sup> <https://github.com/STELLAR-GROUP/hpx/issues/393>

- Reworked the performance counter framework. Performance counters are now created only when needed, which reduces the overall resource requirements. The new framework allows for much more flexible creation and management of performance counters. The new sine example application demonstrates some of the capabilities of the new infrastructure.
- Added a buildbot-based continuous build system which gives instant, automated feedback on each commit to SVN.
- Added more automated tests to verify proper functioning of *HPX*.
- Started to create documentation for *HPX* and its API.
- Added documentation toolchain to the build system.
- Added dataflow LCO.
- Changed default *HPX* command line options to have `hpx:` prefix. For instance, the former option `--threads` is now `--hpx:threads`. This has been done to make ambiguities with possible application specific command line options as unlikely as possible. See the section *HPX Command Line Options* for a full list of available options.
- Added the possibility to define command line aliases. The former short (one-letter) command line options have been predefined as aliases for backwards compatibility. See the section *HPX Command Line Options* for a detailed description of command line option aliasing.
- Network connections are now cached based on the connected host. The number of simultaneous connections to a particular host is now limited. Parcels are buffered and bundled if all connections are in use.
- Added more refined thread affinity control. This is based on the external library Portable Hardware Locality (HWLOC).
- Improved support for Windows builds with CMake.
- Added support for components to register their own command line options.
- Added the possibility to register custom startup/shutdown functions for any component. These functions are guaranteed to be executed by an *HPX* thread.
- Added two new experimental thread schedulers: `hierarchy_scheduler` and `periodic_priority_scheduler`. These can be activated by using the command line options `--hpx:queuing=hierarchy` or `--hpx:queuing=periodic`.

## Example applications

- Graph500 performance benchmark<sup>4874</sup> (thanks to Matthew Anderson for contributing this application).
- GTC (Gyrokinetic Toroidal Code)<sup>4875</sup>: a skeleton for particle in cell type codes.
- Random Memory Access: an example demonstrating random memory accesses in a large array
- ShenEOS example<sup>4876</sup>, demonstrating partitioning of large read-only data structures and exposing an interpolation API.
- Sine performance counter demo.
- Accumulator examples demonstrating how to write and use *HPX* components.
- Quickstart examples (like `hello_world`, `fibonacci`, `quicksort`, `factorial`, etc.) demonstrating simple *HPX* concepts which introduce some of the concepts in *HPX*.

---

<sup>4874</sup> <http://www.graph500.org/>

<sup>4875</sup> <http://www.nersc.gov/research-and-development/benchmarking-and-workload-characterization/nersc-6-benchmarks/gtc/>

<sup>4876</sup> <http://stellarcollapse.org/equationofstate>

- Load balancing and work stealing demos.

## API changes

- Moved all local LCOs into a separate namespace `hpx::lcos::local` (for instance, `hpx::lcos::local_mutex` is now `hpx::lcos::local::mutex`).
- Replaced `hpx::actions::function` with `hpx::util::function`. Cleaned up related code.
- Removed `hpx::traits::handle_gid` and moved handling of global reference counts into the corresponding serialization code.
- Changed terminology: `prefix` is now called `locality_id`, renamed the corresponding API functions (such as `hpx::get_prefix`, which is now called `hpx::get_locality_id`).
- Adding `hpx::find_remote_localities`, and `hpx::get_num_localities`.
- Changed performance counter naming scheme to make it more bash friendly. The new performance counter naming scheme is now

```
/object{parentname#parentindex/instance#index}/counter#parameters
```

- Added `hpx::get_worker_thread_num` replacing `hpx::threadmanager_base::get_thread_num`.
- Renamed `hpx::get_num_os_threads` to `hpx::get_os_threads_count`.
- Added `hpx::threads::get_thread_count`.
- Restructured the Futures sub-system, renaming types in accordance with the terminology used by the C++11 ISO standard.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #31<sup>[4877](#)</sup> - Specialize handle\_gid<> for examples and tests
- Issue #72<sup>[4878](#)</sup> - Fix AGAS reference counting
- Issue #104<sup>[4879](#)</sup> - heartbeat throws an exception when derefing the performance counter it's watching
- Issue #111<sup>[4880](#)</sup> - throttle causes an exception on the target application
- Issue #142<sup>[4881](#)</sup> - One failed component loading causes an unrelated component to fail
- Issue #165<sup>[4882](#)</sup> - Remote exception propagation bug in AGAS reference counting test
- Issue #186<sup>[4883](#)</sup> - Test credit exhaustion/splitting (e.g. prepare\_gid and symbol NS)
- Issue #188<sup>[4884](#)</sup> - Implement remaining AGAS reference counting test cases
- Issue #258<sup>[4885](#)</sup> - No type checking of GIDs in stubs classes

- Issue #323<sup>4910</sup> - Credit exhaustion causes object to stay alive
- Issue #324<sup>4911</sup> - Duplicate exception messages
- Issue #326<sup>4912</sup> - Integrate Quickbook with CMake
- Issue #329<sup>4913</sup> - --help and --version should still work
- Issue #330<sup>4914</sup> - Create pkg-config files
- Issue #337<sup>4915</sup> - Improve usability of performance counter timestamps
- Issue #338<sup>4916</sup> - Non-std exceptions deriving from std::exceptions in tfunc may be sliced
- Issue #339<sup>4917</sup> - Decrease the number of send\_pending\_parcels threads
- Issue #343<sup>4918</sup> - Dynamically setting the stack size doesn't work
- Issue #351<sup>4919</sup> - 'make install' does not update documents
- Issue #353<sup>4920</sup> - Disable FIXMEs in the docs by default; add a doc developer CMake option to enable FIXMEs
- Issue #355<sup>4921</sup> - 'make' doesn't do anything after correct configuration
- Issue #356<sup>4922</sup> - Don't use hpx::util::static\_ in topology code
- Issue #359<sup>4923</sup> - Infinite recursion in hpx::tuple serialization
- Issue #361<sup>4924</sup> - Add compile time option to disable logging completely
- Issue #364<sup>4925</sup> - Installation seriously broken in r7443

## 2.10.24 HPX V0.7.0 (Dec 12, 2011)

We have had roughly 1000 commits since the last release and we have closed approximately 120 tickets (bugs, feature requests, etc.).

<sup>4925</sup> <https://github.com/STELLAR-GROUP/hpx/issues/364>

## General changes

- Completely removed code related to deprecated AGAS V1, started to work on AGAS V2.1.
- Started to clean up and streamline the exposed APIs (see ‘API changes’ below for more details).
- Revamped and unified performance counter framework, added a lot of new performance counter instances for monitoring of a diverse set of internal *HPX* parameters (queue lengths, access statistics, etc.).
- Improved general error handling and logging support.
- Fixed several race conditions, improved overall stability, decreased memory footprint, improved overall performance (major optimizations include native TLS support and ranged-based AGAS caching).
- Added support for running *HPX* applications with PBS.
- Many updates to the build system, added support for gcc 4.5.x and 4.6.x, added C++11 support.
- Many updates to default command line options.
- Added many tests, set up buildbot for continuous integration testing.
- Better shutdown handling of distributed applications.

## Example applications

- quickstart/factorial and quickstart/fibonacci, future-recursive parallel algorithms.
- quickstart/hello\_world, distributed hello world example.
- quickstart/rma, simple remote memory access example
- quickstart/quicksort, parallel quicksort implementation.
- gtc, gyrokinetic torodial code.
- bfs, breadth-first-search, example code for a graph application.
- sheneos, partitioning of large data sets.
- accumulator, simple component example.
- balancing/os\_thread\_num, balancing/px\_thread\_phase, examples demonstrating load balancing and work stealing.

## API changes

- Added `hpx::find_all_localities`.
- Added `hpx::terminate` for non-graceful termination of applications.
- Added `hpx::lcos::async` functions for simpler asynchronous programming.
- Added new AGAS interface for handling of symbolic namespace (`hpx::agas::*`).
- Renamed `hpx::components::wait` to `hpx::lcos::wait`.
- Renamed `hpx::lcos::future_value` to `hpx::lcos::promise`.
- Renamed `hpx::lcos::recursive_mutex` to `hpx::lcos::local_recursive_mutex`,  
`hpx::lcos::mutex` to `hpx::lcos::local_mutex`
- Removed support for Boost versions older than V1.38, recommended Boost version is now V1.47 and newer.
- Removed `hpx::process` (this will be replaced by a real process implementation in the future).

- Removed non-functional LCO code (`hpx::lcos::dataflow`, `hpx::lcos::thunk`, `hpx::lcos::dataflow_variable`).
- Removed deprecated `hpx::naming::full_address`.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #28<sup>4926</sup> - Integrate Windows/Linux CMake code for *HPX* core
- Issue #32<sup>4927</sup> - `hpx::cout()` should be `hpx::cout`
- Issue #33<sup>4928</sup> - AGAS V2 legacy client does not properly handle `error_code`
- Issue #60<sup>4929</sup> - AGAS: allow for registerid to optionally take ownership of the gid
- Issue #62<sup>4930</sup> - adaptive1d compilation failure in Fusion
- Issue #64<sup>4931</sup> - Parcel subsystem doesn't resolve domain names
- Issue #83<sup>4932</sup> - No error handling if no console is available
- Issue #84<sup>4933</sup> - No error handling if a hosted locality is treated as the bootstrap server
- Issue #90<sup>4934</sup> - Add general commandline option -N
- Issue #91<sup>4935</sup> - Add possibility to read command line arguments from file
- Issue #92<sup>4936</sup> - Always log exceptions/errors to the log file
- Issue #93<sup>4937</sup> - Log the command line/program name
- Issue #95<sup>4938</sup> - Support for distributed launches
- Issue #97<sup>4939</sup> - Attempt to create a bad component type in AMR examples
- Issue #100<sup>4940</sup> - factorial and factorial\_get examples trigger AGAS component type assertions
- Issue #101<sup>4941</sup> - Segfault when `hpx::process::here()` is called in fibonacci2
- Issue #102<sup>4942</sup> - unknown\_component\_address in int\_object\_semaphore\_client
- Issue #114<sup>4943</sup> - marduk raises assertion with default parameters
- Issue #115<sup>4944</sup> - Logging messages for SMP runs (on the console) shouldn't be buffered

## 2.11 Citing HPX

Please cite *HPX* whenever you use it for publications. Use our paper in The Journal of Open Source Software as the main citation for *HPX*:<sup>5002</sup>. Use the Zenodo entry for referring to the latest version of *HPX*:<sup>5003</sup>. Entries for citing specific versions of *HPX* can also be found at<sup>5004</sup>.

## 2.12 HPX users

A list of institutions and projects using *HPX* can be found on the *HPX* Users<sup>5005</sup> page.

## 2.13 About HPX

### 2.13.1 History

The development of High Performance ParalleX (*HPX*) began in 2007. At that time, Hartmut Kaiser became interested in the work done by the ParalleX group at the Center for Computation and Technology (CCT)<sup>5006</sup>, a multi-disciplinary research institute at Louisiana State University (LSU)<sup>5007</sup>. The ParalleX group was working to develop a new and

experimental execution model for future high performance computing architectures. This model was christened ParalleX. The first implementations of ParalleX were crude, and many of those designs had to be discarded entirely. However, over time the team learned quite a bit about how to design a parallel, distributed runtime system which implements the concepts of ParalleX.

From the very beginning, this endeavour has been a group effort. In addition to a handful of interested researchers, there have always been graduate and undergraduate students participating in the discussions, design, and implementation of *HPX*. In 2011 we decided to formalize our collective research efforts by creating the STE||AR<sup>5008</sup> group (Systems Technology, Emergent Parallelism, and Algorithm Research). Over time, the team grew to include researchers around the country and the world. In 2014, the STE||AR<sup>5009</sup> Group was reorganized to become the international community it is today. This consortium of researchers aims to develop stable, sustainable, and scalable tools which will enable application developers to exploit the parallelism latent in the machines of today and tomorrow. Our goal of the *HPX* project is to create a high quality, freely available, open source implementation of ParalleX concepts for conventional and future systems by building a modular and standards conforming runtime system for SMP and distributed application environments. The API exposed by *HPX* is conformant to the interfaces defined by the C++ ISO Standard and adheres to the programming guidelines used by the Boost<sup>5010</sup> collection of C++ libraries. We steer the development of *HPX* with real world applications and aim to provide a smooth migration path for domain scientists.

To learn more about STE||AR<sup>5011</sup> and ParalleX, see *People* and *Why HPX?*.

## 2.13.2 People

The STE||AR<sup>5012</sup> Group (pronounced as stellar) stands for “Systems Technology, Emergent Parallelism, and Algorithm Research”. We are an international group of faculty, researchers, and students working at various institutions around the world. The goal of the STE||AR<sup>5013</sup> Group is to promote the development of scalable parallel applications by providing a community for ideas, a framework for collaboration, and a platform for communicating these concepts to the broader community.

Our work is focused on building technologies for scalable parallel applications. *HPX*, our general purpose C++ runtime system for parallel and distributed applications, is no exception. We use *HPX* for a broad range of scientific applications, helping scientists and developers to write code which scales better and shows better performance compared to more conventional programming models such as MPI.

*HPX* is based on *ParalleX* which is a new (and still experimental) parallel execution model aiming to overcome the limitations imposed by the current hardware and the techniques we use to write applications today. Our group focuses on two types of applications - those requiring excellent strong scaling, allowing for a dramatic reduction of execution time for fixed workloads and those needing highest level of sustained performance through massive parallelism. These applications are presently unable (through conventional practices) to effectively exploit a relatively small number of cores in a multi-core system. By extension, these application will not be able to exploit high-end exascale computing systems which are likely to employ hundreds of millions of such cores by the end of this decade.

Critical bottlenecks to the effective use of new generation high performance computing (HPC) systems include:

- *Starvation*: due to lack of usable application parallelism and means of managing it,
- *Overhead*: reduction to permit strong scalability, improve efficiency, and enable dynamic resource management,
- *Latency*: from remote access across system or to local memories,
- *Contention*: due to multicore chip I/O pins, memory banks, and system interconnects.

<sup>5008</sup> <https://stellar-group.org>

<sup>5009</sup> <https://stellar-group.org>

<sup>5010</sup> <https://www.boost.org/>

<sup>5011</sup> <https://stellar-group.org>

<sup>5012</sup> <https://stellar-group.org>

<sup>5013</sup> <https://stellar-group.org>

The ParalleX model has been devised to address these challenges by enabling a new computing dynamic through the application of message-driven computation in a global address space context with lightweight synchronization. The work on *HPX* is centered around implementing the concepts as defined by the ParalleX model. *HPX* is currently targeted at conventional machines, such as classical Linux based Beowulf clusters and SMP nodes.

We fully understand that the success of *HPX* (and ParalleX) is very much the result of the work of many people. To see a list of who is contributing see our tables below.

## HPX contributors

## Acknowledgements

Thanks also to the following people who contributed directly or indirectly to the project through discussions, pull requests, documentation patches, etc.

- Srinivas Yadav, for his work on SIMD support in algorithms before and during Google Summer of Code 2021.
- Akhil Nair, for his work on adapting algorithms to C++20 before and during Google Summer of Code 2021.
- Alexander Toktarev, for updating the parallel algorithm customization points to use `tag_fallback_invoke` for the default implementations.
- Brice Goglin, for reporting and helping fix issues related to the integration of hwloc in *HPX*.
- Giannis Gonidelis, for his work on the ranges adaptation during the Google Summer of Code 2020.
- Auriane Reverdell (Swiss National Supercomputing Centre<sup>5051</sup>), for her tireless work on refactoring our CMake setup and modularizing *HPX*.
- Christopher Hinz, for his work on refactoring our CMake setup.
- Weile Wei, for fixing *HPX* builds with CUDA on Summit.
- Severin Strobl, for fixing our CMake setup related to linking and adding new entry points to the *HPX* runtime.
- Rebecca Stobaugh, for her major documentation review and contributions during and after the 2019 Google Season of Documentation.
- Jan Melech, for adding automatic serialization of simple structs.
- Austin McCartney, for adding concept emulation of the Ranges TS bidirectional and random access iterator concepts.
- Marco Diers, reporting and fixing issues related PMIx.
- Maximilian Bremer, for reporting multiple issues and extending the component migration tests.
- Piotr Mikolajczyk, for his improvements and fixes to the set and count algorithms.
- Grant Rostig, for reporting several deficiencies on our web pages.
- Jakub Golinowski, for implementing an *HPX* backend for OpenCV and in the process improving documentation and reporting issues.
- Mikael Simberg (Swiss National Supercomputing Centre<sup>5052</sup>), for his tireless help cleaning up and maintaining *HPX*.
- Tianyi Zhang, for his work on HPXMP.
- Shahrzad Shirzad, for her contributions related to Phylanx.
- Christopher Ogle, for his contributions to the parallel algorithms.
- Surya Priy, for his work with statistic performance counters.
- Anushi Maheshwari, for her work on random number generation.
- Bruno Pitrus, for his work with parallel algorithms.
- Nikunj Gupta, for rewriting the implementation of `hpx_main.hpp` and for his fixes for tests.
- Christopher Taylor, for his interest in *HPX* and the fixes he provided.
- Shoshana Jakobovits, for her work on the resource partitioner.

---

<sup>5051</sup> <https://www.cscs.ch>

<sup>5052</sup> <https://www.cscs.ch>

- Denis Blank, who re-wrote our unwrapped function to accept plain values arbitrary containers, and properly deal with nested futures.
- Ajai V. George, who implemented several of the parallel algorithms.
- Taeguk Kwon, who worked on implementing parallel algorithms as well as adapting the parallel algorithms to the Ranges TS.
- Zach Byerly ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>5053</sup>), who in his work developing applications on top of *HPX* opened tickets and contributed to the *HPX* examples.
- Daniel Estermann, for his work porting *HPX* to the Raspberry Pi.
- Alireza Kheirkhahan ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>5054</sup>), who built and administered our local cluster as well as his work in distributed IO.
- Abhimanyu Rawat, who worked on stack overflow detection.
- David Pfander, who improved signal handling in *HPX*, provided his optimization expertise, and worked on incorporating the Vc vectorization into *HPX*.
- Denis Demidov, who contributed his insights with VexCL.
- Khalid Hasanov, who contributed changes which allowed to run *HPX* on 64Bit power-pc architectures.
- Zahra Khatami ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>5055</sup>), who contributed the prefetching iterators and the persistent auto chunking executor parameters implementation.
- Marcin Copik, who worked on implementing GPU support for C++AMP and HCC. He also worked on implementing a HCC backend for *HPX.Compute*.
- Minh-Khanh Do, who contributed the implementation of several segmented algorithms.
- Bibek Wagle ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>5056</sup>), who worked on fixing and analyzing the performance of the *parcel* coalescing plugin in *HPX*.
- Lukas Troska, who reported several problems and contributed various test cases allowing to reproduce the corresponding issues.
- Andreas Schaefer, who worked on integrating his library ([LibGeoDecomp](https://www.libgeodecomp.org/)<sup>5057</sup>) with *HPX*. He reported various problems and submitted several patches to fix issues allowing for a better integration with [LibGeoDecomp](https://www.libgeodecomp.org/)<sup>5058</sup>.
- Satyaki Upadhyay, who contributed several examples to *HPX*.
- Brandon Cordes, who contributed several improvements to the inspect tool.
- Harris Brakmic, who contributed an extensive build system description for building *HPX* with Visual Studio.
- Parsa Amini ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>5059</sup>), who refactored and simplified the implementation of AGAS in *HPX* and who works on its implementation and optimization.
- Luis Martinez de Bartolome who implemented a build system extension for *HPX* integrating it with the [Conan](https://www.conan.io/)<sup>5060</sup> C/C++ package manager.
- Vinay C Amatya ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>5061</sup>), who contributed to the documentation and provided some of the *HPX* examples.

<sup>5053</sup> <https://www.lsu.edu><sup>5054</sup> <https://www.lsu.edu><sup>5055</sup> <https://www.lsu.edu><sup>5056</sup> <https://www.lsu.edu><sup>5057</sup> <https://www.libgeodecomp.org/><sup>5058</sup> <https://www.libgeodecomp.org/><sup>5059</sup> <https://www.lsu.edu><sup>5060</sup> <https://www.conan.io/><sup>5061</sup> <https://www.lsu.edu>

- Kevin Huck and Nick Chaimov ([University of Oregon](https://uoregon.edu/)<sup>5062</sup>), who contributed the integration of APEX (Autonomic Performance Environment for eXascale) with *HPX*.
- Francisco Jose Tapia, who helped with implementing the parallel sort algorithm for *HPX*.
- Patrick Diehl, who worked on implementing CUDA support for our companion library targeting GPGPUs ([HPXCL](https://github.com/STELLAR-GROUP/hpxcl/)<sup>5063</sup>).
- Eric Lemanissier contributed fixes to allow compilation using the MingW toolchain.
- Nidhi Makhijani who helped cleaning up some enum consistencies in *HPX* and contributed to the resource manager used in the thread scheduling subsystem. She also worked on *HPX* in the context of the Google Summer of Code 2015.
- Larry Xiao, Devang Bacharwar, Marcin Copik, and Konstantin Kronfeldner who worked on *HPX* in the context of the Google Summer of Code program 2015.
- Daniel Bourgeois ([Center for Computation and Technology \(CCT\)](https://www.cct.lsu.edu/)<sup>5064</sup>) who contributed to *HPX* the implementation of several parallel algorithms (as proposed by [N4313](http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2014/n4313.html)<sup>5065</sup>).
- Anuj Sharma and Christopher Bross ([Department of Computer Science 3 - Computer Architecture](https://www3.cs.fau.de/)<sup>5066</sup>), who worked on *HPX* in the context of the [Google Summer of Code](https://www.nvidia.com/object/cuda_home_new.html)<sup>5067</sup> program 2014.
- Martin Stumpf ([Department of Computer Science 3 - Computer Architecture](https://www3.cs.fau.de/)<sup>5068</sup>), who rebuilt our contiguous testing infrastructure (see the [HPX Buildbot Website](https://github.com/STELLAR-GROUP/hpxcl/)<sup>5069</sup>). Martin is also working on [HPXCL](https://www.khronos.org/opencl/)<sup>5070</sup> (mainly all work related to [OpenCL](https://www.khronos.org/opencl/)<sup>5071</sup>) and implementing an *HPX* backend for [POCL](https://www.khronos.org/opencl/)<sup>5072</sup>, a portable computing language solution based on OpenCL<sup>5073</sup>.
- Grant Mercer ([University of Nevada, Las Vegas](https://uoregon.edu/)<sup>5074</sup>), who helped creating many of the parallel algorithms (as proposed by [N4313](http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2014/n4313.html)<sup>5075</sup>).
- Damond Howard ([Louisiana State University \(LSU\)](https://www3.cs.fau.de/)<sup>5076</sup>), who works on [HPXCL](https://www3.cs.fau.de/)<sup>5077</sup> (mainly all work related to [CUDA](https://www.nvidia.com/object/cuda_home_new.html)<sup>5078</sup>).
- Christoph Junghans (Los Alamos National Lab), who helped making our buildsystem more portable.
- Antoine Tran Tan ([Laboratoire de Recherche en Informatique, Paris](https://www3.cs.fau.de/)), who worked on integrating *HPX* as a backend for [NT2](https://www3.cs.fau.de/)<sup>5079</sup>. He also contributed an implementation of an API similar to Fortran co-arrays on top of *HPX*.
- John Biddiscombe ([Swiss National Supercomputing Centre](https://www3.cs.fau.de/)<sup>5080</sup>), who helped with the BlueGene/Q port of *HPX*, implemented the parallel sort algorithm, and made several other contributions.
- Erik Schnetter (Perimeter Institute for Theoretical Physics), who greatly helped to make *HPX* more robust by submitting a large amount of problem reports, feature requests, and made several direct contributions.

<sup>5080</sup> <https://www.cscs.ch>

- Mathias Gaunard (Metascale), who contributed several patches to reduce compile time warnings generated while compiling *HPX*.
- Andreas Buhr, who helped with improving our documentation, especially by suggesting some fixes for inconsistencies.
- Patricia Grubel ([New Mexico State University](https://www.nmsu.edu)<sup>5081</sup>), who contributed the description of the different *HPX* thread scheduler policies and is working on the performance analysis of our thread scheduling subsystem.
- Lars Viklund, whose wit, passion for testing, and love of odd architectures has been an amazing contribution to our team. He has also contributed platform specific patches for FreeBSD and MSVC12.
- Agustín Berge, who contributed patches fixing some very nasty hidden template meta-programming issues. He rewrote large parts of the API elements ensuring strict conformance with the C++ ISO Standard.
- Anton Bikineev for contributing changes to make using `boost::lexical_cast` safer, he also contributed a thread safety fix to the iostreams module. He also contributed a complete rewrite of the serialization infrastructure replacing Boost.Serialization inside *HPX*.
- Pyry Jähkälä, who contributed the Mac OS build system and build documentation on how to build *HPX* using Clang and libc++.
- Mario Mulansky, who created an *HPX* backend for his Boost.Odeint library, and who submitted several test cases allowing us to reproduce and fix problems in *HPX*.
- Rekha Raj, who contributed changes to the description of the Windows build instructions.
- Jeremy Kemp how worked on an *HPX* OpenMP backend and added regression tests.
- Alex Nagelberg for his work on implementing a C wrapper API for *HPX*.
- Chen Guo, helvihartmann, Nicholas Pezolano, and John West who added and improved examples in *HPX*.
- Joseph Kleinhenz, Markus Elfring, Kirill Kropivnyansky, Alexander Neundorf, Bryant Lam, and Alex Hirsch who improved our CMake.
- Tapasweni Pathak, Praveen Velliengiri, Jean-Loup Tastet, Michael Levine, Aalekh Nigam, HadrienG2, Prayag Verma, Islada, Alex Myczko, and Avyav Kumar who improved the documentation.
- Jayesh Badwaik, J. F. Bastien, Christoph Garth, Christopher Hinz, Brandon Kohn, Mario Lang, Maikel Nadolski, pierrele, hendrx, Dekken, woodmeister123, xaguilar, Andrew Kemp, Dylan Stark, Matthew Anderson, Jeremy Wilke, Jiazheng Yuan, CyberDrudge, david8dixon, Maxwell Reeser, Raffaele Solca, Marco Ippolito, Jules Penuchot, Weile Wei, Severin Strobl, Kor de Jong, albestro, Jeff Trull, Yuri Victorovich, and Gregor Daiß who contributed to the general improvement of *HPX*.

*HPX* Funding Acknowledgements<sup>5082</sup> lists current and past funding sources for *HPX*.
