Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [*first*, *last*) to another range beginning at *result* in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment $*(\text{result} + (\text{last} - \text{first}) - 1 - i) = *(first + i)$ once for each non-negative $i < (\text{last} - \text{first})$. If the source and destination ranges (that is, [*first*, *last*) and [*result*, *result*+(*last*-*first*)) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns The *reverse_copy* algorithm returns a *hpx::future<ranges::reverse_copy_result<hpx::traits::range_iterator_t<Rng>, OutIter>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::reverse_copy_result<hpx::traits::range_iterator_t<Rng>, OutIter>* otherwise. The *reverse_copy* algorithm returns an object equal to {*last*, *result* + N} where N = *last - first*

hpx::ranges::rotate, hpx::ranges::rotate_copy

Defined in header `hpx/algorithms.hpp`⁶⁶¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename FwdIter, typename Sent>
subrange_t<FwdIter, Sent> rotate(FwdIter first, FwdIter middle, Sent last)
```

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element *middle* becomes the first element of the new range and *middle - 1* becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns The *rotate* algorithm returns a *subrange_t*<*FwdIter*, *Sent*>. The *rotate* algorithm returns the iterator equal to pair(first + (last - middle), last).

```
template<typename ExPolicy, typename FwdIter, typename Sent>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type rotate(ExPolicy
&&policy,
FwdIter
first,
FwdIter
middle,
Sent last)
```

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range

⁶⁶¹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

[first, last) in such a way that the element middle becomes the first element of the new range and middle - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns The *rotate* algorithm returns a *hpx::future<subrange_t<FwdIter, Sent>>* if the execution policy is of type *parallel_task_policy* and returns a *subrange_t<FwdIter, Sent>* otherwise. The *rotate* algorithm returns the iterator equal to pair(*first* + (*last* - *middle*), *last*).

```
template<typename Rng>
subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>> rotate(Rng
    &&rng,
    hpx::traits::range_iterator_t<Rng> middle)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters *Rng* – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

Parameters

- ***rng*** – Refers to the sequence of elements the algorithm will be applied to.
- ***middle*** – Refers to the element that should appear at the beginning of the rotated range.

Returns The *rotate* algorithm returns a *subrange_t*<*hpx::traits::range_iterator_t<Rng>*, *hpx::traits::range_iterator_t<Rng>*>. The *rotate* algorithm returns the iterator equal to pair(first + (last - middle), last).

template<typename **ExPolicy**, typename **Rng**>

parallel::util::detail::algorithm_result<ExPolicy, subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element *middle* becomes the first element of the new range and *middle - 1* becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- ***ExPolicy*** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- ***Rng*** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

Parameters

- ***policy*** – The execution policy to use for the scheduling of the iterations.
- ***rng*** – Refers to the sequence of elements the algorithm will be applied to.
- ***middle*** – Refers to the element that should appear at the beginning of the rotated range.

Returns The *rotate* algorithm returns a *hpx::future* <*subrange_t*<*hpx::traits::range_iterator_t<Rng>*, *hpx::traits::range_iterator_t<Rng>*>> if

the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>*. otherwise. The *rotate* algorithm returns the iterator equal to pair(first + (last - middle), last).

```
template<typename FwdIter, typename Sent, typename OutIter>
rotate_copy_result<FwdIter, OutIter> rotate_copy(FwdIter first, FwdIter middle, Sent last, OutIter dest_first)
```

Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for **FwdIter**.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first, last).

Returns The *rotate_copy* algorithm returns a *rotate_copy_result<FwdIter, OutIter>*. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2>
parallel::util::detail::algorithm_result<ExPolicy, rotate_copy_result<FwdIter1, FwdIter2>>::type rotate_copy(ExPolicy&&policy,
FwdIter1 first,
FwdIter1 middle,
Sent last,
FwdIter2 dest_first)
```

Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

Returns The *rotate_copy* algorithm returns areturns `hpx::future<rotate_copy_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `rotate_copy_result<FwdIter1, FwdIter2>` otherwise. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

```
template<typename Rng, typename OutIter>
rotate_copy_result<hpx::traits::range\_iterator\_t<Rng>, OutIter> rotate_copy(Rng &&rng,
hpx::traits::range\_iterator\_t<Rng>
    middle, OutIter
    dest_first)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *middle* becomes the first element of the new range and *middle - 1* becomes the last element.

The assignments in the parallel *rotate_copy* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last].

Returns The *rotate* algorithm returns a *rotate_copy_result*<*hpx::traits::range_iterator_t<Rng>*, *OutIter*>. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

```
template<typename ExPolicy, typename Rng, typename OutIter>
```

```
parallel::util::detail::algorithm_result<ExPolicy, rotate_copy_result<hpx::traits::range_iterator_t<Rng>, OutIter>> rotate
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *new_first* becomes the first element of the new range and *new_first* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last].

Returns The *rotate_copy* algorithm returns a *hpx::future<rotate_copy_result<hpx::traits::range_iterator_t<Rng>, OutIter>>* if the execution policy is of type *par-*

allel_task_policy and returns *rotate_copy_result*< `hpx::traits::range_iterator_t<Rng>`, `OutIter`> otherwise. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

`hpx::ranges::search`, `hpx::ranges::search_n`

Defined in header `hpx/algorithms.hpp`⁶⁶².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename FwdIter, typename Sent, typename FwdIter2, typename Sent2, typename Pred =  
        hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
FwdIter search(FwdIter first, Sent last, FwdIter2 s_first, Sent2 s_last, Pred &&op = Pred(), Proj1  
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note: Complexity: at most (S^*N) comparisons where $S = \text{distance}(s_{\text{first}}, s_{\text{last}})$ and $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

⁶⁶² <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types `Type1` and `Type2` must be such that objects of types `FwdIter1` and `FwdIter2` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced `FwdIter1` as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced `FwdIter2` as a projection operation before the actual predicate is invoked.

Returns The `search` algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `task_execution_policy` and returns `FwdIter` otherwise. The `search` algorithm returns an iterator to the beginning of the first subsequence $[s_first, s_last)$ in range $[first, last]$. If the length of the subsequence $[s_first, s_last)$ is greater than the length of the range $[first, last)$, `last` is returned. Additionally if the size of the subsequence is empty `first` is returned. If no subsequence is found, `last` is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename FwdIter2, typename Sent2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type search(ExPolicy &&policy, FwdIter
first, Sent last, FwdIter2 s_first,
Sent2 s_last, Pred &&cop =
Pred(), Proj1 &&proj1 =
Proj1(), Proj2 &&proj2 =
Proj2())
```

Searches the range $[first, last)$ for any elements in the range $[s_first, s_last)$. Uses a provided predicate to compare elements.

The comparison operations in the parallel `search` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The comparison operations in the parallel `search` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it

- executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
 - **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.
 - **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
 - **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
 - **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
 - **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
 - **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last]. If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), last is returned. Additionally if the size of the subsequence is empty first is returned. If no subsequence is found, last is returned.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::traits::range_iterator_t<Rng1> search(Rng1 &&rng1, Rng2 &&rng2, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note: Complexity: at most $(S * N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence $[s_first, s_last]$ in range $[\text{first}, \text{last}]$. If the length of the subsequence $[s_first, s_last]$ is greater than the length of the range $[\text{first}, \text{last}]$, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred =
hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng1>> search(ExPolicy  
    &&policy,  
    Rng1  
    &&&rng1,  
    Rng2  
    &&&rng2,  
    Pred  
    &&&op  
    =  
    Pred(),  
    Proj1  
    &&&proj1  
    =  
    Proj1(),  
    Proj2  
    &&&proj2  
    =  
    Proj2())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most (S^*N) comparisons where $S = \text{distance}(s_{\text{first}}, s_{\text{last}})$ and $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated

as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types `Type1` and `Type2` must be such that objects of types `FwdIter1` and `FwdIter2` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of `rng1` as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of `rng2` as a projection operation before the actual predicate *is* invoked.

Returns The `search` algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `task_execution_policy` and returns `FwdIter` otherwise. The `search` algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last)` in range `[first, last]`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, `last` is returned. Additionally if the size of the subsequence is empty `first` is returned. If no subsequence is found, `last` is returned.

```
template<typename FwdIter, typename FwdIter2, typename Sent2, typename Pred =  
    hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
FwdIter search_n(FwdIter first, std::size_t count, FwdIter2 s_first, Sent s_last, Pred &op = Pred(),  
    Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Uses a provided predicate to compare elements.

The comparison operations in the parallel `search_n` algorithm execute in sequential order in the calling thread.

Note: Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{count}$.

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `adjacent_find` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced `FwdIter`.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced `FwdIter2`.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.

- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types `Type1` and `Type2` must be such that objects of types `FwdIter1` and `FwdIter2` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced `FwdIter1` as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced `FwdIter2` as a projection operation before the actual predicate *is* invoked.

Returns The `search_n` algorithm returns `FwdIter`. The `search_n` algorithm returns an iterator to the beginning of the last subsequence $[s_first, s_last]$ in range $[first, first+count]$. If the length of the subsequence $[s_first, s_last]$ is greater than the length of the range $[first, first+count]$, `first` is returned. Additionally, if the size of the subsequence is empty or no subsequence is found, `first` is also returned.

```
template<typename ExPolicy, typename FwdIter, typename FwdIter2, typename Sent2, typename  
Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type search_n(ExPolicy &&policy,  
FwdIter first,  
std::size_t count,  
FwdIter2 s_first, Sent2  
s_last, Pred &&op =  
Pred(), Proj1 &&proj1  
= Proj1(), Proj2  
&&proj2 = Proj2())
```

Searches the range $[first, last]$ for any elements in the range $[s_first, s_last]$. Uses a provided predicate to compare elements.

The comparison operations in the parallel `search_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The comparison operations in the parallel `search_n` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{count}$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns The *search_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search_n* algorithm returns an iterator to the beginning of the last subsequence [s_first, s_last] in range [first, first+count). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, first+count), *first* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::traits::range_iterator_t<Rng1> search_n(Rng1 &&rng1, std::size_t count, Rng2 &&rng2, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note: Complexity: at most ($S \cdot N$) comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$

tance(first, last).

Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence $[s_first, s_last)$ in range $[first, last]$. If the length of the subsequence $[s_first, s_last)$ is greater than the length of the range $[first, last)$, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng1>> search_n(ExPolicy
    &&policy,
    Rng1
    &&&rng1,
    std::size_t
    count,
    Rng2
    &&&rng2,
    Pred
    &&&op
    =
    Pred(),
    Proj1
    &&&proj1
    =
    Proj1(),
    Proj2
    &&&proj2
    =
    Proj2())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most (S^*N) comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.

- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types `Type1` and `Type2` must be such that objects of types `FwdIter1` and `FwdIter2` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of `rng1` as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of `rng2` as a projection operation before the actual predicate *is* invoked.

Returns The `search` algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `task_execution_policy` and returns `FwdIter` otherwise. The `search` algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last]` in range `[first, last]`. If the length of the subsequence `[s_first, s_last]` is greater than the length of the range `[first, last]`, `last` is returned. Additionally if the size of the subsequence is empty `first` is returned. If no subsequence is found, `last` is returned.

hpx::ranges::set_difference

Defined in header `hpx/algorithm.hpp`⁶⁶³.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **ranges**

⁶⁶³ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2,
typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename
Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_difference_result<Iter1, Iter3>>::type set_difference(ExPolicy
&&policy,
Iter1
first1,
Sent1
last1,
Iter2
first2,
Sent2
last2,
Iter3
dest,
Pred
&&op
=
Pred(),
Proj1
&&proj
=
Proj1(),
Proj2
&&proj
=
Proj2());
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range [*first1*, *last1*) and not present in the range [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), it will be copied to *dest* exactly std::max(*m-n*, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2^*(N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_difference* algorithm returns a `hpx::future<ranges::set_difference_result<Iter1, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_difference_result<Iter1, Iter3>` otherwise. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

`hpx::parallel::util::detail::algorithm_result<ExPolicy, set_difference_result<hpx::traits::range_iterator_t<Rng1>, Iter3>> set_difference(hpx::parallel::util::detail::algorithm_result<ExPolicy, set_difference_result<hpx::traits::range_iterator_t<Rng1>, Iter3>> dest, hpx::parallel::util::detail::algorithm_result<ExPolicy, set_difference_result<hpx::traits::range_iterator_t<Rng2>, Iter3>> first1, hpx::parallel::util::detail::algorithm_result<ExPolicy, set_difference_result<hpx::traits::range_iterator_t<Rng2>, Iter3>> first2)`

Constructs a sorted range beginning at `dest` consisting of all elements present in the range `[first1, last1]` and not present in the range `[first2, last2]`. This algorithm expects both input ranges to be sorted with the given binary predicate `f`.

Equivalent elements are treated individually, that is, if some element is found m times in `[first1, last1]` and n times in `[first2, last2]`, it will be copied to `dest` exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_difference* algorithm returns a *hpx::future<ranges::set_difference_result<Iter1, Iter3>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_difference_result<Iter1, Iter3>* otherwise. where Iter1 is *range_iterator_t<Rng1>* and Iter2 is *range_iterator_t<Rng2>* The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,
typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =
hpx::identity>
set_difference_result<Iter1, Iter3> set_difference(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2,
Iter3 dest, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range [first1, last1) and not present in the range [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::max(m-n, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_difference* algorithm returns *ranges::set_difference_result<Iter1, Iter3>*. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_difference_result<hpx::traits::range_iterator_t<Rng1>, Iter3> set_difference(Rng1 &&rng1,
Rng2 &&rng2,
Iter3 dest, Pred
&&op = Pred(),
Proj1 &&proj1 =
Proj1(), Proj2
&&proj2 =
Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range [first1, last1) and not present in the range [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::max(m-n, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2^*(N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_difference* algorithm returns *ranges::set_difference_result<Iter1, Iter3>*. where *Iter1* is *range_iterator_t<Rng1>* and *Iter2* is *range_iterator_t<Rng2>* The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::set_intersection

Defined in header `hpx/algorithms.hpp`⁶⁶⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2,
         typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename
         Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_intersection_result<Iter1, Iter2, Iter3>>::type set_intersection
```

Constructs a sorted range beginning at `dest` consisting of all elements present in both sorted ranges `[first1, last1]` and `[first2, last2]`. This algorithm expects both input ranges to be sorted with the given binary predicate `f`.

If some element is found m times in `[first1, last1]` and n times in `[first2, last2]`, the first `std::min(m, n)` elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

⁶⁶⁴ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_intersection* algorithm returns a *hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_intersection_result<Iter1, Iter2, Iter3>* otherwise. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_intersection_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>> > set_intersection(
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [*first1*, *last1*] and [*first2*, *last2*]. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*] and *n* times in [*first2*, *last2*], the first *std::min(m, n)* elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_intersection` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

Returns The `set_intersection` algorithm returns a `hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>` otherwise. where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>` The `set_intersection` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,
typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =
hpx::identity>
set_intersection_result<Iter1, Iter2, Iter3> set_intersection(Iter1 first1, Sent1 last1, Iter2 first2,
                                                               Sent2 last2, Iter3 dest, Pred &&op =
                                                               Pred(), Proj1 &&proj1 = Proj1(), Proj2
                                                               &&proj2 = Proj2())
```

Constructs a sorted range beginning at `dest` consisting of all elements present in both sorted ranges `[first1, last1]` and `[first2, last2]`. This algorithm expects both input ranges to be sorted with the given binary predicate `f`.

If some element is found m times in [first1, last1) and n times in [first2, last2), the first std::min(m, n) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_intersection* algorithm returns *ranges::set_intersection_result<Iter1, Iter2, Iter3>*. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_intersection_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, Iter3> set_intersection(Rng1 &first1, Rng2 &first2, Iter3 &dest, Pred op = hpx::parallel::detail::less{}, Proj1 proj1 = hpx::identity{}, Proj2 proj2 = hpx::identity{})
```

Constructs a sorted range beginning at `dest` consisting of all elements present in both sorted ranges $[first1, last1]$ and $[first2, last2]$. This algorithm expects both input ranges to be sorted with the given binary predicate f .

If some element is found m times in $[first1, last1]$ and n times in $[first2, last2]$, the first $\text{std}::\text{min}(m, n)$ elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_intersection` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal.

The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

Returns The `set_intersection` algorithm returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>`. where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>` The `set_intersection` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::set_symmetric_difference

Defined in header `hpx/algorithm.hpp`⁶⁶⁵.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2,
        typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename
        Proj2 = hpx::identity

```

⁶⁶⁵ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorith.hpp>

`hpx::parallel::util::detail::algorithm_result<ExPolicy, set_symmetric_difference_result<Iter1, Iter2, Iter3>>::type` **set_symmetric_difference**

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges [*first1*, *last1*) and [*first2*, *last2*), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), it will be copied to *dest* exactly `std::abs(m-n)` times. If *m*>*n*, then the last *m-n* of those elements are copied from [*first1*,*last1*), otherwise the last *n-m* elements are copied from [*first2*,*last2*). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_symmetric_difference* algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

`hpx::parallel::util::detail::algorithm_result<ExPolicy, set_symmetric_difference_result<hpx::traits::range_iterator_t<Rng1>`

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges [*first1*, *last1*] and [*first2*, *last2*], but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*] and *n* times in [*first2*, *last2*], it will be copied to *dest* exactly `std::abs(m-n)` times. If *m*>*n*, then the last *m-n* of those elements are copied from [*first1*,*last1*), otherwise the last *n-m* elements are copied from [*first2*,*last2*). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_symmetric_difference* algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,
typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =
hpx::identity>
set_symmetric_difference_result<Iter1, Iter2, Iter3> set_symmetric_difference(Iter1 first1, Sent1
last1, Iter2 first2,
Sent2 last2, Iter3
dest, Pred &&op =
Pred(), Proj1
&&proj1 = Proj1(),
Proj2 &&proj2 =
Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges [*first1*, *last1*] and [*first2*, *last2*], but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*] and *n* times in [*first2*, *last2*], it will be copied to *dest*

exactly `std::abs(m-n)` times. If $m > n$, then the last $m-n$ of those elements are copied from `[first1, last1]`, otherwise the last $n-m$ elements are copied from `[first2, last2]`. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for **Iter1**.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for **Iter2**.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_symmetric_difference` requires **Pred** to meet the requirements of `CopyConstructible`. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The `set_symmetric_difference` algorithm returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>`. The `set_symmetric_difference` algorithm returns the output iterator to the element in the

destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_symmetric_difference_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, Iter3> set_symmetric_difference(Rng1 first1, Rng1 last1, Rng2 first2, Rng2 last2, Pred pred, Proj1 proj1, Proj2 proj2, Iter3 dest);
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges [*first1*, *last1*] and [*first2*, *last2*], but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*] and *n* times in [*first2*, *last2*], it will be copied to *dest* exactly std::abs(*m-n*) times. If *m>n*, then the last *m-n* of those elements are copied from [*first1*,*last1*), otherwise the last *n-m* elements are copied from [*first2*,*last2*). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.

- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

Returns The `set_symmetric_difference` algorithm returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>`. where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>`. The `set_symmetric_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::set_union

Defined in header `hpx/algorithm.hpp`⁶⁶⁶.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

⁶⁶⁶ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2,
typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename
Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_union_result<Iter1, Iter2, Iter3>>::type set_union(ExPolicy
&&policy,
Iter1
first1,
Sent1
last1,
Iter2
first2,
Sent2
last2,
Iter3
dest,
Pred
&&cop
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate f.

If some element is found m times in [first1, last1) and n times in [first2, last2), then all m elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2^*(N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_union* algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = `hpx::parallel::detail::less`, typename **Proj1** = `hpx::identity`, typename **Proj2** = `hpx::identity`>

`hpx::parallel::util::detail::algorithm_result<ExPolicy, set_union_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, Rng3> >`

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate f.

If some element is found m times in [first1, last1) and n times in [first2, last2), then all m elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_union* algorithm returns a *hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_union_result<Iter1, Iter2, Iter3>* otherwise. where Iter1 is *range_iterator_t<Rng1>* and Iter2 is *range_iterator_t<Rng2>* The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,
typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =
hpx::identity>
set_union_result<Iter1, Iter2, Iter3> tagFallbackInvoke(set_union_t, Iter1 first1, Sent1 last1, Iter2
first2, Sent2 last2, Iter3 dest, Pred &&op
= Pred(), Proj1 &&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), then all *m* elements will be copied from [first1, last1) to *dest*, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns The *set_union* algorithm returns `ranges::set_union_result<Iter1, Iter2, Iter3>`. The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = `hpx::parallel::detail::less`,
typename **Proj1** = `hpx::identity`, typename **Proj2** = `hpx::identity`>

```
set_union_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, Iter3> set_union(Rng1
&&rng1,
Rng2
&&rng2,
Iter3
dest,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), then all *m* elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2*(N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal.
The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

Returns The `set_union` algorithm returns `ranges::set_union_result<Iter1, Iter2, Iter3>`. where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>` The `set_union` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::shift_left

Defined in header `hpx/algorithm.hpp`⁶⁶⁷.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename FwdIter, typename Sent, typename Size>
FwdIter shift_left(FwdIter first, Sent last, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position `first + n + i` to position `first + i`.

The assignment operations in the parallel `shift_left` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced `FwdIter` must meet the requirements of `MoveAssignable`.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.

⁶⁶⁷ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorith.hpp>

- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns The *shift_left* algorithm returns *FwdIter*. The *shift_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> shift_left(ExPolicy &&policy,
                                                               FwdIter first, Sent last,
                                                               Size n)
```

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns The *shift_left* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename Rng, typename Size>
hpx::traits::range_iterator_t<Rng> shift_left(Rng &&rng, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every

integer i in $[0, \text{last} - \text{first}]$

- n), moves the element originally at position $\text{first} + n + i$ to position $\text{first} + i$.

The assignment operations in the parallel *shift_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most $(\text{last} - \text{first}) - n$ assignments.

Note: The type of dereferenced *hpx::traits::range_iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns The *shift_left* algorithm returns *hpx::traits::range_iterator_t<Rng>*. The *shift_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename Rng, typename Size>
parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng>> shift_left(ExPolicy
    &&policy,
    Rng
    &&rng,
    Size
    n)
```

Shifts the elements in the range $[\text{first}, \text{last})$ by n positions towards the beginning of the range. For every integer i in $[0, \text{last} - \text{first}]$

- n), moves the element originally at position $\text{first} + n + i$ to position $\text{first} + i$.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $(\text{last} - \text{first}) - n$ assignments.

Note: The type of dereferenced *hpx::traits::range_iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns The *shift_left* algorithm returns a *hpx::future<hpx::traits::range_iterator_t<Rng>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *hpx::traits::range_iterator_t<Rng>* otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range.

hpx::ranges::shift_right

Defined in header [hpx/algorithm.hpp](#)⁶⁶⁸.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename FwdIter, typename Sent, typename Size>
FwdIter shift_right(FwdIter first, Sent last, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

⁶⁶⁸ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorith.hpp>

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns The *shift_right* algorithm returns *FwdIter*. The *shift_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> shift_right(ExPolicy &&policy,
                                                               FwdIter first, Sent last,
                                                               Size n)
```

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- $n + i$.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns The *shift_right* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename Rng, typename Size>
hpx::traits::range_iterator_t<Rng> shift_right(Rng &&rng, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- $n + i$.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *hpx::traits::range_iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns The *shift_right* algorithm returns *hpx::traits::range_iterator_t<Rng>*. The *shift_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename Rng, typename Size>
parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng>> shift_right(ExPolicy
    &&policy,
    Rng
    &&rng,
    Size
    n)
```

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *hpx::traits::range_iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns The *shift_right* algorithm returns a *hpx::future<hpx::traits::range_iterator_t<Rng>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *hpx::traits::range_iterator_t<Rng>* otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

hpx::ranges::sort

Defined in header [hpx/algorithms.hpp](#)⁶⁶⁹.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj =
hpx::identity>
RandomIt sort(RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i + n* is a valid iterator pointing to an element of the sequence, and *INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false*.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: O(N log(N)), where N = *detail::distance(first, last)* comparisons.

Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *RandomIt*.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

⁶⁶⁹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less,
          typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type sort(ExPolicy &&policy, RandomIt
    first, Sent last, Comp &&comp
    = Comp(), Proj &&proj =
    Proj())
```

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i + n* is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: O(N log(N)), where N = detail::distance(first, last) comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp, typename Proj>
hpx::traits::range_iterator_t<Rng> sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i + n* is a valid iterator pointing to an element of the sequence, and *(INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false)*.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: $O(N \log(N))$, where $N = \text{std}::\text{distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$ comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *sort* algorithm returns *hpx::traits::range_iterator_t<Rng>*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng>> sort(ExPolicy
    &&policy,
    Rng &&rng,
    Comp
    &&comp =
    Comp(), Proj
    &&proj =
    Proj())
```

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i + n* is a valid iterator pointing to an element of the sequence, and $\text{(INVOKE}(\text{comp}, \text{INVOKED}(\text{proj}, *(\text{i} + \text{n})), \text{INVOKED}(\text{proj}, *\text{i})) == \text{false}$.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(N \log(N))$, where $N = \text{std}::\text{distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the *INVOKED* operation applied to an object of type *Comp*, when contextually converted to *bool*, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *sort* algorithm returns a *hpx::future<hpx::traits::range_iterator_t<Rng>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *hpx::traits::range_iterator_t<Rng>* otherwise. It returns *last*.

hpx::ranges::stable_sort

Defined in header `hpx/algorithms.hpp`⁶⁷⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj =
hpx::identity>
RandomIt stable_sort(RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *stable_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: $O(N \log(N))$, where $N = \text{std}:\text{distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

⁶⁷⁰ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

Returns The *stable_sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less,
         typename Proj = hpx::identity>
parallel::util::algorithm_result<ExPolicy, RandomIt>::type stable_sort(ExPolicy &&policy,
                                                                     RandomIt first, Sent
                                                                     last, Comp &&comp =
                                                                     Comp(), Proj &&proj
                                                                     = Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object *comp* (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and *Invoke*(*comp*, *Invoke*(*proj*, *(*i* + *n*)), *Invoke*(*proj*, **i*)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(N \log(N))$, where $N = \text{std}::\text{distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *RandomIt*.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – *comp* is a callable object. The return value of the *Invoke* operation applied to an object of type *Comp*, when contextually converted to *bool*, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *stable_sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandomIt* otherwise.

The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
hpx::traits::range_iterator_t<Rng> stable_sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj
= Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object *comp* (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(*comp*, INVOKE(*proj*, *(*i* + *n*)), INVOKE(*proj*, **i*)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *stable_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *stable_sort* algorithm returns *hpx::traits::range_iterator_t<Rng>*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj =
hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, hpx::traits::range_iterator_t<Rng>> stable_sort(ExPolicy
&&pol-
icy,
Rng
&&rng,
Comp
&&comp
=
Comp(),
Proj
&&proj
=
Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object *comp* (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and *INVOKED*(*comp*, *INVOKED*(*proj*, *(*i* + *n*)), *INVOKED*(*proj*, **i*)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(N \log(N))$, where $N = \text{std}::\text{distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the *INVOKED* operation applied to an object of type *Comp*, when contextually converted to *bool*, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns The *stable_sort* algorithm returns a *hpx::future<hpx::traits::range_iterator_t<Rng>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *hpx::traits::range_iterator_t<Rng>* otherwise. It returns *last*.

hpx::ranges::starts_with

Defined in header *hpx/algorithm.hpp*⁶⁷¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

⁶⁷¹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorith.mpp>

Functions

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool starts_with(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a input iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx*::*identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx*::*identity*

Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

Returns The *starts_with* algorithm returns *bool*. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> starts_with(ExPolicy &&policy,
FwdIter1 first1, Sent1
last1, FwdIter2 first2,
Sent2 last2, Pred &&pred
= Pred(), Proj1 &&proj1 =
Proj1(), Proj2 &&proj2 =
Proj2())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns The *starts_with* algorithm returns a *hpx::future<bool>* if the execution policy is

of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename Proj1 =
    hpx::identity, typename Proj2 = hpx::identity>
bool starts_with(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(),
    Proj2 &&proj2 = Proj2())
```

Checks whether the second range *rng2* matches the prefix of the first range *rng1*.

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

Returns The *starts_with* algorithm returns *bool*. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = ranges::equal_to,
    typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, bool>::type starts_with(ExPolicy &&policy,
    Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(),
    Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range *rng2* matches the prefix of the first range *rng1*.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear: at most $\min(N_1, N_2)$ applications of the predicate and both projections.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns The *starts_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

hpx::ranges::swap_ranges

Defined in header [hpx/algorithms.hpp](#)⁶⁷².

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **ranges**

⁶⁷² <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

Functions

```
template<typename InIter1, typename Sent1, typename InIter2, typename Sent2>
swap_ranges_result<InIter1, InIter2> swap_ranges(InIter1 first1, Sent1 last1, InIter2 first2, Sent2 last2)
    Exchanges elements between range [first1, last1) and another range starting at first2.
```

The swap operations in the parallel *swap_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **InIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for InIter1.
- **InIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

Returns The *swap_ranges* algorithm returns *swap_ranges_result*<*InIter1*, *InIter2*>. The *swap_ranges* algorithm returns *in_in_result* with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<FwdIter1, FwdIter2>>::type swap_ranges(ExPolicy
    &&policy,
    FwdIter1
    first1,
    Sent1
    last1,
    FwdIter2
    first2,
    Sent2
    last2)
```

Exchanges elements between range [first1, last1) and another range starting at first2.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in

unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for FwdIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

Returns The *swap_ranges* algorithm returns a *hpx::future<swap_ranges_result<FwdIter1, FwdIter2>>* if the execution policy is of type *parallel_task_policy* and returns *FwdIter2* otherwise. The *swap_ranges* algorithm returns *in_in_result* with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename Rng1, typename Rng2>
swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>> swap_ranges(Rng1
&&rng1,
Rng2
&&rng2)
```

Exchanges elements between range [*first1*, *last1*] and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns The *swap_ranges* algorithm returns *swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>*. The

swap_ranges algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**>

`parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>>>`

Exchanges elements between range `[first1, last1)` and another range starting at `first2`.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between `first1` and `last1`

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns The *swap_ranges* algorithm returns a `hpx::future<swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>>` if the execution policy is of type *parallel_task_policy* and returns `swap_ranges_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng1>>`. otherwise. The *swap_ranges* algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

hpx::ranges::transform

Defined in header `hpx/algorithms.hpp`⁶⁷³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename F, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, ranges::unary_transform_result<FwdIter1, FwdIter2>>::type transform(
```

Applies the given function f to the given range rng and stores the result in another range, beginning at $dest$.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly $\text{size}(rng)$ applications of f

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of f .
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for **FwdIter1**.

⁶⁷³ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns a *hpx::future<ranges::unary_transform_result<FwdIter1, FwdIter2>>* if the execution policy is of type *parallel_task_policy* and returns *ranges::unary_transform_result<FwdIter1, FwdIter2>* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename F, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, ranges::unary_transform_result<hpx::traits::range_iterator_t<Rng>, FwdIter>
```

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at *dest*.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified

threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly `size(rng)` applications of `f`

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of `f`.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires `F` to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last]. This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type `Type` must be such that an object of type `range_iterator<Rng>::type` can be dereferenced and then implicitly converted to `Type`. The type `Ret` must be such that an object of type `OutIter` can be dereferenced and assigned a value of type `Ret`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate `f` is invoked.

Returns The *transform* algorithm returns a `hpx::future<ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>>` if the execution policy is of type `parallel_task_policy` and returns `ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>` otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename FwdIter3, typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

`parallel::util::detail::algorithm_result<ExPolicy, ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>::type t`

Applies the given function f to pairs of elements from two ranges: one defined by rng and the other beginning at $first2$, and stores the result in another range, beginning at $dest$.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly $\text{size}(rng)$ applications of f

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of f .
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for $FwdIter1$.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for $FwdIter2$.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires F to meet the requirements of *CopyConstructible*.

- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns A *hpx::future<ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>* if the execution policy is of type *parallel_task_policy* and returns *ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename FwdIter, typename F,  
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

`parallel::util::detail::algorithm_result<ExPolicy, ranges::binary_transform_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, F, Proj1, Proj2>`

Applies the given function f to pairs of elements from two ranges: one defined by [first1, last1) and the other beginning at first2, and stores the result in another range, beginning at dest.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly $\min(\text{last2}-\text{first2}, \text{last1}-\text{first1})$ applications of f

Note: The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of f .
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires F to meet the requirements of *CopyConstructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types `Type1` and `Type2` must be such that objects of types `range_iterator<Rng1>::type` and `range_iterator<Rng2>::type` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively. The type `Ret` must be such that an object of type `FwdIter` can be dereferenced and assigned a value of type `Ret`.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `f` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `f` is invoked.

Returns The `transform` algorithm returns a `hpx::future<ranges::binary_transform_result< hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, FwdIter> >` if the execution policy is of type `parallel_task_policy` and returns `ranges::binary_transform_result< hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, FwdIter>` otherwise. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename F, typename Proj = hpx::identity
ranges::unary_transform_result<FwdIter1, FwdIter2> transform(FwdIter1 first, Sent1 last, FwdIter2 dest, F &&f, Proj &&proj = Proj())
```

Applies the given function `f` to the given range `rng` and stores the result in another range, beginning at `dest`.

Note: Complexity: Exactly `size(rng)` applications of `f`

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for `FwdIter1`.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires `F` to meet the requirements of `CopyConstructible`.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `Ret` must be such that an object of type `FwdIter2` can be dereferenced and assigned a value of type `Ret`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate `f` is invoked.

Returns The `transform` algorithm returns `ranges::unary_transform_result<FwdIter1, FwdIter2>`. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter, typename F, typename Proj = hpx::identity>
ranges::unary_transform_result<hpx::traits::range_iterator_t<Rng>, FwdIter> transform(Rng &&rng,
FwdIter dest,
F &&f, Proj
&&proj =
Proj())
```

Applies the given function `f` to the given range `rng` and stores the result in another range, beginning at `dest`.

Note: Complexity: Exactly `size(rng)` applications of `f`

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `transform` requires `F` to meet the requirements of `CopyConstructible`.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type `Type` must be such that an object of type `range_iterator<Rng>::type` can be dereferenced and then implicitly converted to `Type`. The type `Ret` must be such that an object of type `OutIter` can be dereferenced and assigned a value of type `Ret`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns *ranges*::*unary_transform_result*<*range_iterator*<*Rng*>::*type*, *FwdIter*>. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename FwdIter3, typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3> transform(FwdIter1 first1, Sent1 last1, FwdIter2 first2, Sent2 last2, FwdIter3 dest, F &&f, Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Applies the given function *f* to pairs of elements from two ranges: one defined by *rng* and the other beginning at *first2*, and stores the result in another range, beginning at *dest*.

Note: Complexity: Exactly size(*rng*) applications of *f*

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *FwdIter1*.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *FwdIter2*.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last]. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types `Type1` and `Type2` must be such that objects of types `FwdIter1` and `FwdIter2` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively. The type `Ret` must be such that an object of type `FwdIter3` can be dereferenced and assigned a value of type `Ret`.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate f is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate f is invoked.

Returns The `transform` algorithm returns `ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>`. The `transform` algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename FwdIter, typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
ranges::binary_transform_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, FwdIter> transform
```

Applies the given function f to pairs of elements from two ranges: one defined by $[first1, last1)$ and the other beginning at $first2$, and stores the result in another range, beginning at $dest$.

Note: Complexity: Exactly $\min(last2-first2, last1-first1)$ applications of f

Note: The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types *Type1* and *Type2* must be such that objects of types `range_iterator<Rng1>::type` and `range_iterator<Rng2>::type` can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns The *transform* algorithm returns `ranges::binary_transform_result<hpx::traits::range_iterator_t<Rng1>, hpx::traits::range_iterator_t<Rng2>, FwdIter>`. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

hpx::ranges::transform_exclusive_scan

Defined in header `hpx/algorithm.hpp`⁶⁷⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

⁶⁷⁴ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp,
typename T = typename std::iterator_traits<InIter>::value_type>
transform_exclusive_scan_result<InIter, OutIter> transform_exclusive_scan(InIter first, Sent last,
OutIter dest, T init,
BinOp &&binary_op,
UnOp &&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform_exclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, a1, ..., aN) is defined as:

- a1 when N is 1
- *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, aM, ..., aN)) where $1 < K+1 = M \leq N$.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

Returns The `transform_exclusive_scan` algorithm returns `transform_exclusive_scan_result<InIter, OutIter>`. The `transform_exclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_exclusive_result<FwdIter1, FwdIter2>>::type transform_excl
```

Assigns through each iterator i in $[\text{result}, \text{result} + (\text{last} - \text{first})]$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(`binary_op`, `init`, `conv(*first), \dots, conv(*(\text{first} + (i - \text{result}) - 1))`).

The reduce operations in the parallel `transform_exclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_exclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges $[\text{first}, \text{last}]$ or $[\text{result}, \text{result} + (\text{last} - \text{first})]$.

The behavior of `transform_exclusive_scan` may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates `op` and `conv`.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
 - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

Returns The `transform_exclusive_scan` algorithm returns a `hpx::future<transform_exclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_exclusive_result<FwdIter1, FwdIter2>` otherwise. The `transform_exclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<hpx::traits::range_iterator_t<Rng>>::value_type>
```

```
transform_exclusive_scan_result<hpx::traits::range_iterator_t<Rng>, O> transform_exclusive_scan(Rng
    &&rng,
    O
    dest,
    T
    init,
    BinOp
    &&bi-
    nary_op,
    UnOp
    &&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform_exclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: O(*last - first*) applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, a1, ..., aN) is defined as:

- a1 when N is 1
 - op(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, aM, ..., aN)) where 1 < K+1 = M <= N.
-

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_exclusive_scan* algorithm returns a *transform_exclusive_scan_result< traits::range_iterator_t<Rng>, O>*. The *transform_exclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<hpx::traits::range_iterator_t<Rng>>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_exclusive_scan_result<hpx::traits::range_iterator_t<Rng>, O>>
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first, last) or [result, result + (last - first)).

The behavior of *transform_exclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1

- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

Returns The `transform_exclusive_scan` algorithm returns a `hpx::future<transform_exclusive_scan_result< traits::range_iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_exclusive_scan_result< traits::range_iterator_t<Rng>, O>` otherwise. The `transform_exclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

`hpx::ranges::transform_inclusive_scan`

Defined in header `hpx/algorithms.hpp`⁶⁷⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp>
transform_inclusive_scan_result<InIter, OutIter> transform_inclusive_scan(InIter first, Sent last,
                                                                     OutIter dest, BinOp
                                                                     &&binary_op, UnOp
                                                                     &&unary_op)
```

Assigns through each iterator i in $[result, result + (last - first))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM($op, conv(*first), \dots, conv(*(\text{first} + (i - result)))$)).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first, last) or [result, result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a_1, \dots, a_N) is defined as:

- a_1 when N is 1
- $op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a_1, \dots, a_K), GENERALIZED_NONCOMMUTATIVE_SUM(op, a_{K+1}, \dots, a_N))$ where $1 < K+1 = M \leq N$.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

⁶⁷⁵ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

Returns The `transform_inclusive_scan` algorithm returns `transform_inclusive_scan_result<InIter, OutIter>`. The `transform_inclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename  
BinOp, typename UnOp>  
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>::type transform_incl
```

Assigns through each iterator i in $[result, result + (last - first))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM($op, conv(*first), \dots, conv(*(\text{first} + (i - result)))$).

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *op* and *conv*.

Note: *GENERALIZED_NONCOMMUTATIVE_SUM*(*op*, *a*1, ..., *a*N) is defined as:

- *a*1 when N is 1
 - *op*(*GENERALIZED_NONCOMMUTATIVE_SUM*(*op*, *a*1, ..., *a*K), *GENERALIZED_NONCOMMUTATIVE_SUM*(*op*, *a*M, ..., *a*N)) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_inclusive_scan* algorithm returns a *hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>>* if the execution

policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_result*<*FwdIter1*, *FwdIter2*> otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp>
transform_inclusive_scan_result<hpx::traits::range_iterator_t<Rng>, O> transform_inclusive_scan(Rng
&&rng,
O
dest,
BinOp
&&bi-
nary_op,
UnOp
&&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_N) is defined as:

- *a*₁ when N is 1
 - *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_K), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*_M, ..., *a*_N) where $1 < K+1 = M \leq N$)
-

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

Ret fun (const Type1 & <i>a</i> , const Type1 & <i>b</i>);

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by

the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

Returns The `transform_inclusive_scan` algorithm returns a `transform_inclusive_scan_result< traits::range_iterator_t<Rng>, O>`. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_scan_result<hpx::traits::range_iterator_t<Rng>, O>>;
```

Assigns through each iterator i in $[result, result + (last - first))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM($op, conv(*first), \dots, conv(*(\text{first} + (i - result)))$)).

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges $[first, last)$ or $[result, result + (last - first))$.

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of the predicates `op` and `conv`.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a_1, \dots, a_N) is defined as:

- a_1 when N is 1
- $op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a_1, \dots, a_K), GENERALIZED_NONCOMMUTATIVE_SUM(op, a_{K+1}, \dots, a_N))$ where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

Returns The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_scan_result< traits::range_iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_scan_result< traits::range_iterator_t<Rng>, O>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp,
typename T = typename std::iterator_traits<InIter>::value_type>
transform_inclusive_scan_result<InIter, OutIter> transform_inclusive_scan(InIter first, Sent last,
                                         OutIter dest, BinOp
                                         &&binary_op, UnOp
                                         &&unary_op, T init)
```

Assigns through each iterator i in $[result, result + (last - first))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result)))).

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked without an execution

policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, a1, ..., aN) is defined as:

- a1 when N is 1
 - *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, aM, ..., aN)) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns The *transform_inclusive_scan* algorithm returns *transform_inclusive_scan_result*<*InIter*, *OutIter*>. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>::type transform_incl
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_N) is defined as:

- *a*₁ when N is 1
- *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_K), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*_M, ..., *a*_N) where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

- **init** – The initial value for the generalized sum.

Returns The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_result<FwdIter1, FwdIter2>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<hpx::traits::range_iterator_t<Rng>>::value_type>
transform_inclusive_scan_result<hpx::traits::range_iterator_t<Rng>, O> transform_inclusive_scan(Rng
&&rng,
O
dest,
BinOp
&&bi-
nary_op,
UnOp
&&unary_op,
T
init)
```

Assigns through each iterator i in $[result, result + (last - first))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first, last) or [result, result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*1, ..., *a*N) is defined as:

- *a*1 when N is 1
- *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*1, ... , *a*K), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*M, ..., *a*N) where $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns The *transform_inclusive_scan* algorithm returns a *transform_inclusive_scan_result<* traits::range_iterator_t<*Rng*>, *O**>*. The *trans-*

form_inclusive_scan algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename std::iterator_traits<hpx::traits::range_iterator_t<Rng>>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_scan_result<hpx::traits::range_iterator_t<Rng>, O>>;
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result))))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first, last) or [result, result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_N) is defined as:

- *a*₁ when N is 1
 - *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_K), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*_M, ..., *a*_N) where $1 < K+1 = M \leq N$.)
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.

- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns The *transform_inclusive_scan* algorithm returns a *hpx::future<transform_inclusive_scan_result< traits::range_iterator_t<Rng>, O>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_scan_result< traits::range_iterator_t<Rng>, O>* otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::transform_reduce

Defined in header [hpx/algorithm.hpp](#)⁶⁷⁶.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

⁶⁷⁶ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename ExPolicy, typename Iter, typename Sent, typename T, typename Reduce, typename Convert>
    hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Iter
        first, Sent last, T init, Reduce
        &&red_op, Convert
        &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(*last - first*) applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(*op*, *a*₁, ..., *a*_N) is defined as follows:

- *a*₁ when N is 1
 - *op*(GENERALIZED_SUM(*op*, *b*₁, ..., *b*_K), GENERALIZED_SUM(*op*, *b*_M, ..., *b*_N)), where:
 - *b*₁, ..., *b*_N may be any permutation of *a*₁, ..., *a*_N and
 - 1 < K+1 = M <= N.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename T, typename Reduce, typename Convert>
T transform_reduce(Iter first, Sent last, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(*op*, *a*₁, ..., *a*_N) is defined as follows:

- *a*₁ when N is 1
- *op*(GENERALIZED_SUM(*op*, *b*₁, ..., *b*_K), GENERALIZED_SUM(*op*, *b*_M, ..., *b*_N)), where:
 - *b*₁, ..., *b*_N may be any permutation of *a*₁, ..., *a*_N and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.

- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Iter
first, Sent last, Iter2 first2, T
init)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(*op*, *a*₁, ..., *a*_N) is defined as follows:

- *a*₁ when *N* is 1
 - *op*(GENERALIZED_SUM(*op*, *b*₁, ..., *b*_K), GENERALIZED_SUM(*op*, *b*_M, ..., *b*_N)), where:
 - *b*₁, ..., *b*_N may be any permutation of *a*₁, ..., *a*_N and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last].

template<typename **Iter**, typename **Sent**, typename **Iter2**, typename **T**>
T transform_reduce(*Iter* first, *Sent* last, *Iter2* first2, *T* init)

Returns GENERALIZED_SUM(*red_op*, *init*, *conv_op*(*first), ..., *conv_op*(*first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last].

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T, typename Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Iter
first, Sent last, Iter2 first2, T
init, Reduce &&red_op,
Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(last - first)$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `Iter` can be dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

Returns The `transform_reduce` algorithm returns a `hpx::future<T>` if the execution policy is of type `parallel_task_policy` and returns `T` otherwise. The `transform_reduce` algorithm returns the result of the generalized sum over the values returned from `conv_op` when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename Iter2, typename T, typename Reduce, typename Convert>
T transform_reduce(Iter first, Sent last, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
    Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).
```

The difference between `transform_reduce` and `accumulate` is that the behavior of `transform_reduce` may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(last - first)$ applications of the predicates `red_op` and `conv_op`.

Note: `GENERALIZED_SUM(op, a1, ..., aN)` is defined as follows:

- a_1 when N is 1
- $op(GENERALIZED_SUM(op, b_1, \dots, b_K), GENERALIZED_SUM(op, b_M, \dots, b_N))$, where:
 - b_1, \dots, b_N may be any permutation of a_1, \dots, a_N and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `Iter`.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.

- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename T, typename Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Rng
&&rng, T init, Reduce
&&red_op, Convert
&&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: O(*last - first*) applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:

-
- b_1, \dots, b_N may be any permutation of a_1, \dots, a_N and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename Rng, typename T, typename Reduce, typename Convert>
T transform_reduce(Rng &&rng, T init, Reduce &&red_op, Convert &&conv_op)
    Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).
```

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note: *GENERALIZED_SUM*(*op*, *a*₁, ..., *a*_N) is defined as follows:

- *a*₁ when *N* is 1
 - *op*(*GENERALIZED_SUM*(*op*, *b*₁, ..., *b*_K), *GENERALIZED_SUM*(*op*, *b*_M, ..., *b*_N)), where:
 - *b*₁, ..., *b*_N may be any permutation of *a*₁, ..., *a*_N and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename Iter2, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Rng
&&rng, Iter2 first2, T init)
```

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(last - first)$ applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename Rng, typename Iter2, typename T>
T transform_reduce(Rng &&rng, Iter2 first2, T init)
```

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

Note: Complexity: $O(last - first)$ applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns The *transform_reduce* algorithm returns *T*.

```
template<typename ExPolicy, typename Rng, typename Iter2, typename T, typename Reduce, typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Rng
&&rng, Iter2 first2, T init,
Reduce &&red_op, Convert
&&conv_op)
```

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(last - first)$ applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns The `transform_reduce` algorithm returns a `hpx::future<T>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns *T* otherwise.

template<typename **Rng**, typename **Iter2**, typename **T**, typename **Reduce**, typename **Convert**>
T **transform_reduce**(**Rng** &&*rng*, **Iter2** *first2*, **T** *init*, **Reduce** &&*red_op*, **Convert** &&*conv_op*)

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

Note: Complexity: $O(last - first)$ applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have **const&**, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns The *transform_reduce* algorithm returns *T*.

hpx::ranges::uninitialized_copy, hpx::ranges::uninitialized_copy_n

Defined in header [hpx/algorithms.hpp](#)⁶⁷⁷.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename InIter, typename Sent1, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_copy(InIter first1, Sent1 last1,
                                                               FwdIter first2, Sent2 last2)
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.

⁶⁷⁷ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_copy* algorithm returns an *in_out_result<InIter, FwdIter>*. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type uninitialized
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_copy* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result<InIter, FwdIter>* otherwise. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2>
```

```
hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

Returns The *uninitialized_copy* algorithm returns an *in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>*. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>>
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

Returns The *uninitialized_copy* algorithm returns a *hpx::future<in_out_result<InIter, FwdIter>>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result< typename hpx::traits::range_traits<Rng1>::iterator_type , typename hpx::traits::range_traits<Rng2>::iterator_type >* otherwise. The *uninitialized_copy* algorithm returns the input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename Size, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_copy_n(InIter first1, Size count,
                                                               FwdIter first2, Sent2 last2)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be copied from

- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_copy_n* algorithm returns *in_out_result<InIter, FwdIter>*. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type uninitialized
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.

- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_copy_n* algorithm returns a *hpx::future<in_out_result<FwdIter1, FwdIter2>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::uninitialized_default_construct, hpx::ranges::uninitialized_default_construct_n

Defined in header [hpx/algorithm.hpp](#)⁶⁷⁸.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **FwdIter**, typename **Sent**>
FwdIter uninitialized_default_construct(*FwdIter* first, *Sent* last)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns The *uninitialized_default_construct* algorithm returns a returns *FwdIter*. The *uninitialized_default_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**>

⁶⁷⁸ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorith.m.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_default_construct(ExPolicy  
    &&policy,  
    FwdIter  
    first,  
    Sent  
    last)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns The *uninitialized_default_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_default_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename Rng>  
hpx::traits::range_traits<Rng>::iterator_type uninitialized_default_construct(Rng &&rng)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters `Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters `rng` – Refers to the range to which will be default constructed.

Returns The `uninitialized_default_construct` algorithm returns a `returns hpx::traits::range_traits<Rng>::iterator_type`. The `uninitialized_default_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **Rng**>

*parallel::util::detail::algorithm_result<**ExPolicy**, typename `hpx::traits::range_traits<Rng>::iterator_type`>::type **uninitial***

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_default_construct` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be default constructed

Returns The `uninitialized_default_construct` algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `typename hpx::traits::range_traits<Rng>::iterator_type` otherwise. The `uninitialized_default_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **FwdIter**, typename **Size**>

*FwdIter **uninitialized_default_n**(**FwdIter** first, **Size** count)*

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range [first, first + count) by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct_n` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns The *uninitialized_default_construct_n* algorithm returns a *FwdIter*. The *uninitialized_default_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Size>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type uninitialized_default_construct_n(ExPolicy
&&policy,
FwdIter
first,
Size
count)
```

Constructs objects of type *typename iterator_traits<ForwardIt>::value_type* in the uninitialized storage designated by the range [first, first + count) by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns The *uninitialized_default_construct_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns

FwdIter otherwise. The *uninitialized_default_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx::ranges::uninitialized_fill, hpx::ranges::uninitialized_fill_n

Defined in header `hpx/algorithm.hpp`⁶⁷⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename FwdIter, typename Sent, typename T>
FwdIter uninitialized_fill(FwdIter first, Sent last, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the ranges *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns The *uninitialized_fill* algorithm returns a returns *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_fill(ExPolicy
&&policy,
FwdIter first,
Sent last, T
const
&value)
```

⁶⁷⁹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithm.hpp>

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns The *uninitialized_fill* algorithm returns a returns *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename Rng, typename T>
hpx::traits::range_traits<Rng>::iterator_type uninitialized_fill(Rng &&rng, T const &value)
Copies the given value to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.
```

The assignments in the parallel *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns The *uninitialized_fill* algorithm returns a returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename T>
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type uninitialized_fill(
    FwdIter first, Size count, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns The *uninitialized_fill* algorithm returns a *hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename hpx::traits::range_traits<Rng>::iterator_type* otherwise. The *uninitialized_fill* algorithm returns the iterator to one past the last element filled in the range.

```
template<typename FwdIter, typename Size, typename T>
FwdIter uninitialized_fill_n(FwdIter first, Size count, T const &value)
```

Copies the given *value* value to the first *count* elements in an uninitialized memory area beginning at *first*. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns The *uninitialized_fill_n* algorithm returns a *FwdIter*. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_fill_n(ExPolicy
    &&policy,
    FwdIter
    first, Size
    count, T
    const
    &value)
```

Copies the given *value* value to the first *count* elements in an uninitialized memory area beginning at *first*. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

- **value** – The value to be assigned.

Returns The *uninitialized_fill_n* algorithm returns a *hpx::future<FwdIter>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns FwdIter otherwise. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

hpx::ranges::uninitialized_move, hpx::ranges::uninitialized_move_n

Defined in header [hpx/algorithms.hpp](#)⁶⁸⁰.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename InIter, typename Sent1, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_move(InIter first1, Sent1 last1,
                                                               FwdIter first2, Sent2 last2)
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

⁶⁸⁰ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

Returns The *uninitialized_move* algorithm returns an *in_out_result*<*InIter*, *FwdIter*>. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**>

parallel::*util*::*detail*::*algorithm_result*<*ExPolicy*, *parallel*::*util*::*in_out_result*<*FwdIter1*, *FwdIter2*>>::*type* **uninitialized**

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at dest. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_move* algorithm returns a *hpx::future*<*in_out_result*<*InIter*, *FwdIter*>>, if the execution policy is of type *sequenced_task_policy* or *paral-*

lel_task_policy and returns *in_out_result<InIter, FwdIter>* otherwise. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

template<typename **Rng1**, typename **Rng2**>

*hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<**Rng1**>::iterator_type, typename hpx::traits::range_traits<**Rng2**>::iterator_type>*

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

Returns The *uninitialized_move* algorithm returns an *in_out_result<typename hpx::traits::range_traits<**Rng1**>::iterator_type, typename hpx::traits::range_traits<**Rng2**>::iterator_type>*. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**>

*parallel::util::detail::algorithm_result<**ExPolicy**, hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<**Rng1**>::iterator_type, typename hpx::traits::range_traits<**Rng2**>::iterator_type>>*

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

Returns The *uninitialized_move* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>` otherwise. The *uninitialized_move* algorithm returns the input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename InIter, typename Size, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_move_n(InIter first1, Size count,
                                                               FwdIter first2, Sent2 last2)
```

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* movements, if *count* > 0, no move operations otherwise.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_move_n* algorithm returns `in_out_result<InIter, FwdIter>`. The *uninitialized_move_n* algorithm returns the output iterator to the element in the destination

range, one past the last element moved.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type uninitialized_move_n
```

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* movements, if *count* > 0, no move operations otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns The *uninitialized_move_n* algorithm returns a *hpx::future<in_out_result<FwdIter1, FwdIter2>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_move_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

hpx::ranges::uninitialized_value_construct, hpx::ranges::uninitialized_value_construct_n

Defined in header `hpx/algorithms.hpp`⁶⁸¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename FwdIter, typename Sent>
FwdIter uninitialized_value_construct(FwdIter first, Sent last)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns The *uninitialized_value_construct* algorithm returns a returns `FwdIter`. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Sent>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_value_construct(ExPolicy
&&policy,
FwdIter
first,
Sent
last)
```

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

⁶⁸¹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns The *uninitialized_value_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_value_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **Rng**>

hpx::traits::range_traits<Rng>::iterator_type uninitialized_value_construct(Rng &&rng)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters rng – Refers to the range to which will be value constructed.

Returns The *uninitialized_value_construct* algorithm returns a *hpx::traits::range_traits<Rng>::iterator_type*. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **Rng**>

`parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type uninitialized_value_construct`

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_value_construct` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_value_construct` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be value constructed

Returns The `uninitialized_value_construct` algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `typename hpx::traits::range_traits<Rng>::iterator_type` otherwise. The `uninitialized_value_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.

`template<typename FwdIter, typename Size>`
`FwdIter uninitialized_value_construct_n(FwdIter first, Size count)`

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range $[first, first + count]$ by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_value_construct_n` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns The *uninitialized_value_construct_n* algorithm returns a *FwdIter*. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Size>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_value_construct_n(ExPolicy
    &&policy,
    FwdIter
    first,
    Size
    count)
```

Constructs objects of type *typename iterator_traits<ForwardIt>::value_type* in the uninitialized storage designated by the range [first, first + count) by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns The *uninitialized_value_construct_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx::ranges::unique, hpx::ranges::unique_copy

Defined in header `hpx/algorithms.hpp`⁶⁸².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename FwdIter, typename Sent, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
subrange_t<FwdIter, Sent> unique(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

⁶⁸² <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/algorithms.hpp>

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique* algorithm returns *subrange_t<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = ranges::equal_to,
typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type unique(ExPolicy
    &&policy,
    FwdIter
    first, Sent
    last, Pred
    &&pred =
    Pred(),
    Proj
    &&proj =
    Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal_to<>*
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Type2` must be such that objects of types `FwdIter` can be dereferenced and then implicitly converted to both `Type1` and `Type2`

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The `unique` algorithm returns `subrange_t<FwdIter, Sent>`. The `unique` algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename Rng, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>> unique(Rng
    &&rng,
    Pred
    &&pred =
    Pred(),
    Proj
    &&proj =
    Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range `rng` and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel `unique` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate `pred` and no more than twice as many applications of the projection `proj`, where N = `std::distance(begin(rng), end(rng))`.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last]. This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The `unique` algorithm returns `subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<Rng>>`. The `unique` algorithm returns an object {ret, last},

where `ret` is a past-the-end iterator for a new subrange.

```
template<typename ExPolicy, typename Rng, typename Pred = ranges::equal_to, typename Proj =
hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<hpx::traits::range_iterator_t<Rng>, hpx::traits::range_iterator_t<
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range `rng` and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel `unique` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `unique` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than N assignments, exactly $N - 1$ applications of the predicate `pred` and no more than twice as many applications of the projection `proj`, where $N = \text{std}::\text{distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last]. This is an binary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be

dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique* algorithm returns a *hpx::future* <subrange_t<*hpx::traits::range_iterator_t<Rng>*, *hpx::traits::range_iterator_t<Rng>>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *subrange_t<hpx::traits::range_iterator_t<Rng>*, *hpx::traits::range_iterator_t<Rng>>* otherwise. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename InIter, typename Sent, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
```

```
unique_copy_result<InIter, O> unique_copy(InIter first, Sent last, O dest, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal_to<>*
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

<code>bool pred(const Type &a, const Type &b);</code>

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique_copy* algorithm returns a `unique_copy_result<InIter, O>`. The *unique_copy* algorithm returns an `in_out_result` with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<FwdIter, O>>::type unique_copy(ExPolicy
    &&policy,
    FwdIter
    first,
    Sent
    last,
    O
    dest,
    Pred
    &&pred
    =
    Pred(),
    Proj
    &&proj
    =
    Proj())
```

Copies the elements from the range $[first, last)$, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than $last - first$ assignments, exactly $last - first - 1$ applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter1`.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique_copy* algorithm returns a `hpx::future<unique_copy_result<FwdIter, O>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *unique_copy_result<FwdIter, O>* otherwise. The *unique_copy* algorithm returns an *in_out_result* with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

```
template<typename Rng, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
unique_copy_result<hpx::traits::range_iterator_t<Rng>, O> unique_copy(Rng &&rng, O dest, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = `std::distance(begin(rng), end(rng))`.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be

equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter1` can be dereferenced and then implicitly converted to `Type`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The `unique_copy` algorithm returns `unique_copy_result<hpx::traits::range_iterator_t<Rng>, O>`. The `unique_copy` algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename Rng, typename O, typename Pred = ranges::equal_to,
typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<hpx::traits::range_iterator_t<Rng>, O>> unique_copy
```

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel `unique_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `unique_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = `std::distance(begin(rng), end(rng))`.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `unique_copy` requires *Pred* to meet the requirements of

CopyConstructible. This defaults to std::equal_to<>

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns The *unique_copy* algorithm returns a *hpx::future<unique_copy_result< hpx::traits::range_iterator_t<Rng>, O>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *unique_copy_result< hpx::traits::range_iterator_t<Rng>, O>* otherwise. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

hpx/parallel/util/range.hpp

template<typename Iterator, typename Sentinel = Iterator>
```

```
using range = hpx::util::iterator_range<Iterator, Sentinel>
```

Functions

```
template<typename Iter, typename Sent>
range<Iter, Sent> concat(range<Iter, Sent> const &it1, range<Iter, Sent> const &it2)

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2>
range<Iter2, Iter2> init_move(range<Iter2, Sent2> const &dest, range<Iter1, Sent1> const &src)
    Move objects from the range src to dest.
    Parameters
        • dest – [in] : range where move the objects
        • src – [in] : range from where move the objects
    Returns range with the objects moved and the size adjusted

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2>
range<Iter2, Sent2> uninit_move(range<Iter2, Sent2> const &dest, range<Iter1, Sent1> const
&src)
    Move objects from the range src creating them in dest.
    Parameters
        • dest – [in] : range where move and create the objects
        • src – [in] : range from where move the objects
    Returns range with the objects moved and the size adjusted

template<typename Iter, typename Sent>
void destroy_range(range<Iter, Sent> r)
    destroy a range of objects
    Parameters r – [in] : range to destroy

template<typename Iter, typename Sent>
range<Iter, Sent> init(range<Iter, Sent> const &r, typename std::iterator_traits<Iter>::value_type
&val)
    initialize a range of objects with the object val moving across them
    Parameters
        • r – [in] : range of elements not initialized
        • val – [in] : object used for the initialization
    Returns range initialized

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Compare>
bool is_mergeable(range<Iter1, Sent1> const &src1, range<Iter2, Sent2> const &src2, Compare
comp)
    : indicate if two ranges have a possible merge
```

Remark

Parameters

- **src1** – [in] : first range
- **src2** – [in] : second range
- **comp** – [in] : object for to compare elements

Returns true : they can be merged false : they can't be merged

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,
typename Sent3, typename Compare>
```

```
range<Iter3, Sent3> full_merge(range<Iter3, Sent3> const &dest, range<Iter1, Sent1> const
&src1, range<Iter2, Sent2> const &src2, Compare comp)
```

Merge two contiguous ranges src1 and src2 , and put the result in the range dest, returning the range merged.

Parameters

- **dest** – [in] : range where locate the elements merged. the size of dest must be greater or equal than the sum of the sizes of src1 and src2
- **src1** – [in] : first range to merge
- **src2** – [in] : second range to merge
- **comp** – [in] : comparison object

Returns range with the elements merged and the size adjusted

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Value,
typename Compare>
```

```
range<Value*> uninits_full_merge(range<Value*> const &dest, range<Iter1, Sent1> const
&src1, range<Iter2, Sent2> const &src2, Compare comp)
```

Merge two contiguous ranges src1 and src2 , and create and move the result in the uninitialized range dest, returning the range merged.

Parameters

- **dest** – [in] : range where locate the elements merged. the size of dest must be greater or equal than the sum of the sizes of src1 and src2. Initially is un-initialize memory
- **src1** – [in] : first range to merge
- **src2** – [in] : second range to merge
- **comp** – [in] : comparison object

Returns range with the elements merged and the size adjusted

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Value,
typename Compare>
```

```
range<Iter2, Sent2> half_merge(range<Iter2, Sent2> const &dest, range<Iter1, Sent1> const
&src1, range<Iter2, Sent2> const &src2, Compare comp)
```

: Merge two buffers. The first buffer is in a separate memory

Parameters

- **dest** – [in] : range where finish the two buffers merged
- **src1** – [in] : first range to merge in a separate memory
- **src2** – [in] : second range to merge, in the final part of the range where deposit the final results
- **comp** – [in] : object for compare two elements of the type pointed by the Iter1 and Iter2

Returns : range with the two buffers merged

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,
typename Sent3, typename Compare>
```

```
bool in_place_merge_uncontiguous(range<Iter1, Sent1> const &src1, range<Iter2, Sent2>
const &src2, range<Iter3, Sent3> &aux, Compare comp)
```

: merge two non contiguous buffers src1 , src2, using the range aux as auxiliary memory

Remark

Parameters

- **src1** – [in] : first range to merge
- **src2** – [in] : second range to merge

- **aux** – [in] : auxiliary range used in the merge
- **comp** – [in] : object for to compare elements

Returns true : not changes done false : changes in the buffers

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Compare>
range<Iter1, Sent1> in_place_merge(range<Iter1, Sent1> const &src1, range<Iter1, Sent1> const
&src2, range<Iter2, Sent2> &buf, Compare comp)
: merge two contiguous buffers ( src1, src2) using buf as auxiliary memory
```

Remark

Parameters

- **src1** – [in] : first range to merge
- **src2** – [in] : second range to merge
- **buf** – [in] : auxiliary memory used in the merge
- **comp** – [in] : object for to compare elements

Returns true : not changes done false : changes in the buffers

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Compare>
void merge_flow(range<Iter1, Sent1> rng1, range<Iter2, Sent2> rbuf, range<Iter1, Sent1> rng2,
Compare cmp)
```

asio

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/asio/asio_util.hpp

Defined in header hpx/asio/asio_util.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

Typedefs

```
using endpoint_iterator_type = asio::ip::tcp::resolver::iterator
```

Functions

```
bool get_endpoint(std::string const &addr, std::uint16_t port, asio::ip::tcp::endpoint &ep, bool force_ipv4 = false)

std::string get_endpoint_name(asio::ip::tcp::endpoint const &ep)

asio::ip::tcp::endpoint resolve_hostname(std::string const &hostname, std::uint16_t port,
                                       asio::io_context &io_service, bool force_ipv4 = false)

std::string resolve_public_ip_address()

std::string cleanup_ip_address(std::string const &addr)

endpoint_iterator_type connect_begin(std::string const &address, std::uint16_t port, asio::io_context &io_service)

template<typename Locality>
endpoint_iterator_type connect_begin(Locality const &loc, asio::io_context &io_service)

>Returns an iterator which when dereferenced will give an endpoint suitable for a call to connect() related to this locality.

inline endpoint_iterator_type connect_end()

endpoint_iterator_type accept_begin(std::string const &address, std::uint16_t port, asio::io_context &io_service)

template<typename Locality>
endpoint_iterator_type accept_begin(Locality const &loc, asio::io_context &io_service)

>Returns an iterator which when dereferenced will give an endpoint suitable for a call to accept() related to this locality.

inline endpoint_iterator_type accept_end()

bool split_ip_address(std::string const &v, std::string &host, std::uint16_t &port)
```

assertion

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/assertion/evaluate_assert.hpp

Defined in header hpx/assertion/evaluate_assert.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **assertion**

HPX_CURRENT_SOURCE_LOCATION, hpx::source_location

Defined in header `hpx/source_location.hpp`⁶⁸³.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_CURRENT_SOURCE_LOCATION()

namespace `hpx`

Functions

`std::ostream &operator<<(std::ostream &os, source_location const &loc)`

struct `source_location`

`#include <source_location.hpp>` This contains the location information where *HPX_ASSERT* has been called. The `source_location` class represents certain information about the source code, such as file names, line numbers, and function names. Previously, functions that desire to obtain this information about the call site (for logging, testing, or debugging purposes) must use macros so that predefined macros like `__FILE__` and `__LINE__` are expanded in the context of the caller. The `source_location` class provides a better alternative. `source_location` meets the *DefaultConstructible*, *CopyConstructible*, *CopyAssignable* and *Destructible* requirements. Lvalue of `source_location` meets the *Swappable* requirement. Additionally, the following conditions are true:

•

`std::is_nothrow_move_constructible_v<std::source_location>`

•

`std::is_nothrow_move_assignable_v<std::source_location>`

•

`std::is_nothrow_swappable_v<std::source_location>`

It is intended that `source_location` has a small size and can be copied efficiently. It is unspecified whether the copy/move constructors and the copy/move assignment operators of `source_location` are trivial and/or `constexpr`.

⁶⁸³ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/source_location.hpp

Public Functions

```
inline constexpr std::uint_least32_t line() const noexcept
    return the line number represented by this object

inline constexpr char const *file_name() const noexcept
    return the file name represented by this object

inline constexpr char const *function_name() const noexcept
    return the name of the function represented by this object, if any
```

Public Members

```
char const *filename

std::uint_least32_t line_number

char const *functionname
```

Public Static Functions

using instead = hpx::source_location
```

HPX_ASSERT, HPX_ASSERT_MSG

Defined in header hpx/assert.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_ASSERT(expr)

This macro asserts that *expr* evaluates to true.

If *expr* evaluates to false, The source location and *msg* is being printed along with the expression and additional. Afterwards the program is being aborted. The assertion handler can be customized by calling *hpx*::assertion::set_assertion_handler().

Asserts are enabled if *HPX_DEBUG* is set. This is the default for CMAKE_BUILD_TYPE=Debug

Parameters

- **expr** – The expression to assert on. This can either be an expression that's convertible to bool or a callable which returns bool
- **msg** – The optional message that is used to give further information if the assert fails. This should be convertible to a std::string

`HPX_ASSERT_MSG(expr, msg)`

See also:

`HPX_ASSERT`

namespace `hpx`

namespace `assertion`

Typedefs

```
using assertion_handler = void (*)(hpx::source_location const &loc, const char *expr, std::string const &msg)
```

The signature for an assertion handler.

Functions

`void set_assertion_handler(assertion_handler handler)`

Set the assertion handler to be used within a program. If the handler has been set already once, the call to this function will be ignored.

Note: This function is not thread safe

`async_base`

See *Public API* for a list of names and headers that are part of the public HPX API.

`hpx::async`

Defined in header `hpx/future.hpp`⁶⁸⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace `hpx`

⁶⁸⁴ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

Functions

```
template<typename F, typename ...Ts>
decltype(auto) async(F &&f, Ts&&... ts)
```

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns an *hpx::future* that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being *hpx::launch::async* | *hpx::launch::deferred*. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the *async* flag is set (i.e. `(policy & hpx::launch::async) != 0`), then *async* executes the callable object *f* on a new thread of execution (with all thread-locals initialized) as if spawned by *hpx::thread(std::forward<F>(f), std::forward<Ts>(ts)...)*, except that if the function *f* returns a value or throws an exception, it is stored in the shared state accessible through the *hpx::future* that *async* returns to the caller.
- If the *deferred* flag is set (i.e. `(policy & hpx::launch::deferred) != 0`), then *async* converts *f* and *ts...* the same way as by *hpx::thread* constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the *hpx::future* that *async* returned to the caller will cause the copy of *f* to be invoked (as an rvalue) with the copies of *ts...* (also passed as rvalues) in the current thread (which does not have to be the thread that originally called *hpx::async*). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same *hpx::future* will return the result immediately.
- If neither *hpx::launch::async* nor *hpx::launch::deferred*, nor any implementation-defined policy flag is set in *policy*, the behavior is undefined.

If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the *hpx::launch::async* and *hpx::launch::deferred* flags are set in *policy*), standard recommends (but doesn't require) utilizing available concurrency, and deferring any additional tasks.

In any case, the call to *hpx::async* synchronizes-with (as defined in *std::memory_order*) the call to *f*, and the completion of *f* is sequenced-before making the shared state ready. If the *async* policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If *std::decay<Function>::type* or each type in *std::decay<Ts>::type* is not constructible from its corresponding argument, the program is ill-formed.

Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to *f*

Returns *hpx::future* referring to the shared state created by this call to *hpx::async*.

hpx::dataflow

Defined in header *hpx/future.hpp*⁶⁸⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

⁶⁸⁵ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

Functions

```
template<typename F, typename ...Ts>
decltype(auto) dataflow(F &&f, Ts&&... ts)
```

The function template *dataflow* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a *hpx::future* that will eventually hold the result of that function call. Its behavior is similar to *hpx::async* with the exception that if one of the arguments is a *future*, then *hpx::dataflow* will wait for the *future* to be ready to launch the thread. Hence, the operation is delayed until all the arguments are ready.

hpx::launch

Defined in header *hpx/future.hpp*⁶⁸⁶.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

```
struct launch : public detail::policy_holder<>
    #include <launch_policy.hpp> Launch policies for hpx::async etc.
```

Public Functions

```
inline constexpr launch() noexcept
```

Default constructor. This creates a launch policy representing all possible launch modes

```
inline constexpr launch(detail::async_policy p) noexcept
```

Create a launch policy representing asynchronous execution.

```
inline constexpr launch(detail::fork_policy p) noexcept
```

Create a launch policy representing asynchronous execution. The new thread is executed in a preferred way

```
inline constexpr launch(detail::sync_policy p) noexcept
```

Create a launch policy representing synchronous execution.

```
inline constexpr launch(detail::deferred_policy p) noexcept
```

Create a launch policy representing deferred execution.

```
inline constexpr launch(detail::apply_policy p) noexcept
```

Create a launch policy representing fire and forget execution.

```
template<typename F>
```

```
inline constexpr launch(detail::select_policy<F> const &p) noexcept
```

Create a launch policy representing fire and forget execution.

```
template<typename Launch, typename Enable =
```

```
std::enable_if_t<hpx::traits::is_launch_policy_v<Launch>>>
```

```
inline constexpr launch(Launch l, threads::thread_priority priority, threads::thread_stacksize stacksize,
threads::thread_schedule_hint hint) noexcept
```

⁶⁸⁶ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

Public Static Attributes

static const detail::async_policy **async**

Predefined launch policy representing asynchronous execution.

static const detail::fork_policy **fork**

Predefined launch policy representing asynchronous execution. The new thread is executed in a preferred way

static const detail::sync_policy **sync**

Predefined launch policy representing synchronous execution.

static const detail::deferred_policy **deferred**

Predefined launch policy representing deferred execution.

static const detail::apply_policy **apply**

Predefined launch policy representing fire and forget execution.

static const detail::select_policy_generator **select**

Predefined launch policy representing delayed policy selection.

inline friend **constexpr friend hpx::threads::thread_schedule_hint tag_invoke** (*hpx::execution::experimental::with_hint_t*, *launch* const &policy) noexcept

hpx::post

Defined in header `hpx/future.hpp`⁶⁸⁷.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Functions

```
template<typename F, typename ...Ts>
bool post(F &&f, Ts&&... ts)
```

Runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool). This is done in a fire-and-forget manner, meaning there is no return value or way to synchronize with the function execution (it does not return an `hpx::future` that would hold the result of that function call).

`hpx::post` is particularly useful when synchronization mechanisms as heavyweight as futures are not desired, and instead, more lightweight mechanisms like latches or atomic variables are preferred. Essentially, the `post` function enables the launch of a new thread without the overhead of creating a future.

Note: `hpx::post` is similar to `hpx::async` but does not return a future. This is why there is no way of finding out the result/failure of the execution of this function.

hpx::sync

Defined in header `hpx/future.hpp`⁶⁸⁸.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Functions

```
template<typename F, typename ...Ts>
decltype(auto) sync(F &&f, Ts&&... ts)
```

The function template `sync` runs the function *f* synchronously and returns an `hpx::future` that will eventually hold the result of that function call.

⁶⁸⁷ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

⁶⁸⁸ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

async_combinators

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/async_combinators/split_future.hpp

Defined in header hpx/async_combinators/split_future.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 Top level HPX namespace.

Functions

```
template<typename ...Ts>
inline tuple<future<Ts>...> split_future(future<tuple<Ts...>> &&f)
```

The function *split_future* is an operator allowing to split a given future of a sequence of values (any tuple, std::pair, or std::array) into an equivalent container of futures where each future represents one of the values from the original future. In some sense this function provides the inverse operation of *when_all*.

Note: The following cases are special:

```
tuple<future<void> > split_future(future<tuple<>> && f);
array<future<void>, 1> split_future(future<array<T, 0>> && f);
```

here the returned futures are directly representing the futures which were passed to the function.

Parameters **f** – [in] A future holding an arbitrary sequence of values stored in a tuple-like container. This facility supports *hpx::tuple<>*, *std::pair<T1, T2>*, and *std::array<T, N>*

Returns Returns an equivalent container (same container type as passed as the argument) of futures, where each future refers to the corresponding value in the input parameter. All of the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

```
template<typename T>
inline std::vector<future<T>> split_future(future<std::vector<T>> &&f, std::size_t size)
```

The function *split_future* is an operator allowing to split a given future of a sequence of values (any std::vector) into a std::vector of futures where each future represents one of the values from the original std::vector. In some sense this function provides the inverse operation of *when_all*.

Parameters

- **f** – [in] A future holding an arbitrary sequence of values stored in a std::vector.
- **size** – [in] The number of elements the vector will hold once the input future has become ready

Returns Returns a std::vector of futures, where each future refers to the corresponding value in the input parameter. All of the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

hpx::wait_all

Defined in header `hpx/future.hpp`⁶⁸⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

```
template<typename InputIter>
void wait_all(InputIter first, InputIter last)
```

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

Note: The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

Parameters

- **first** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all` should wait.
- **last** – The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `wait_all` should wait.

```
template<typename R>
void wait_all(std::vector<future<R>> &&futures)
```

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

Note: The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

Parameters `futures` – A vector or array holding an arbitrary amount of `future` or `shared_future` objects for which `wait_all` should wait.

```
template<typename R, std::size_t N>
```

⁶⁸⁹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

```
void wait_all(std::array<future<R>, N) &&futures)
```

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

Note: The function *wait_all* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters **futures** – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_all* should wait.

```
template<typename T>
void wait_all(hpx::future<T> const &f)
```

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all* returns after the future has become ready. The input future is still valid after *wait_all* returns.

Note: The function *wait_all* will rethrow any exceptions captured by the future while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters **f** – A *future* or *shared_future* for which *wait_all* should wait.

```
template<typename ...T>
void wait_all(T&&... futures)
```

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

Note: The function *wait_all* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_all* should wait.

```
template<typename InputIter>
void wait_all_n(InputIter begin, std::size_t count)
```

The function *wait_all_n* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function `wait_all_n` returns after all futures have become ready. All input futures are still valid after `wait_all_n` returns.

Note: The function `wait_all_n` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_n_nothrow` instead.

Parameters

- **begin** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all_n` should wait.
- **count** – The number of elements in the sequence starting at `first`.

Returns The function `wait_all_n` will return an iterator referring to the first element in the input sequence after the last processed element.

`hpx::wait_any`

Defined in header `hpx/future.hpp`⁶⁹⁰.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace `hpx`

Top level HPX namespace.

Functions

```
template<typename InputIter>
void wait_any(InputIter first, InputIter last)
```

The function `wait_any` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function `wait_any` returns after at least one future has become ready. All input futures are still valid after `wait_any` returns.

Note: The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_any` should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `wait_any` should wait.

⁶⁹⁰ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

```
template<typename R>
void wait_any(std::vector<future<R>> &futures)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note: The function *wait_any* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters **futures** – [in] A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_any* should wait.

```
template<typename R, std::size_t N>
void wait_any(std::array<future<R>, N> &futures)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note: The function *wait_any* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters **futures** – [in] An array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_any* should wait.

```
template<typename ...T>
void wait_any(T&... futures)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note: The function *wait_any* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_any* should wait.

```
template<typename InputIter>
```

```
void wait_any_n(InputIter first, std::size_t count)
```

The function *wait_any_n* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any_n* returns after at least one future has become ready. All input futures are still valid after *wait_any_n* returns.

Note: The function *wait_any_n* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_n_nothrow* instead.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_any_n* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

hpx::wait_each

Defined in header `hpx/future.hpp`⁶⁹¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

```
template<typename F, typename Future>
void wait_each(F &&f, std::vector<Future> &&futures)
```

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_each* should wait.

⁶⁹¹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

```
template<typename F, typename Iterator>
void wait_each(F &&f, Iterator begin, Iterator end)
```

The function `wait_each` is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. `wait_each` returns after all futures have been become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which `wait_each` should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which `wait_each` should wait.

```
template<typename F, typename ...T>
void wait_each(F &&f, T&&... futures)
```

The function `wait_each` is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. `wait_each` returns after all futures have been become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which `wait_each` should wait.

```
template<typename F, typename Iterator>
void wait_each_n(F &&f, Iterator begin, std::size_t count)
```

The function `wait_each` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that `std::size_t` is

implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

hpx::wait_some

Defined in header `hpx/future.hpp`⁶⁹².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level HPX namespace.

Functions

```
template<typename InputIter>
void wait_some(std::size_t n, InputIter first, InputIter last)
```

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function *wait_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the function to return.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.

```
template<typename R>
```

⁶⁹² <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

```
void wait_some(std::size_t n, std::vector<future<R>> &&futures)
```

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function *wait_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- ***n*** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- ***futures*** – [in] A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_some* should wait.

```
template<typename R, std::size_t N>
```

```
void wait_some(std::size_t n, std::array<future<R>, N &&futures)
```

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function *wait_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- ***n*** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- ***futures*** – [in] An array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_some* should wait.

```
template<typename ...T>
```

```
void wait_some(std::size_t n, T&&... futures)
```

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The function *wait_all* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which `wait_some` should wait.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
template<typename InputIter>
void wait_some_n(std::size_t n, InputIter first, std::size_t count)
```

The function `wait_some_n` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The function `wait_some_n` returns after *n* futures have become ready. All input futures are still valid after `wait_some_n` returns.

Note: The function `wait_some_n` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_n_nothrow` instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which `when_all` should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

hpx::when_all

Defined in header `hpx/future.hpp`⁶⁹³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level HPX namespace.

⁶⁹³ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

Functions

```
template<typename InputIter, typename Container = vector<future<typename  
std::iterator_traits<InputIter>::value_type>>>  
hpx::future<Container> when_all(InputIter first, InputIter last)
```

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: Calling this version of *when_all* where *first* == *last*, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.

Returns Returns a future holding the same list of futures as has been passed to *when_all*.

- *future<Container<future<R>>>*: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>  
hpx::future<Range> when_all(Range &&values)
```

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: Calling this version of *when_all* where the input container is empty, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters **values** – [in] A range holding an arbitrary amount of *future* or *shared_future* objects for which *when_all* should wait.

Returns Returns a future holding the same list of futures as has been passed to *when_all*.

- *future<Container<future<R>>>*: If the input cardinality is unknown at compile time and the futures are all of the same type.

```
template<typename ...T>  
hpx::future<hpx::tuple<hpx::future<T>...>> when_all(T &&... futures)
```

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It

AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *when_all* should wait.

Returns Returns a future holding the same list of futures as has been passed to *when_all*.

- *future<tuple<future<T0>, future<T1>, future<T2>...>>*: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- *future<tuple<>>* if *when_all* is called with zero arguments. The returned future will be initially ready.

```
template<typename InputIter, typename Container = vector<future<typename
std::iterator_traits<InputIter>::value_type>>>
hpx::future<Container> when_all_n(InputIter begin, std::size_t count)

function when_all creates a future object that becomes ready when all elements in a set of future and shared_future objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.
```

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: None of the futures in the input sequence are invalidated.

Parameters

- **begin** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_all_n* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

Throws This – function will throw errors which are encountered while setting up the requested operation only. Errors encountered while executing the operations delivering the results to be stored in the futures are reported through the futures themselves.

Returns Returns a future holding the same list of futures as has been passed to *when_all_n*.

- *future<Container<future<R>>>*: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output vector will be the same as given by the input iterator.

hpx::when_any

Defined in header `hpx/future.hpp`⁶⁹⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 Top level HPX namespace.

Functions

```
template<typename InputIter, typename Container = vector<future<typename  
std::iterator_traits<InputIter>::value_type>>>  
future<when_any_result<Container>> when_any(InputIter first, InputIter last)
```

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_any* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_any* should wait.

Returns Returns a *when_any_result* holding the same list of futures as has been passed to *when_any* and an index pointing to a ready future.

- *future<when_any_result<Container<future<R>>>*: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
```

```
future<when_any_result<Range>> when_any(Range &values)
```

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters values – [in] A range holding an arbitrary amount of *futures* or *shared_future* objects for which *when_any* should wait.

Returns Returns a *when_any_result* holding the same list of futures as has been passed to *when_any* and an index pointing to a ready future.

- *future<when_any_result<Container<future<R>>>*: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename ...T>
```

```
future<when_any_result<tuple<future<T>...>>> when_any(T&&... futures)
```

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given

⁶⁹⁴ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *when_any* should wait.

Returns Returns a *when_any_result* holding the same list of futures as has been passed to *when_any* and an index pointing to a ready future..

- *future<when_any_result<tuple<future<T0>, future<T1>...>>>*: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- *future<when_any_result<tuple<>>>* if *when_any* is called with zero arguments. The returned future will be initially ready.

```
template<typename InputIter, typename Container = vector<future<typename
std::iterator_traits<InputIter>::value_type>>>
future<when_any_result<Container>> when_any_n(InputIter first, std::size_t count)
```

function *when_any_n* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Note: None of the futures in the input sequence are invalidated.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_any_n* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

Returns Returns a *when_any_result* holding the same list of futures as has been passed to *when_any* and an index pointing to a ready future.

- *future<when_any_result<Container<future<R>>>>*: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Sequence>
struct when_any_result
#include <when_any.hpp> Result type for when_any, contains a sequence of futures and an index pointing to a ready future.
```

Public Members

std::size_t index

The index of a future which has become ready.

Sequence futures

The sequence of futures as passed to `hpx::when_any`

hpx::when_each

Defined in header `hpx/future.hpp`⁶⁹⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

```
template<typename F, typename Future>
future<void> when_each(F &&f, std::vector<Future> &&futures)
```

The function `when_each` is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a `future` to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the `future` as the second parameter. The first parameter will correspond to the index of the current `future` in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of `future` or `shared_future` objects for which `wait_each` should wait.

Returns Returns a future representing the event of all input futures being ready.

```
template<typename F, typename Iterator>
future<Iterator> when_each(F &&f, Iterator begin, Iterator end)
```

The function `when_each` is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a `future` to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the `future` as the second parameter. The first parameter will correspond to the index of the current `future` in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_each` should wait.

⁶⁹⁵ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

- **end** – The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.

Returns Returns a future representing the event of all input futures being ready.

```
template<typename F, typename ...Ts>
future<void> when_each(F &&f, Ts&&... futures)
```

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_each* should wait.

Returns Returns a future representing the event of all input futures being ready.

```
template<typename F, typename Iterator>
future<Iterator> when_each_n(F &&f, Iterator begin, std::size_t count)
```

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

Returns Returns a future holding the iterator pointing to the first element after the last one.

hpx::when_some

Defined in header `hpx/future.hpp`⁶⁹⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

```
template<typename InputIter, typename Container = vector<future<typename  
std::iterator_traits<InputIter>::value_type>>>  
future<when_some_result<Container>> when_some(std::size_t n, Iterator first, Iterator last)
```

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The future returned by the function *when_some* becomes ready when at least *n* argument futures have become ready.

Note: Calling this version of *when_some* where *first == last*, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.

Returns Returns a *when_some_result* holding the same list of futures as has been passed to *when_some* and indices pointing to ready futures.

- *future<when_some_result<Container<future<R>>>*: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>  
future<when_some_result<Range>> when_some(std::size_t n, Range &&futures)
```

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

⁶⁹⁶ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

Note: The future returned by the function `when_some` becomes ready when at least *n* argument futures have become ready.

Note: Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_some` will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A container holding an arbitrary amount of *future* or *shared_future* objects for which `when_some` should wait.

Returns Returns a `when_some_result` holding the same list of futures as has been passed to `when_some` and indices pointing to ready futures.

- `future<when_some_result<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename ...Ts>
future<when_some_result<tuple<future<T>...>>> when_some(std::size_t n, Ts&&... futures)
```

The function `when_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The future returned by the function `when_some` becomes ready when at least *n* argument futures have become ready.

Note: Each future and shared_future is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_some` will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which `when_some` should wait.

Returns Returns a `when_some_result` holding the same list of futures as has been passed to `when_some` and an index pointing to a ready future..

- `future<when_some_result<tuple<future<T0>, future<T1>...>>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- `future<when_some_result<tuple<>>>` if `when_some` is called with zero arguments. The returned future will be initially ready.

```
template<typename InputIter, typename Container = vector<future<typename  
std::iterator_traits<InputIter>::value_type>>>  
future<when_some_result<Container>> when_some_n(std::size_t n, Iterator first, std::size_t count)
```

The function `when_some_n` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after `n` of them finished executing.

Note: The future returned by the function `when_some_n` becomes ready when at least `n` argument futures have become ready.

Note: Calling this version of `when_some_n` where `count == 0`, returns a future with the same elements as the arguments that is immediately ready. Possibly none of the futures in that container are ready. Each future and `shared_future` is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_some_n` will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.
- **count** – [in] The number of elements in the sequence starting at `first`.

Returns Returns a `when_some_result` holding the same list of futures as has been passed to `when_some` and indices pointing to ready futures.

- `future<when_some_result<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Sequence>
```

```
struct when_some_result
```

```
#include <when_some.hpp> Result type for when_some, contains a sequence of futures and indices pointing to ready futures.
```

Public Members

```
std::vector<std::size_t> indices
```

List of indices of futures that have become ready.

```
Sequence futures
```

The sequence of futures as passed to `hpx::when_some`.

cache

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/cache/local_cache.hpp

Defined in header hpx/cache/local_cache.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

namespace **cache**

```
template<typename Key, typename Entry, typename UpdatePolicy = std::less<Entry>, typename
InsertPolicy = policies::always<Entry>, typename CacheStorage = std::map<Key, Entry>,
typename Statistics = statistics::no_statistics>
class local_cache
```

#include <hpx/cache/local_cache.hpp> The local_cache implements the basic functionality needed for a local (non-distributed) cache.

Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache, must model the CacheEntry concept
- **UpdatePolicy** – A (optional) type specifying a (binary) function object used to sort the cache entries based on their ‘age’. The ‘oldest’ entries (according to this sorting criteria) will be discarded first if the maximum capacity of the cache is reached. The default is std::less<Entry>. The function object will be invoked using 2 entry instances of the type *Entry*. This type must model the UpdatePolicy model.
- **InsertPolicy** – A (optional) type specifying a (unary) function object used to allow global decisions whether a particular entry should be added to the cache or not. The default is *policies::always*, imposing no global insert related criteria on the cache. The function object will be invoked using the entry instance to be inserted into the cache. This type must model the InsertPolicy model.
- **CacheStorage** – A (optional) container type used to store the cache items. The container must be an associative and STL compatible container. The default is a std::map<Key, Entry>.

- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type `statistics::no_statistics` which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

```
using key_type = Key
using entry_type = Entry
using update_policy_type = UpdatePolicy
using insert_policy_type = InsertPolicy
using storage_type = CacheStorage
using statistics_type = Statistics
using value_type = typename entry_type::value_type
using size_type = typename storage_type::size_type
using storage_value_type = typename storage_type::value_type
```

Public Functions

```
inline explicit local_cache(size_type max_size = 0, update_policy_type const &up =
                           update_policy_type() , insert_policy_type const &ip =
                           insert_policy_type())
```

Construct an instance of a *local_cache*.

Parameters

- **max_size** – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get_size* function.
- **up** – [in] An instance of the *UpdatePolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *UpdatePolicy* template parameter.
- **ip** – [in] An instance of the *InsertPolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *InsertPolicy* template parameter.

local_cache(*local_cache* const &other) = default

local_cache(*local_cache* &&other) = default

local_cache &**operator=**(*local_cache* const &other) = default

```
local_cache &operator=(local_cache &&other) = default
```

```
~local_cache() = default
```

```
inline constexpr size_type size() const noexcept
```

Return current size of the cache.

Returns The current size of this cache instance.

```
inline constexpr size_type capacity() const noexcept
```

Access the maximum size the cache is allowed to grow to.

Note: The unit of this value is usually determined by the unit of the return values of the entry's function `entry::get_size`.

Returns The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

```
inline bool reserve(size_type max_size)
```

Change the maximum size this cache can grow to.

Parameters `max_size` – [in] The new maximum size this cache will be allowed to grow to.

Returns This function returns `true` if successful. It returns `false` if the new `max_size` is smaller than the current limit and the cache could not be shrunk to the new maximum size.

```
inline bool holds_key(key_type const &k) const
```

Check whether the cache currently holds an entry identified by the given key.

Note: This function does not call the entry's function `entry::touch`. It just checks if the cache contains an entry corresponding to the given key.

Parameters `k` – [in] The key for the entry which should be looked up in the cache.

Returns This function returns `true` if the cache holds the referenced entry, otherwise it returns `false`.

```
inline bool get_entry(key_type const &k, key_type &realkey, entry_type &val)
```

Get a specific entry identified by the given key.

Note: The function will call the entry's `entry::touch` function if the value corresponding to the provided key is found in the cache.

Parameters

- `k` – [in] The key for the entry which should be retrieved from the cache.
- `realkey[out]` – Return the full real key found in the cache
- `val` – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns This function returns `true` if the cache holds the referenced entry, otherwise it returns `false`.

```
inline bool get_entry(key_type const &k, entry_type &val)
```

Get a specific entry identified by the given key.

Note: The function will call the entry's *entry::touch* function if the value corresponding to the provided key is found in the cache.

Parameters

- **k** – [in] The key for the entry which should be retrieved from the cache.
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &k, *value_type* &val)

Get a specific entry identified by the given key.

Note: The function will call the entry's *entry::touch* function if the value corresponding to the provided is found in the cache.

Parameters

- **k** – [in] The key for the entry which should be retrieved from the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding value.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **insert**(*key_type* const &k, *value_type* const &val)

Insert a new element into this cache.

Note: This function invokes both, the insert policy as provided to the constructor and the function *entry::insert* of the newly constructed entry instance. If either of these functions returns false the key/value pair doesn't get inserted into the cache and the *insert* function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters

- **k** – [in] The key for the entry which should be added to the cache.
- **val** – [in] The value which should be added to the cache.

Returns This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

inline bool **insert**(*key_type* const &k, *value_type* &&val)

template<typename *Entry_*, *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry_*>, *entry_type*>, int> = 0>

inline bool **insert**(*key_type* const &k, *Entry_* &&e)

Insert a new entry into this cache.

Note: This function invokes both, the insert policy as provided to the constructor and the function *entry::insert* of the provided entry instance. If either of these functions returns false the key/value pair doesn't get inserted into the cache and the *insert* function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the

cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters

- **k** – [in] The key for the entry which should be added to the cache.
- **e** – [in] The entry which should be added to the cache.

Returns This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

```
template<typename Value, std::enable_if_t<std::is_convertible_v<std::decay_t<Value>,  
value_type>, int> = 0>  
inline bool update(key_type const &k, Value &&val)
```

Update an existing element in this cache.

Note: The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

Returns This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename F, typename Value, typename =  
std::enable_if_t<std::is_convertible_v<std::decay_t<Value>, value_type>>>  
inline bool update_if(key_type const &k, Value &&val, F &&f)
```

Update an existing element in this cache.

Note: The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

Returns This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>,  
entry_type>, int> = 0>  
inline bool update(key_type const &k, Entry_ &&e)
```

Update an existing entry in this cache.

Note: The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the whole cache entry, while the other overload replaces the cached value only, leaving the cache entry properties untouched.

Parameters

- **k** – [in] The key for the entry which should be updated in the cache.
- **e** – [in] The entry which should be used as a replacement for the existing entry in the cache. Any existing entry is first removed and then this entry is added.

Returns This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Func = policies::always<storage_value_type>>  
inline size_type erase(Func &&ep = Func())
```

Remove stored entries from the cache for which the supplied function object returns true.

Parameters **ep** – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*. Even then the entry might not be removed from the cache as its *entry::remove* function might return false.

Returns This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

```
inline size_type erase()
```

Remove all stored entries from the cache.

Note: All entries are considered for removal, but in the end an entry might not be removed from the cache as its *entry::remove* function might return false. This function is very useful for instance in conjunction with an entry's *entry::remove* function enforcing additional criteria like entry expiration, etc.

Returns This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

```
inline void clear()
```

Clear the cache.

Unconditionally removes all stored entries from the cache.

```
inline constexpr statistics_type const &get_statistics() const noexcept
```

Allow to access the embedded statistics instance.

Returns This function returns a reference to the statistics instance embedded inside this cache

```
inline statistics_type &get_statistics() noexcept
```

Public Members

Func **f_**

hpx/cache/lru_cache.hpp

Defined in header hpx/cache/lru_cache.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

namespace **cache**

```
template<typename Key, typename Entry, typename Statistics = statistics::no_statistics>
```

class **lru_cache**

```
#include <hpx/cache/lru_cache.hpp> The lru_cache implements the basic functionality needed
for a local (non-distributed) LRU cache.
```

Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type *statistics::no_statistics* which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using **key_type** = *Key*

using **entry_type** = *Entry*

using **statistics_type** = *Statistics*

using **entry_pair** = *std::pair<key_type, entry_type>*

```
using storage_type = std::list<entry_pair>

using map_type = std::map<Key, typename storage_type::iterator>

using size_type = std::size_t
```

Public Functions

inline explicit **lru_cache**(*size_type* max_size = 0)

Construct an instance of a *lru_cache*.

Parameters **max_size** – [in] The maximal size this cache is allowed to reach any time.

The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get_size* function.

lru_cache(*lru_cache* const &other) = default

lru_cache(*lru_cache* &&other) = default

lru_cache &**operator=**(*lru_cache* const &other) = default

lru_cache &**operator=**(*lru_cache* &&other) = default

~lru_cache() = default

inline constexpr *size_type* **size**() const noexcept

Return current size of the cache.

Returns The current size of this cache instance.

inline constexpr *size_type* **capacity**() const noexcept

Access the maximum size the cache is allowed to grow to.

Note: The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get_size*.

Returns The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

inline void **reserve**(*size_type* max_size)

Change the maximum size this cache can grow to.

Parameters **max_size** – [in] The new maximum size this cache will be allowed to grow to.

inline bool **holds_key**(*key_type* const &key) const

Check whether the cache currently holds an entry identified by the given key.

Note: This function does not call the entry's function *entry::touch*. It just checks if the cache contains an entry corresponding to the given key.

Parameters **key** – [in] The key for the entry which should be looked up in the cache.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &key, *key_type* &realkey, *entry_type* &entry)
Get a specific entry identified by the given key.

Note: The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Parameters

- **key** – [in] The key for the entry which should be retrieved from the cache.
- **realkey**[out] – Return the full real key found in the cache
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &key, *entry_type* const &entry)
Get a specific entry identified by the given key.

Note: The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Parameters

- **key** – [in] The key for the entry which should be retrieved from the cache.
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

template<typename **Entry**_, typename =
std::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry*_>, *entry_type*>>>
inline bool **insert**(*key_type* const &key, *Entry*_ &&entry)

Insert a new entry into this cache.

Note: This function assumes that the entry is not in the cache already. Inserting an already existing entry is considered undefined behavior

Parameters

- **key** – [in] The key for the entry which should be added to the cache.
- **entry** – [in] The entry which should be added to the cache.

template<typename **Entry**_, typename =
std::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry*_>, *entry_type*>>>
inline void **update**(*key_type* const &key, *Entry*_ &&entry)

Update an existing element in this cache.

Note: The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the

cache entry properties.

Parameters

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The entry which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

```
template<typename F, typename Entry_>
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>
inline bool update_if(key_type const &key, Entry_ &&entry, F &&f)
```

Update an existing element in this cache.

Note: The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

Returns This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Func>
inline size_type erase(Func const &ep)
```

Remove stored entries from the cache for which the supplied function object returns true.

Parameters **ep** – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*.

Returns This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry*::*get_size* functions of the removed entries).

```
inline size_type erase()
```

Remove all stored entries from the cache.

Returns This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry*::*get_size* functions of the removed entries).

```
inline size_type clear()
```

Clear the cache.

Unconditionally removes all stored entries from the cache.

```
inline constexpr statistics_type const &get_statistics() const noexcept
```

Allow to access the embedded statistics instance.

Returns This function returns a reference to the statistics instance embedded inside this cache

```
inline statistics_type &get_statistics() noexcept
```

Private Types

hpx/cache/entries/entry.hpp

Defined in header hpx/cache/entries/entry.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **util**

 namespace **cache**

 namespace **entries**

```
class entry
#include <hpx/cache/entries/entry.hpp>
Template Parameters
• Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.
• Derived – The (optional) type for which this type is used as a base class.
```

Public Types

```
using value_type = Value
```

Public Functions

```
entry() = default
```

Any cache entry has to be default constructible.

```
inline explicit entry(value_type const &val)
    noexcept(std::is_nothrow_copy_constructible_v<value_type>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit entry(value_type &&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline value_type &get() noexcept
```

Get a reference to the stored data value.

Note: This function is part of the CacheEntry concept

```
inline constexpr value_type const &get() const noexcept
```

Public Static Functions

```
static inline constexpr bool touch() noexcept
```

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

Note: It is possible to change the entry in a way influencing the sort criteria mandated by the UpdatePolicy. In this case the function should return *true* to indicate this to the cache, forcing to reorder the cache entries.

Note: This function is part of the CacheEntry concept

Returns This function should return true if the cache needs to update its internal heap.

Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

```
static inline constexpr bool insert() noexcept
```

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

Note: This function is part of the CacheEntry concept

Returns This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

```
static inline constexpr bool remove() noexcept
```

The function *remove* is called by a cache holding this instance whenever it is about to be removed from the cache.

Note: This function is part of the CacheEntry concept

Returns The return value can be used to avoid removing this instance from the cache. If the value is *true* it is ok to remove the entry, other wise it will stay in the cache.

```
static inline constexpr std::size_t get_size() noexcept
```

Return the ‘size’ of this entry. By default the size of each entry is just one (1), which is sensible if the cache has a limit (capacity) measured in number of entries.

Private Members

value_type **value_**

Friends

```
inline friend bool operator<(entry const &lhs, entry const &rhs)
    noexcept(noexcept(std::declval<value_type const&>() <
        std::declval<value_type const&>()))
```

Forwarding operator< allowing to compare entries instead of the values.

hpx/cache/entries/fifo_entry.hpp

Defined in header hpx/cache/entries/fifo_entry.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **util**

 namespace **cache**

 namespace **entries**

 template<typename **Value**>

```
class fifo_entry : public hpx::util::cache::entries::entry<Value,fifo_entry<Value>>
#include <hpx/cache/entries/fifo_entry.hpp> The fifo_entry type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently inserted entries are discarded from the cache first.
```

Note: The **fifo_entry** conforms to the CacheEntry concept.

Note: This type can be used to model a ‘last in first out’ cache policy if it is used with a `std::greater` as the caches’ `UpdatePolicy` (instead of the default `std::less`).

Template Parameters Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

fifo_entry() = default

Any cache entry has to be default constructible.

```
inline explicit fifo_entry(Value const &val)
    noexcept(std::is_nothrow_constructible_v<base_type, Value
    const&>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit fifo_entry(Value &&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline constexpr bool insert()
```

The function `insert` is called by a cache whenever it is about to be inserted into the cache.

Note: This function is part of the CacheEntry concept

Returns This function should return `true` if the entry should be added to the cache, otherwise it should return `false`.

```
inline constexpr time_point const &get_creation_time() const noexcept
```

Private Types

```
using base_type = entry<Value,fifo_entry<Value>>
```

```
using time_point = std::chrono::steady_clock::time_point
```

Private Members

time_point insertion_time_

Friends

```
inline friend bool operator<(fifo_entry const &lhs, fifo_entry const &rhs)
    noexcept(noexcept(std::declval<time_point const&>() <
                      std::declval<time_point const&>()))
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been created earlier (FIFO).

hpx/cache/entries/lfu_entry.hpp

Defined in header hpx/cache/entries/lfu_entry.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

```
class lru_entry : public hpx::util::cache::entries::entry<Value, lru_entry<Value>>
#include <hpx/cache/entries/lru_entry.hpp> The lru_entry type can be used to store arbitrary values in a cache. Using this type as the cache’s entry type makes sure that the least frequently used entries are discarded from the cache first.
```

Note: The **lru_entry** conforms to the CacheEntry concept.

Note: This type can be used to model a ‘most frequently used’ cache policy if it is used with a std::greater as the caches’ UpdatePolicy (instead of the default std::less).

Template Parameters **Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

lfu_entry() = default

Any cache entry has to be default constructible.

inline explicit **lfu_entry**(*Value* const &val)
 noexcept(*std*::is_nothrow_constructible_v<*base_type*, *Value*
 const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **lfu_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline bool **touch**() noexcept

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LFU entry we store the reference count tracking the number of times this entry has been requested. This which will be used to compare the age of an entry during the invocation of the *operator<()*.

Returns This function should return true if the cache needs to update it's internal heap.

Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

inline constexpr unsigned long const &**get_access_count**() const noexcept

Private Types

using **base_type** = *entry*<*Value*, *lfu_entry*<*Value*>>

Private Members

unsigned long **ref_count_** = 0

Friends

inline friend bool **operator<**(*lfu_entry* const &lhs, *lfu_entry* const &rhs) noexcept

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been accessed less frequently (LFU).

hpx/cache/entries/lru_entry.hpp

Defined in header hpx/cache/entries/lru_entry.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

```
template<typename Value>
class lru_entry : public hpx::util::cache::entries::entry<Value, lru_entry<Value>>
#include <hpx/cache/entries/lru_entry.hpp> The lru_entry type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently used entries are discarded from the cache first.
```

Note: The **lru_entry** conforms to the CacheEntry concept.

Note: This type can be used to model a ‘most recently used’ cache policy if it is used with a `std::greater` as the caches’ `UpdatePolicy` (instead of the default `std::less`).

Template Parameters `Value` – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

Public Functions

inline `lru_entry()`

Any cache entry has to be default constructible.

inline explicit `lru_entry(Value const &val)`

```
noexcept(std::is_nothrow_constructible_v<base_type, Value>
        const&>)
```

Construct a new instance of a cache entry holding the given value.

inline explicit `lru_entry(Value &&val)` noexcept

Construct a new instance of a cache entry holding the given value.

inline bool `touch()`

The function `touch` is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LRU entry we store the time of the last access which will be used to compare the age of an entry during the invocation of the `operator<()`.

Returns This function should return true if the cache needs to update its internal heap.

Usually this is needed if the entry has been changed by `touch()` in a way influencing the sort order as mandated by the cache’s `UpdatePolicy`

inline constexpr `time_point const &get_access_time()` const noexcept

Returns the last access time of the entry.

Private Types

```
using base_type = entry<Value, lru_entry<Value>>
```

```
using time_point = std::chrono::steady_clock::time_point
```

Private Members

```
time_point access_time_
```

Friends

```
inline friend bool operator<(lru_entry const &lhs, lru_entry const &rhs)  
    noexcept(noexcept(std::declval<time_point> const& <  
        std::declval<time_point> const&>()))
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been accessed less recently (LRU).

hpx/cache/entries/size_entry.hpp

Defined in header hpx/cache/entries/size_entry.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **util**

 namespace **cache**

 namespace **entries**

 class **size_entry**

```
#include <hpx/cache/entries/size_entry.hpp> The size_entry type can be used to store values  
in a cache which have a size associated (such as files, etc.). Using this type as the cache’s entry  
type makes sure that the entries with the biggest size are discarded from the cache first.
```

Note: The **size_entry** conforms to the CacheEntry concept.

Note: This type can be used to model a ‘discard smallest first’ cache policy if it is used with a *std::greater* as the caches’ UpdatePolicy (instead of the default *std::less*).

Template Parameters

- **Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.
- **Derived** – The (optional) type for which this type is used as a base class.

Public Functions

`size_entry()` = default

Any cache entry has to be default constructible.

`inline explicit size_entry(Value const &val, std::size_t size = 0)`
`noexcept(std::is_nothrow_constructible_v<base_type, Value`
`const&>)`

Construct a new instance of a cache entry holding the given value.

`inline explicit size_entry(Value &&val, std::size_t size = 0) noexcept`
`Construct a new instance of a cache entry holding the given value.`

`inline constexpr std::size_t get_size() const noexcept`
`Return the ‘size’ of this entry.`

Private Types

`using derived_type = typename detail::size_derived<Value, Derived>::type`

`using base_type = entry<Value, derived_type>`

Private Members

`std::size_t size_ = 0`

Friends

`inline friend constexpr friend bool operator< (size_entry const &lhs,`
`size_entry const &rhs) noexcept`

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has a bigger size.

hpx/cache/statistics/local_statistics.hpp

Defined in header `hpx/cache/statistics/local_statistics.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace `hpx`

namespace `util`

namespace **cache**

 namespace **statistics**

```

inline vector(vector &&other, Allocator const &alloc)
inline vector(std::initializer_list<T> init, Allocator const &alloc)
inline ~vector()

inline vector &operator=(vector const &other)
inline vector &operator=(vector &&other) noexcept
inline allocator_type get_allocator() const noexcept
    Returns the allocator associated with the container.

inline reference operator[](size_type pos)
inline const_reference operator[](size_type pos) const
inline pointer data() noexcept
    Returns pointer to the underlying array serving as element storage. The pointer is such that range [data(); data() + size()] is always a valid range, even if the container is empty (data() is not dereference-able in that case).
inline const_pointer data() const noexcept
    Returns pointer to the underlying array serving as element storage. The pointer is such that range [data(); data() + size()] is always a valid range, even if the container is empty (data() is not dereference-able in that case).

inline T *device_data() const noexcept
    Returns a raw pointer corresponding to the address of the data allocated on the device.

inline std::size_t size() const noexcept
inline std::size_t capacity() const noexcept
inline bool empty() const noexcept
    Returns: size() == 0.

inline void resize(size_type, T const&
    Effects: If size <= size(), equivalent to calling pop_back() size() - size times. If size() < size, appends size - size copies of val to the sequence.
    Requires: T shall be CopyInsertable into *this.
    Remarks: If an exception is thrown there are no effects.

inline iterator begin() noexcept
inline iterator end() noexcept
inline const_iterator cbegin() const noexcept
inline const_iterator cend() const noexcept
inline const_iterator begin() const noexcept
inline const_iterator end() const noexcept
inline void swap(vector &other) noexcept
    Effects: Exchanges the contents and capacity() of *this with that of x.
    Complexity: Constant time.

```

```
inline void clear() noexcept
```

Effects: Erases all elements in the range [begin(),end()). Destroys all elements in ‘a’. Invalidates all references, pointers, and iterators referring to the elements of a and may invalidate the past-the-end iterator.

Post: a.empty() returns true.

Complexity: Linear.

Public Static Functions

```
static inline void resize(size_type)
```

Effects: If size <= size(), equivalent to calling pop_back() size()

- size times. If size() < size, appends size - size() default-inserted elements to the sequence.

Requires: T shall be MoveInsertable and DefaultInsertable into *this.

Remarks: If an exception is thrown other than by the move constructor of a non-CopyInsertable T there are no effects.

hpx/compute_local/host/block_fork_join_executor.hpp

Defined in header hpx/compute_local/host/block_fork_join_executor.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
namespace execution
```

```
namespace experimental
```

```
class block_fork_join_executor
```

```
#include <block_fork_join_executor.hpp> An executor with fork-join (blocking) semantics.
```

The `block_fork_join_executor` creates on construction a set of worker threads that are kept alive for the duration of the executor. Copying the executor has reference semantics, i.e. copies of a `fork_join_executor` hold a reference to the worker threads of the original instance. Scheduling work through the executor concurrently from different threads is undefined behaviour.

The executor keeps a set of worker threads alive for the lifetime of the executor, meaning other work will not be executed while the executor is busy or waiting for work. The executor has a customizable delay after which it will yield to other work. Since starting and resuming the worker

threads is a slow operation the executor should be reused whenever possible for multiple adjacent parallel algorithms or invocations of bulk_(a)sync_execute.

This behaviour is similar to the plain *fork_join_executor* except that the *block_fork_join_executor* creates a hierarchy of fork_join_executors, one for each target used to initialize it.

Public Functions

```
inline explicit block_fork_join_executor(threads::thread_priority priority =  
    threads::thread_priority::bound,  
    threads::thread_stacksize stacksize =  
    threads::thread_stacksize::small_,  
    fork_join_executor::loop_schedule const  
    schedule =  
    fork_join_executor::loop_schedule::static_,  
    std::chrono::nanoseconds yield_delay =  
    std::chrono::milliseconds(1))
```

Construct a *block_fork_join_executor*.

Note: This constructor will create one fork_join_executor for each numa domain

Parameters

- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be nostack.
- **schedule** – The loop schedule of the parallel regions.
- **yield_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

```
inline explicit block_fork_join_executor(std::vector<compute::host::target> const  
    &targets, threads::thread_priority priority =  
    threads::thread_priority::bound,  
    threads::thread_stacksize stacksize =  
    threads::thread_stacksize::small_,  
    fork_join_executor::loop_schedule const  
    schedule =  
    fork_join_executor::loop_schedule::static_,  
    std::chrono::nanoseconds yield_delay =  
    std::chrono::milliseconds(1))
```

Construct a *block_fork_join_executor*.

Note: This constructor will create one fork_join_executor for each given target

Parameters

- **targets** – The list of targets to use for thread placement
- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be nostack.
- **schedule** – The loop schedule of the parallel regions.
- **yield_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

coroutines

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/coroutines/thread_enums.hpp

Defined in header hpx/coroutines/thread_enums.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **threads**

Enums

enum class **thread_schedule_state** : *std::int8_t*

The *thread_schedule_state* enumerator encodes the current state of a *thread* instance

Values:

enumerator **unknown**

enumerator **active**

 thread is currently active (running, has resources)

enumerator **pending**

 thread is pending (ready to run, but no hardware resource available)

enumerator **suspended**

 thread has been suspended (waiting for synchronization event, but still known and under control of the thread-manager)

enumerator **depleted**

 thread has been depleted (deeply suspended, it is not known to the thread-manager)

enumerator `terminated`

thread has been stopped and may be garbage collected

enumerator `staged`

this is not a real thread state, but allows to reference staged task descriptions, which eventually will be converted into thread objects

enumerator `pending_do_not_schedule`

this is not a real thread state, but allows to create a thread in pending state without scheduling it (internal, do not use)

enumerator `pending_boost`

this is not a real thread state, but allows to suspend a thread in pending state without high priority rescheduling

enumerator `deleted`

thread has been stopped and was deleted

enum class `thread_priority` : `std::int8_t`

This enumeration lists all possible thread-priorities for HPX threads.

Values:

enumerator `unknown`**enumerator `default_`**

Will assign the priority of the task to the default (normal) priority.

enumerator `low`

Task goes onto a special low priority queue and will not be executed until all high/normal priority tasks are done, even if they are added after the low priority task.

enumerator `normal`

Task will be executed when it is taken from the normal priority queue, this is usually a first-in-first-out ordering of tasks (depending on scheduler choice). This is the default priority.

enumerator `high_recursive`

The task is a high priority task and any child tasks spawned by this task will be made high priority as well - unless they are specifically flagged as non default priority.

enumerator `boost`

Same as `thread_priority_high` except that the thread will fall back to `thread_priority_normal` if resumed after being suspended.

enumerator `high`

Task goes onto a special high priority queue and will be executed before normal/low priority tasks are taken (some schedulers modify the behavior slightly and the documentation for those should be consulted).

enumerator bound

Task goes onto a special high priority queue and will never be stolen by another thread after initial assignment. This should be used for thread placement tasks such as OpenMP type for loops.

enum class `thread_restart_state` : `std::int8_t`

The `thread_restart_state` enumerator encodes the reason why a thread is being restarted

Values:

enumerator unknown**enumerator signaled**

The thread has been signaled.

enumerator timeout

The thread has been reactivated after a timeout.

enumerator terminate

The thread needs to be terminated.

enumerator abort

The thread needs to be aborted.

enum class `thread_stacksize` : `std::int8_t`

A `thread_stacksize` references any of the possible stack-sizes for HPX threads.

Values:

enumerator unknown**enumerator small_**

use small stack size (the underscore is to work around ‘small’ being defined to char on Windows)

enumerator medium

use medium sized stack size

enumerator large

use large stack size

enumerator huge

use very large stack size

enumerator nostack

this thread does not suspend (does not need a stack)

enumerator current

use size of current thread’s stack

enumerator **default_**

use default stack size

enumerator **minimal**

use minimally stack size

enumerator **maximal**

use maximally stack size

enum class **thread_schedule_hint_mode** : *std*::int8_t

The type of hint given when creating new tasks.

Values:

enumerator **none**

A hint that leaves the choice of scheduling entirely up to the scheduler.

enumerator **thread**

A hint that tells the scheduler to prefer scheduling a task on the local thread number associated with this hint. Local thread numbers are indexed from zero. It is up to the scheduler to decide how to interpret thread numbers that are larger than the number of threads available to the scheduler. Typically thread numbers will wrap around when too large.

enumerator **numa**

A hint that tells the scheduler to prefer scheduling a task on the NUMA domain associated with this hint. NUMA domains are indexed from zero. It is up to the scheduler to decide how to interpret NUMA domain indices that are larger than the number of available NUMA domains to the scheduler. Typically indices will wrap around when too large.

enum class **thread_placement_hint** : *std*::int8_t

The type of hint given to the scheduler related to thread placement

The type of hint given to the scheduler related running a thread as a child directly in the context of the parent thread

Values:

enumerator **none**

No hint is specified. The implementation is free to chose what placement methods to use.

enumerator **depth_first**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core).

enumerator **breadth_first**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores).

enumerator `depth_first_reverse`

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core). Threads are being scheduled in reverse order.

enumerator `breadth_first_reverse`

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores). Threads are being scheduled in reverse order.

enum class `thread_sharing_hint` : `std::int8_t`

The type of hint given to the scheduler related to whether it is ok to share the invoked function object between threads

Values:

enumerator `none`

No hint is specified. The implementation is free to chose what sharing methods to use.

enumerator `do_not_share_function`

A hint that tells the scheduler to avoid sharing the given function (object) between threads.

enumerator `do_not_combine_tasks`

A hint that tells the scheduler to avoid combining tasks on the same thread. This is important for tasks that may synchronize between each other, which could lead to deadlocks if those tasks are combined running by the same thread.

enum class `thread_execution_hint` : `std::int8_t`

Values:

enumerator `none`

No hint is specified. Always run the thread in its own execution environment.

enumerator `run_as_child`

Attempt to run the thread in the execution context of the parent thread.

Functions

`std::ostream &operator<<(std::ostream &os, thread_schedule_state t)`

`char const *get_thread_state_name(thread_schedule_state state)` noexcept

Returns the name of the given state.

Get the readable string representing the name of the given `thread_state` constant.

Parameters `state` – this represents the thread state.

`std::ostream &operator<<(std::ostream &os, thread_priority t)`

```

char const *get_thread_priority_name(thread_priority priority) noexcept
    Return the thread priority name.

    Get the readable string representing the name of the given thread_priority constant.

Parameters priority – this represents the thread priority.

std::ostream &operator<<(std::ostream &os, thread_restart_state t)

char const *get_thread_state_ex_name(thread_restart_state state) noexcept
    Get the readable string representing the name of the given thread_restart_state constant.

char const *get_thread_state_name(thread_state state) noexcept
    Get the readable string representing the name of the given thread_state constant.

std::ostream &operator<<(std::ostream &os, thread_stacksize t)

char const *get_stack_size_enum_name(thread_stacksize size) noexcept
    Returns the stack size name.

    Get the readable string representing the given stack size constant.

Parameters size – this represents the stack size

constexpr bool do_not_share_function(thread_sharing_hint hint) noexcept

constexpr bool do_not_combine_tasks(thread_sharing_hint hint) noexcept

constexpr thread_sharing_hint operator|( thread_sharing_hint lhs, thread_sharing_hint rhs) noexcept

constexpr bool run_as_child(thread_execution_hint hint) noexcept

```

Variables

```

constexpr thread_execution_hint default_runs_as_child_hint = thread_execution_hint::none
    Default value to use for runs-as-child mode (if true, then futures will attempt to execute associated threads directly if they have not started running).

```

```

struct thread_schedule_hint
    #include <thread_enums.hpp> A hint given to a scheduler to guide where a task should be scheduled.

    A scheduler is free to ignore the hint, or modify the hint to suit the resources available to the scheduler.

```

Public Functions

```

inline constexpr thread_schedule_hint() noexcept
    Construct a default hint with mode thread_schedule_hint_mode::none.

inline explicit constexpr thread_schedule_hint(std::int16_t thread_hint, thread_placement_hint
    placement = thread_placement_hint::none,
    thread_execution_hint runs_as_child =
    default_runs_as_child_hint,
    thread_sharing_hint sharing =
    thread_sharing_hint::none) noexcept

```

Construct a hint with mode *thread_schedule_hint_mode*::*thread* and the given hint as the local thread number.

```
inline constexpr thread_schedule_hint(thread_schedule_hint_mode mode, std::int16_t hint,  
                                     thread_placement_hint placement =  
                                     thread_placement_hint::none, thread_execution_hint  
                                     runs_as_child = default_runs_as_child_hint,  
                                     thread_sharing_hint sharing =  
                                     thread_sharing_hint::none) noexcept
```

Construct a hint with the given mode and hint. The numerical hint is unused when the mode is *thread_schedule_hint_mode::none*.

```
inline constexpr thread_placement_hint placement_mode() const noexcept
```

```
inline void placement_mode(thread_placement_hint bits) noexcept
```

```
inline constexpr thread_sharing_hint sharing_mode() const noexcept
```

```
inline void sharing_mode(thread_sharing_hint bits) noexcept
```

```
inline constexpr thread_execution_hint runs_as_child_mode() const noexcept
```

```
inline void runs_as_child_mode(thread_execution_hint bits) noexcept
```

Public Members

std::int16_t **hint** = -1

The hint associated with the mode. The interpretation of this hint depends on the given mode.

thread_schedule_hint_mode **mode** = *thread_schedule_hint_mode::none*

The mode of the scheduling hint.

std::uint8_t **placement_mode_bits**

The mode of the desired thread placement.

std::uint8_t **sharing_mode_bits**

The mode of the desired sharing hint.

std::uint8_t **runs_as_child_mode_bits**

The thread will run as a child directly in the context of the current thread

hpx/coroutines/thread_id_type.hpp

Defined in header hpx/coroutines/thread_id_type.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

```

```
template<typename T, typename IArch, typename OArch, typename Char, typename Copyable>
T *any_cast(util::basic_any<IArch, OArch, Char, Copyable> *operand) noexcept
```

Performs type-safe access to the contained object.

Parameters **operand** – target any object

Returns If *operand* is not a null pointer, and the *typeid* of the requested *T* matches that of the contents of *operand*, a pointer to the value contained by *operand*, otherwise a null pointer.

```
T const *any_cast(util::basic_any<IArch, OArch, Char, Copyable> const *operand) noexcept
```

Performs type-safe access to the contained object.

Parameters **operand** – target any object

Returns If *operand* is not a null pointer, and the *typeid* of the requested *T* matches that of the contents of *operand*, a pointer to the value contained by *operand*, otherwise a null pointer.

```
T any_cast(util::basic_any<IArch, OArch, Char, Copyable> &operand)
```

Performs type-safe access to the contained object. Let *U* be *std::remove_cv_t<std::remove_reference_t<T>>* The program is ill-formed if *std::is_constructible_v<T, U&>* is false.

Parameters **operand** – target any object

Returns static_cast<T>(*std::any_cast<U>(&operand))

```
T const &any_cast(util::basic_any<IArch, OArch, Char, Copyable> const &operand)
```

Performs type-safe access to the contained object. Let *U* be *std::remove_cv_t<std::remove_reference_t<T>>* The program is ill-formed if *std::is_constructible_v<T, const U&>* is false.

Parameters **operand** – target any object

Returns static_cast<T>(*std::any_cast<U>(&operand))

```
struct bad_any_cast : public bad_cast
```

#include <any.hpp> Defines a type of object to be thrown by the value-returning forms of `hpx::any_cast` on failure.

Public Functions

```
inline bad_any_cast(std::type_info const &src, std::type_info const &dest)
```

Constructs a new `bad_any_cast` object with an implementation-defined null-terminated byte string which is accessible through `what()`.

```
inline char const *what() const noexcept override
```

Returns the explanatory string.

Note: Implementations are allowed but not required to override `what()`.

Returns Pointer to a null-terminated string with explanatory information. The string is suitable for conversion and display as a `std::wstring`. The pointer is guaranteed to be valid at least until the exception object from which it is obtained is destroyed, or until a non-const member function (e.g. copy assignment operator) on the exception object is called.

hpx::ignore, **hpx::tuple**, **hpx::tuple_size**, **hpx::tuple_element**, **hpx::make_tuple**, **hpx::tie**,
hpx::forward_as_tuple, **hpx::tuple_cat**, **hpx::get**

Defined in header `hpx/tuple.hpp`⁶⁹⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

⁶⁹⁸ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/tuple.hpp

Functions

```
template<typename ...Ts>
constexpr tuple<util::decay_unwrap_t<Ts>...> make_tuple(Ts&&... ts)
```

Provides compile-time indexed access to the types of the elements of the tuple.

```
template<typename ...Ts>
constexpr tuple<Ts&&...> forward_as_tuple(Ts&&... ts)
```

Constructs a tuple of references to the arguments in args suitable for forwarding as an argument to a function. The tuple has rvalue reference data members when rvalues are used as arguments, and otherwise has lvalue reference data members.

Parameters **ts** – zero or more arguments to construct the tuple from

Returns `hpx::tuple` object created as if by

`hpx::tuple<Ts&&...>(HPX_FORWARD(Ts, ts)...)`

```
template<typename ...Ts>
constexpr tuple<Ts&&...> tie(Ts&... ts)
```

Creates a tuple of lvalue references to its arguments or instances of `hpx::ignore`.

Parameters **ts** – zero or more lvalue arguments to construct the tuple from.

Returns `hpx::tuple` object containing lvalue references.

```
template<typename ...Tuples>
constexpr auto tuple_cat(Tuples&&... tuples)
```

Constructs a tuple that is a concatenation of all tuples in `tuples`. The behavior is undefined if any type in `std::decay_t<Tuples>...` is not a specialization of `hpx::tuple`. However, an implementation may choose to support types (such as `std::array` and `std::pair`) that follow the tuple-like protocol.

Parameters **tuples** -- zero or more tuples to concatenate

Returns `hpx::tuple` object composed of all elements of all argument tuples constructed from `hpx::get<Is>(HPX_FORWARD(UTuple,t))` for each individual element.

```
template<std::size_t I>
util::at_index<I, Ts...>::type &get() noexcept
```

Extracts the Ith element from the tuple. I must be an integer value in [0, `sizeof...(Ts)`).

```
template<std::size_t I>
util::at_index<I, Ts...>::type const &get() const noexcept
```

Extracts the Ith element from the tuple. I must be an integer value in [0, `sizeof...(Ts)`).

Variables

```
constexpr hpx::detail::ignore_type ignore = {}
```

An object of unspecified type such that any value can be assigned to it with no effect. Intended for use with `hpx::tie` when unpacking a `hpx::tuple`, as a placeholder for the arguments that are not used. While the behavior of `hpx::ignore` outside of `hpx::tie` is not formally specified, some code guides recommend using `hpx::ignore` to avoid warnings from unused return values of `[[nodiscard]]` functions.

```
template<typename ...Ts>
```

class tuple

#include <tuple.hpp> Class template `hpx::tuple` is a fixed-size collection of heterogeneous values. It is a generalization of `hpx::pair`. If `std::is_trivially_destructible<Ti>::value` is true for every `Ti` in `Ts`, the destructor of tuple is trivial.

Param `Ts...` the types of the elements that the tuple stores.

template<`std::size_t` `I`, typename `T`, typename `Enable` = void>

struct tuple_element

#include <tuple.hpp> Provides compile-time indexed access to the types of the elements of a tuple-like type.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

template<typename `T`>

struct tuple_size

#include <tuple.hpp> Provides access to the number of elements in a tuple-like type as a compile-time constant expression.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

hpx::any, hpx::make_any

Defined in header `hpx/any.hpp`⁶⁹⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

Defines

`HPX_ERROR_UNSCOPED_ENUM_DEPRECATED_MSG`

namespace **hpx**

Enums

enum class **error** : `std::int16_t`

Possible error conditions.

This enumeration lists all possible error conditions which can be reported from any of the API functions.

Values:

enumerator **success**

The operation was successful.

enumerator **no_success**

The operation did failed, but not in an unexpected manner.

enumerator **not_implemented**

The operation is not implemented.

enumerator **out_of_memory**

The operation caused an out of memory condition.

enumerator **bad_action_code**

enumerator **bad_component_type**

The specified component type is not known or otherwise invalid.

enumerator **network_error**

A generic network error occurred.

enumerator **version_too_new**

The version of the network representation for this object is too new.

enumerator **version_too_old**

The version of the network representation for this object is too old.

enumerator **version_unknown**

The version of the network representation for this object is unknown.

enumerator **unknown_component_address**

enumerator **duplicate_component_address**

The given global id has already been registered.

enumerator **invalid_status**

The operation was executed in an invalid status.

enumerator **bad_parameter**

One of the supplied parameters is invalid.

enumerator **internal_server_error**

enumerator **service_unavailable**

enumerator **bad_request**

enumerator **repeated_request**

enumerator **lock_error**

enumerator **duplicate_console**

There is more than one console locality.

enumerator **no_registered_console**

There is no registered console locality available.

enumerator **startup_timed_out**

enumerator **uninitialized_value**

enumerator **bad_response_type**

enumerator **deadlock**

enumerator **assertion_failure**

enumerator **null_thread_id**

Attempt to invoke an API function from a non-HPX thread.

enumerator **invalid_data**

enumerator **yield_aborted**

The yield operation was aborted.

enumerator **dynamic_link_failure**

enumerator **commandline_option_error**

One of the options given on the command line is erroneous.

enumerator **serialization_error**

There was an error during serialization of this object.

enumerator **unhandled_exception**

An unhandled exception has been caught.

enumerator **kernel_error**

The OS kernel reported an error.

enumerator **broken_task**

The task associated with this future object is not available anymore.

enumerator **task_moved**

The task associated with this future object has been moved.

enumerator **task_already_started**

The task associated with this future object has already been started.

enumerator **future_already_retrieved**

The future object has already been retrieved.

enumerator **promise_already_satisfied**

The value for this future object has already been set.

enumerator **future_does_not_support_cancellation**

The future object does not support cancellation.

enumerator **future_can_not_be_cancelled**

The future can't be canceled at this time.

enumerator **no_state**

The future object has no valid shared state.

enumerator **broken.promise**

The promise has been deleted.

enumerator **thread_resource_error**

enumerator **future_cancelled**

enumerator **thread_cancelled**

enumerator **thread_not_interruptable**

enumerator **duplicate_component_id**

The component type has already been registered.

enumerator **unknown_error**

An unknown error occurred.

enumerator **bad_plugin_type**

The specified plugin type is not known or otherwise invalid.

enumerator **filesystem_error**

The specified file does not exist or other filesystem related error.

enumerator **bad_function_call**

equivalent of std::bad_function_call

enumerator **task_canceled_exception**

parallel::task_canceled_exception

enumerator **task_block_not_active**

task_region is not active

enumerator **out_of_range**

Equivalent to std::out_of_range.

enumerator **length_error**

Equivalent to std::length_error.

enumerator **migration_needs_retry**

migration failed because of global race, retry

hpx::error_code

Defined in header `hpx/system_error.hpp`⁷⁰⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Unnamed Group

```
inline error_code make_error_code(error e, throwmode mode = throwmode::plain)
```

Returns a new `error_code` constructed from the given parameters.

```
inline error_code make_error_code(error e, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
```

```
inline error_code make_error_code(error e, char const *msg, throwmode mode = throwmode::plain)
```

Returns `error_code(e, msg, mode)`.

```
inline error_code make_error_code(error e, char const *msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
```

```
inline error_code make_error_code(error e, std::string const &msg, throwmode mode = throwmode::plain)
```

Returns `error_code(e, msg, mode)`.

```
inline error_code make_error_code(error e, std::string const &msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)
```

```
inline error_code make_error_code(std::exception_ptr const &e)
```

Functions

```
std::error_category const &get_hpx_category() noexcept
```

Returns generic HPX error category used for new errors.

```
std::error_category const &get_hpx_rethrow_category() noexcept
```

Returns generic HPX error category used for errors re-thrown after the exception has been de-serialized.

```
inline error_code make_success_code(throwmode mode = throwmode::plain)
```

Returns `error_code(hpx::error::success, "success", mode)`.

⁷⁰⁰ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/system_error.hpp

```
class error_code : public error_code
```

#include <*error_code.hpp*> A *hpx::error_code* represents an arbitrary error condition.

The class *hpx::error_code* describes an object used to hold error code values, such as those originating from the operating system or other low-level application program interfaces.

Note: Class *hpx::error_code* is an adjunct to error reporting by exception

Public Functions

inline explicit **error_code**(*throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters **mode** – The parameter **mode** specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

Throws nothing –

explicit **error_code**(*error e*, *throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter **e** holds the *hpx::error* code the new exception should encapsulate.
- **mode** – The parameter **mode** specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

Throws nothing –

error_code(*error e*, char const **func*, char const **file*, long *line*, *throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter **e** holds the *hpx::error* code the new exception should encapsulate.
- **func** – The name of the function where the error was raised.
- **file** – The file name of the code where the error was raised.
- **line** – The line number of the code line where the error was raised.
- **mode** – The parameter **mode** specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

Throws nothing –

error_code(*error e*, char const **msg*, *throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter **e** holds the *hpx::error* code the new exception should encapsulate.
- **msg** – The parameter **msg** holds the error message the new exception should encapsulate.
- **mode** – The parameter **mode** specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if mode is *plain*, this is the default) or to the category *hpx_category_rethrow* (if mode is *rethrow*).

Throws *std::bad_alloc* – (if allocation of a copy of the passed string fails).

error_code(*error e*, char const **msg*, char const **func*, char const **file*, long *line*, *throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter e holds the hpx::error code the new exception should encapsulate.
- **msg** – The parameter msg holds the error message the new exception should encapsulate.
- **func** – The name of the function where the error was raised.
- **file** – The file name of the code where the error was raised.
- **line** – The line number of the code line where the error was raised.
- **mode** – The parameter mode specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if mode is `plain`, this is the default) or to the category `hpx_category_rethrow` (if mode is `rethrow`).

Throws `std::bad_alloc` – (if allocation of a copy of the passed string fails).

error_code(error e, std::string const &msg, throwmode mode = throwmode::plain)

Construct an object of type `error_code`.

Parameters

- **e** – The parameter e holds the hpx::error code the new exception should encapsulate.
- **msg** – The parameter msg holds the error message the new exception should encapsulate.
- **mode** – The parameter mode specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if mode is `plain`, this is the default) or to the category `hpx_category_rethrow` (if mode is `rethrow`).

Throws `std::bad_alloc` – (if allocation of a copy of the passed string fails).

error_code(error e, std::string const &msg, char const *func, char const *file, long line, throwmode mode = throwmode::plain)

Construct an object of type `error_code`.

Parameters

- **e** – The parameter e holds the hpx::error code the new exception should encapsulate.
- **msg** – The parameter msg holds the error message the new exception should encapsulate.
- **func** – The name of the function where the error was raised.
- **file** – The file name of the code where the error was raised.
- **line** – The line number of the code line where the error was raised.
- **mode** – The parameter mode specifies whether the constructed `hpx::error_code` belongs to the error category `hpx_category` (if mode is `plain`, this is the default) or to the category `hpx_category_rethrow` (if mode is `rethrow`).

Throws `std::bad_alloc` – (if allocation of a copy of the passed string fails).

`std::string get_message() const`

Return a reference to the error message stored in the `hpx::error_code`.

Throws `nothing` –

`inline void clear()`

Clear this `error_code` object. The postconditions of invoking this method are.

- `value() == hpx::error::success` and `category() == hpx::get_hpx_category()`

error_code(error_code const &rhs)

Copy constructor for `error_code`

Note: This function maintains the error category of the left hand side if the right hand side is a success code.

error_code &operator=(error_code const &rhs)

Assignment operator for `error_code`

Note: This function maintains the error category of the left hand side if the right hand side is a success

code.

hpx::exception

Defined in header `hpx/exception.hpp`⁷⁰¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

TypeDefs

```
using custom_exception_info_handler_type = std::function<hpx::exception_info(std::string const&,  
std::string const&, long, std::string const&)>

using pre_exception_handler_type = std::function<void()>
```

Functions

```
void set_custom_exception_info_handler(custom_exception_info_handler_type f)
void set_pre_exception_handler(pre_exception_handler_type f)
```

⁷⁰¹ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/exception.hpp

`std::string get_error_what(exception_info const &xi)`

Return the error message of the thrown exception.

The function `hpx::get_error_what` can be used to extract the diagnostic information element representing the error message as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error()` `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The error message stored in the exception If the exception instance does not hold this information, the function will return an empty string.

`error get_error(hpx::exception const &e)`

Return the error code value of the exception thrown.

The function `hpx::get_error` can be used to extract the diagnostic information element representing the error value code as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters e – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception`, `hpx::error_code`, or `std::exception_ptr`.

Throws nothing –

Returns The error value code of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return `hpx::naming::invalid_locality_id`.

`error get_error(hpx::error_code const &e)`

`std::string get_error_function_name(hpx::exception_info const &xi)`

Return the function name from which the exception was thrown.

The function `hpx::get_error_function_name` can be used to extract the diagnostic information element representing the name of the function as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_file_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`,
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The name of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string get_error_file_name(hpx::exception_info const &xi)`

Return the (source code) file name of the function from which the exception was thrown.

The function `hpx::get_error_file_name` can be used to extract the diagnostic information element representing the name of the source file as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`,
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The name of the source file of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`long get_error_line_number(hpx::exception_info const &xi)`

Return the line number in the (source code) file of the function from which the exception was thrown.

The function `hpx::get_error_line_number` can be used to extract the diagnostic information element representing the line number as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_os_thread()`,
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws nothing –

Returns The line number of the place where the exception was thrown. If the exception instance does not hold this information, the function will return -1.

```
class bad_alloc_exception : public hpx::exception, public bad_alloc
```

Public Functions

bad_alloc_exception()

Construct a `hpx::bad_alloc_exception`.

error_code get_error_code(throwmode mode = throwmode::plain) const noexcept

The function `get_error_code()` returns a `hpx::error_code` which represents the same error condition as this `hpx::exception` instance.

Parameters `mode` – The parameter `mode` specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if mode is `throwmode::plain`, this is the default) or to the category `hpx_category_rethrow` (if mode is `rethrow`).

Public Static Functions

static inline constexpr error get_error() noexcept

The function `get_error()` returns `hpx::error::out_of_memory`

Throws nothing –

```
class exception : public system_error
```

#include <exception.hpp> A `hpx::exception` is the main exception type used by HPX to report errors.

The `hpx::exception` type is the main exception type used by HPX to report errors. Any exceptions thrown by functions in the HPX library are either of this type or of a type derived from it. This implies that it is always safe to use this type only in catch statements guarding HPX library calls.

Subclassed by `hpx::bad_alloc_exception`, `hpx::exception_list`

Public Functions

explicit exception(error e = hpx::error::success)

Construct a `hpx::exception` from a `hpx::error`.

Parameters `e` – The parameter `e` holds the `hpx::error` code the new exception should encapsulate.

explicit exception(std::system_error const &e)

Construct a `hpx::exception` from a `boost::system_error`.

explicit exception(std::error_code const &e)

Construct a `hpx::exception` from a `boost::system::error_code` (this is new for Boost V1.69). This constructor is required to compensate for the changes introduced as a resolution to LWG3162 (<https://cplusplus.github.io/LWG/issue3162>).

exception(error e, char const *msg, throwmode mode = throwmode::plain)

Construct a `hpx::exception` from a `hpx::error` and an error message.

Parameters

- **e** – The parameter `e` holds the `hpx::error` code the new exception should encapsulate.
- **msg** – The parameter `msg` holds the error message the new exception should encapsulate.
- **mode** – The parameter `mode` specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if mode is `plain`, this is the default) or to the category `hpx_category_rethrow` (if mode is `rethrow`).

exception(error e, std::string const &msg, throwmode mode = throwmode::plain)

Construct a `hpx::exception` from a `hpx::error` and an error message.

Parameters

- **e** – The parameter `e` holds the `hpx::error` code the new exception should encapsulate.
- **msg** – The parameter `msg` holds the error message the new exception should encapsulate.
- **mode** – The parameter `mode` specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if mode is `plain`, this is the default) or to the category `hpx_category_rethrow` (if mode is `rethrow`).

~exception() override

Destruct a `hpx::exception`

Throws nothing –

error get_error() const noexcept

The function `get_error()` returns the `hpx::error` code stored in the referenced instance of a `hpx::exception`. It returns the `hpx::error` code this exception instance was constructed from.

Throws nothing –

error_code get_error_code(throwmode mode = throwmode::plain) const noexcept

The function `get_error_code()` returns a `hpx::error_code` which represents the same error condition as this `hpx::exception` instance.

Parameters mode – The parameter `mode` specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if mode is `throwmode::plain`, this is the default) or to the category `hpx_category_rethrow` (if mode is `rethrow`).

struct **thread_interrupted** : public `exception`

#include <exception.hpp> A `hpx::thread_interrupted` is the exception type used by HPX to interrupt a running HPX thread.

The `hpx::thread_interrupted` type is the exception type used by HPX to interrupt a running thread.

A running thread can be interrupted by invoking the `interrupt()` member function of the corresponding `hpx::thread` object. When the interrupted thread next executes one of the specified interruption points (or if it is currently blocked whilst executing one) with interruption enabled, then a `hpx::thread_interrupted` exception will be thrown in the interrupted thread. If not caught, this will cause the execution of the interrupted thread to terminate. As with any other exception, the stack will be unwound, and destructors for objects of automatic storage duration will be executed.

If a thread wishes to avoid being interrupted, it can create an instance of `hpx::this_thread::disable_interruption`. Objects of this class disable interruption for the thread that created them on construction, and restore the interruption state to whatever it was before on destruction.

```
void f()
{
    // interruption enabled here
```

(continues on next page)

(continued from previous page)

```
{
    hpx::this_thread::disable_interruption di;
    // interruption disabled
    {
        hpx::this_thread::disable_interruption di2;
        // interruption still disabled
    } // di2 destroyed, interruption state restored
    // interruption still disabled
} // di destroyed, interruption state restored
// interruption now enabled
}
```

The effects of an instance of `hpx::this_thread::disable_interruption` can be temporarily reversed by constructing an instance of `hpx::this_thread::restore_interruption`, passing in the `hpx::this_thread::disable_interruption` object in question. This will restore the interruption state to what it was when the `hpx::this_thread::disable_interruption` object was constructed, and then disable interruption again when the `hpx::this_thread::restore_interruption` object is destroyed.

```
void g()
{
    // interruption enabled here
    {
        hpx::this_thread::disable_interruption di;
        // interruption disabled
        {
            hpx::this_thread::restore_interruption ri(di);
            // interruption now enabled
        } // ri destroyed, interruption disable again
    } // di destroyed, interruption state restored
    // interruption now enabled
}
```

At any point, the interruption state for the current thread can be queried by calling `hpx::this_thread::interruption_enabled()`.

hpx/errors/exception_fwd.hpp

Defined in header `hpx/errors/exception_fwd.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

Defines

`HPX_THROWMODE_UNSCOPED_ENUM_DEPRECATED_MSG`

namespace `hpx`

Enums

enum class `throwmode` : `std::uint8_t`

Encode error category for new `error_code`.

Values:

enumerator `plain`

enumerator `rethrow`

enumerator `lightweight`

Functions

constexpr bool `operator&(throwmode lhs, throwmode rhs)` noexcept

Variables

constexpr `throwmode plain = throwmode::plain`

constexpr `throwmode rethrow = throwmode::rethrow`

constexpr `throwmode lightweight = throwmode::lightweight`

constexpr `throwmode lightweight_rethrow = throwmode::lightweight_rethrow`

`error_code throws`

Predefined `error_code` object used as “throw on error” tag.

The predefined `hpx::error_code` object `hpx::throws` is supplied for use as a “throw on error” tag.

Functions that specify an argument in the form ‘`error_code& ec=throws`’ (with appropriate namespace qualifiers), have the following error handling semantics:

If `&ec != &throws` and an error occurred: `ec.value()` returns the implementation specific error number for the particular error that occurred and `ec.category()` returns the `error_category` for `ec.value()`.

If `&ec != &throws` and an error did not occur, `ec.clear()`.

If an error occurs and `&ec == &throws`, the function throws an exception of type `hpx::exception` or of a type derived from it. The exception's `get_errorcode()` member function returns a reference to an `hpx::error_code` object with the behavior as specified above.

`hpx/errors/exception_list.hpp`

Defined in header `hpx/errors/exception_list.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace `hpx`

```
class exception_list : public hpx::exception
```

`#include <exception_list.hpp>` The class `exception_list` is a container of `exception_ptr` objects parallel algorithms may use to communicate uncaught exceptions encountered during parallel execution to the caller of the algorithm

The type `exception_list::const_iterator` fulfills the requirements of a forward iterator.

Public Types

```
using iterator = exception_list_type::const_iterator  
bidirectional iterator
```

Public Functions

```
inline std::size_t size() const noexcept
```

The number of `exception_ptr` objects contained within the `exception_list`.

Note: Complexity: Constant time.

```
inline exception_list_type::const_iterator begin() const noexcept
```

An iterator referring to the first `exception_ptr` object contained within the `exception_list`.

```
inline exception_list_type::const_iterator end() const noexcept
```

An iterator which is the past-the-end value for the `exception_list`.

`HPX_THROW_EXCEPTION`, `HPX_THROW_BAD_ALLOC`, `HPX_THROWS_IF`

Defined in header `hpx/exception.hpp`⁷⁰².

See [Public API](#) for a list of names and headers that are part of the public HPX API.

⁷⁰² http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/exception.hpp

Defines

HPX_THROW_EXCEPTION(errcode, f, ...)

Throw a `hpx::exception` initialized from the given parameters.

The macro `HPX_THROW_EXCEPTION` can be used to throw a `hpx::exception`. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the `hpx::error` code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

```
void raise_exception()
{
    // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_EXCEPTION(hpx::error::no_success, "raise_exception",
                        "simulated error");
}
```

Example:

HPX_THROW_BAD_ALLOC(f)

Throw a `hpx::bad_alloc_exception` initialized from the given parameters.

The macro `HPX_THROW_BAD_ALLOC` can be used to throw a `hpx::exception`. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the `hpx::error` code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

```
void raise_exception()
{
    // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_BAD_ALLOC("raise_exception", "simulated error");
}
```

Example:

HPX_THROWS_IF(ec, errcode, f, ...)

Either throw a `hpx::exception` or initialize `hpx::error_code` from the given parameters.

The macro *HPX_THROWS_IF* can be used to either throw a `hpx::exception` or to initialize a `hpx::error_code` from the given parameters. If `&ec == &hpx::throws`, the semantics of this macro are equivalent to *HPX_THROW_EXCEPTION*. If `&ec != &hpx::throws`, the `hpx::error_code` instance `ec` is initialized instead.

The parameter `errcode` holds the `hpx::error_code` from which the new exception should be initialized. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

HPX_THROWS_BAD_ALLOC_IF(`ec, f`)

Either throw a `hpx::bad_alloc_exception` or `hpx::error_code` to `out_of_memory`.

The macro *HPX_THROWS_BAD_ALLOC_IF* can be used to either throw a `hpx::bad_alloc_exception` or to initialize a `hpx::error_code` to `hpx::error::out_of_memory`. If `&ec == &hpx::throws`, the semantics of this macro are equivalent to *HPX_THROW_BAD_ALLOC*. If `&ec != &hpx::throws`, the `hpx::error_code` instance `ec` is initialized instead.

namespace **hpx**

execution

See *Public API* for a list of names and headers that are part of the public *HPX API*.

hpx/execution/executors/adaptive_static_chunk_size.hpp

Defined in header `hpx/execution/executors/adaptive_static_chunk_size.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

namespace **execution**

Typedefs

`typedef hpx::execution::experimental::adaptive_static_chunk_size instead`

namespace **experimental**

struct **adaptive_static_chunk_size**

`#include <adaptive_static_chunk_size.hpp>` Loop iterations are divided into pieces of size `chunk_size` and then assigned to threads. If `chunk_size` is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note: This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

Public Functions

adaptive_static_chunk_size() = default

Construct a `adaptive_static_chunk_size` executor parameters object

Note: By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

inline explicit constexpr **adaptive_static_chunk_size**(*std::size_t* chunk_size) noexcept

Construct a `adaptive_static_chunk_size` executor parameters object

Parameters `chunk_size` – [in] The optional chunk size to use as the number of loop iterations to run on a single thread.

`hpx::execution::experimental::auto_chunk_size`

Defined in header `hpx/execution.hpp`⁷⁰³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **auto_chunk_size**

#include <`auto_chunk_size.hpp`> Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

Public Functions

inline explicit constexpr **auto_chunk_size**(*std::uint64_t* num_iters_for_timing = 0) noexcept

Construct an `auto_chunk_size` executor parameters object

Note: Default constructed `auto_chunk_size` executor parameter types will use 80 microseconds as the minimal time for which any of the scheduled chunks should run.

inline explicit **auto_chunk_size**(*hpx::chrono::steady_duration* const &*rel_time*, *std::uint64_t* num_iters_for_timing = 0) noexcept

Construct an `auto_chunk_size` executor parameters object

Parameters

⁷⁰³ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/execution.hpp

- **rel_time** – [in] The time duration to use as the minimum to decide how many loop iterations should be combined.
- **num_iters_for_timing** – [in] The number of iterations to use for the timing operation

hpx/execution/executors/default_parameters.hpp

Defined in header hpx/execution/executors/default_parameters.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **execution**

 namespace **experimental**

 struct **default_parameters**

```
#include <default_parameters.hpp> Loop iterations are divided into pieces of size chunk_size
and then assigned to threads. If chunk_size is not specified, the iterations are evenly (if possible)
divided contiguously among the threads.
```

Note: This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

Public Functions

default_parameters() = default

Construct a **default_parameters** executor parameters object

Note: By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

hpx::execution::experimental::dynamic_chunk_size

Defined in header hpx/execution.hpp⁷⁰⁴.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **execution**

⁷⁰⁴ http://github.com/STEllAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/execution.hpp

namespace **experimental**

struct **dynamic_chunk_size**

`#include <dynamic_chunk_size.hpp>` Loop iterations are divided into pieces of size *chunk_size* and then dynamically scheduled among the threads; when a thread finishes one chunk, it is dynamically assigned another. If *chunk_size* is not specified, the default chunk size is 1.

Note: This executor parameters type is equivalent to OpenMP's DYNAMIC scheduling directive.

Public Functions

dynamic_chunk_size() = default

Construct an `dynamic_chunk_size` executor parameters object

Note: Default constructed `dynamic_chunk_size` executor parameter types will use a chunk size of '1'.

inline explicit constexpr **dynamic_chunk_size**(`std::size_t` *chunk_size*) noexcept

Construct a `dynamic_chunk_size` executor parameters object

Parameters **chunk_size** – [in] The optional chunk size to use as the number of loop iterations to schedule together. The default chunk size is 1.

hpx/execution/executors/execution.hpp

Defined in header `hpx/execution/executors/execution.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **parallel**

namespace **execution**

hpx/execution/executors/execution_information.hpp

Defined in header `hpx/execution/executors/execution_information.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **execution**

namespace **experimental**

Variables

`hpx::execution::experimental::has_pending_closures_t has_pending_closures`

`hpx::execution::experimental::get_pu_mask_t get_pu_mask`

`hpx::execution::experimental::set_scheduler_mode_t set_scheduler_mode`

```
struct get_pu_mask_t : public hpx::functional::detail::tag_fallback<get_pu_mask_t>
    #include <execution_information.hpp> Retrieve the bitmask describing the processing units the
    given thread is allowed to run on
    All threads::executors invoke sched.get_pu_mask().
```

Note: If the executor does not support this operation, this call will always invoke `hpx::threads::get_pu_mask()`

Param exec [in] The executor object to use for querying the number of pending tasks.

Param topo [in] The topology object to use to extract the requested information.

Param tstream_num [in] The sequence number of the thread to retrieve information for.

Private Functions

```
template<typename Executor>
inline decltype(auto) friend tagFallback_invoke(get_pu_mask_t, Executor&&,  

                                                threads::topology &topo, std::size_t  

                                                thread_num)
```

```
template<typename Executor>
inline decltype(auto) friend tag_invoke(get_pu_mask_t, Executor &&exec, threads::topology  

                                         &topo, std::size_t thread_num)
```

```
struct has_pending_closures_t : public
hpx::functional::detail::tag_fallback<has_pending_closures_t>
    #include <execution_information.hpp> Retrieve whether this executor has operations pending or
    not.
```

Note: If the executor does not expose this information, this call will always return `false`

Param exec [in] The executor object to use to extract the requested information for.

Private Functions

```
template<typename Executor>
inline decltype(auto) friend tagFallbackInvoke(hasPendingClosures_t, Executor&&)

template<typename Executor>
inline decltype(auto) friend tagInvoke(hasPendingClosures_t, Executor &&exec)

struct setSchedulerMode_t : public
    hpx::functional::detail::tagFallback<setSchedulerMode_t>

#include <execution_information.hpp> Set various modes of operation on the scheduler underneath the given executor.
```

Note: This calls exec.set_scheduler_mode(mode) if it exists; otherwise it does nothing.

Param exec [in] The executor object to use.

Param mode [in] The new mode for the scheduler to pick up

Friends

```

struct reset_thread_distribution_t : public
hpx::functional::detail::tag_priority<reset_thread_distribution_t>
#include <execution_parameters_fwd.hpp> Reset the internal round robin thread distribution
scheme for the given executor.
```

Note: This calls params.reset_thread_distribution(exec) if it exists; otherwise it does nothing.

Param params [in] The executor parameters object to use for resetting the thread distribution scheme.
Param exec [in] The executor object to use.

Private Functions

```
template<typename Parameters, typename Executor>
inline decltype(auto) friend tagFallbackInvoke(reset_thread_distribution_t, Parameters
    &&params, Executor &&exec)

struct with_processing_units_count_t : public
hpx::functional::detail::tag_priority<with_processing_units_count_t>
#include <execution_parameters_fwd.hpp> Generate a policy that supports setting the number of
cores for execution.
```

hpx::execution::experimental::guided_chunk_size

Defined in header `hpx/execution.hpp`⁷⁰⁵.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

 namespace **execution**

 namespace **experimental**

 struct **guided_chunk_size**

```
#include <guided_chunk_size.hpp> Iterations are dynamically assigned to threads in blocks as
threads request those until no blocks remain to be assigned. Similar to dynamic_chunk_size except
that the block size decreases each time a number of loop iterations is given to a thread. The size of
the initial block is proportional to number_of_iterations / number_of_cores. Subsequent blocks
are proportional to number_of_iterations_remaining / number_of_cores. The optional chunk size
parameter defines the minimum block size. The default chunk size is 1.
```

Note: This executor parameters type is equivalent to OpenMP's GUIDED scheduling directive.

Public Functions

guided_chunk_size() = default

Construct an `dynamic_chunk_size` executor parameters object

Note: Default constructed `dynamic_chunk_size` executor parameter types will use a chunk size
of '1'.

inline explicit constexpr **guided_chunk_size**(`std::size_t` min_chunk_size) noexcept

Construct a `guided_chunk_size` executor parameters object

Parameters `min_chunk_size` – [in] The optional minimal chunk size to use as the min-
imal number of loop iterations to schedule together. The default minimal chunk size is
1.

hpx::execution::experimental::num_cores

Defined in header `hpx/execution.hpp`⁷⁰⁶.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

⁷⁰⁵ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/execution.hpp

⁷⁰⁶ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/execution.hpp

namespace **execution**

namespace **experimental**

struct **num_cores**

#include <num_cores.hpp> Control number of cores in executors which need a functionality for setting the number of cores to be used by an algorithm directly

Public Functions

inline explicit constexpr **num_cores**(*std::size_t* cores = 1) noexcept
Construct a **num_cores** executor parameters object

Note: make sure the minimal number of cores is and the maximum number of cores is what's available to HPX

hpx::execution::experimental::persistent_auto_chunk_size

Defined in header [hpx/execution.hpp](#)⁷⁰⁷.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **persistent_auto_chunk_size**

#include <persistent_auto_chunk_size.hpp> Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

⁷⁰⁷ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/execution.hpp

Public Functions

```
inline explicit constexpr persistent_auto_chunk_size(std::uint64_t num_iters_for_timing = 0) noexcept
```

Construct an `persistent_auto_chunk_size` executor parameters object

Note: Default constructed `persistent_auto_chunk_size` executor parameter types will use 0 microseconds as the execution time for each chunk and 80 microseconds as the minimal time for which any of the scheduled chunks should run.

```
inline explicit persistent_auto_chunk_size(hpx::chrono::steady_duration const &time_cs, std::uint64_t num_iters_for_timing = 0) noexcept
```

Construct an `persistent_auto_chunk_size` executor parameters object

Parameters

- **time_cs** – The execution time for each chunk.
- **num_iters_for_timing** – [in] The number of iterations to use for measuring the execution time of one iteration

```
inline persistent_auto_chunk_size(hpx::chrono::steady_duration const &time_cs, hpx::chrono::steady_duration const &rel_time, std::uint64_t num_iters_for_timing = 0) noexcept
```

Construct an `persistent_auto_chunk_size` executor parameters object

Parameters

- **rel_time** – [in] The time duration to use as the minimum to decide how many loop iterations should be combined.
- **time_cs** – The execution time for each chunk.
- **num_iters_for_timing** – [in] The number of iterations to use for measuring the execution time of one iteration

`hpx/execution/executors/polymorphic_executor.hpp`

execution category of Executor shall not be weaker than that of ExecutionPolicy.
```

Public Types

```
using type = typename policy_type::template rebind<executor_type, parameters_type>::type

The type of the rebound execution policy.
```

hpx::execution::experimental::static_chunk_size

Defined in header *hpx/execution.hpp*⁷⁰⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **execution**

 namespace **experimental**

⁷⁰⁸ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/execution.hpp

struct static_chunk_size

`#include <static_chunk_size.hpp>` Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note: This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

Public Functions

static_chunk_size() = default

Construct a `static_chunk_size` executor parameters object

Note: By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

inline explicit constexpr static_chunk_size(*std::size_t* chunk_size) noexcept

Construct a `static_chunk_size` executor parameters object

Parameters `chunk_size` – [in] The optional chunk size to use as the number of loop iterations to run on a single thread.

[hpx/execution/traits/is_execution_policy.hpp](#)

Defined in header `hpx/execution/traits/is_execution_policy.hpp`.

execution_base

See *Public API* for a list of names and headers that are part of the public *HPX API*.

hpx/execution_base/execution.hpp

Defined in header `hpx/execution_base/execution.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

namespace **execution**

struct parallel_execution_tag

`#include <execution.hpp>` Function invocations executed by a group of parallel execution agents execute in unordered fashion. Any such invocations executing in the same thread are indeterminately sequenced with respect to each other.

Note: `parallel_execution_tag` is weaker than `sequenced_execution_tag`.

struct sequenced_execution_tag

`#include <execution.hpp>` Function invocations executed by a group of sequential execution agents execute in sequential order.

struct unsequenced_execution_tag

`#include <execution.hpp>` Function invocations executed by a group of vector execution agents are permitted to execute in unordered fashion when executed in different threads, and un-sequenced with respect to one another when executed in the same thread.

Note: `unsequenced_execution_tag` is weaker than `parallel_execution_tag`.

namespace **parallel**

namespace **execution**

Variables

`hpx::parallel::execution::sync_execute_t sync_execute`

`hpx::parallel::execution::async_execute_t async_execute`

`hpx::parallel::execution::then_execute_t then_execute`

`hpx::parallel::execution::post_t post`

`hpx::parallel::execution::bulk_sync_execute_t bulk_sync_execute`

`hpx::parallel::execution::bulk_async_execute_t bulk_async_execute`

`hpx::parallel::execution::bulk_then_execute_t bulk_then_execute`

`hpx::parallel::execution::async_invoke_t async_invoke`

`hpx::parallel::execution::sync_invoke_t sync_invoke`

struct `async_execute_t` : public `hpx::functional::detail::tag_fallback<async_execute_t>`

#include <execution.hpp> Customization point for asynchronous execution agent creation.

This asynchronously creates a single function invocation f() using the associated executor.

Note: Executors have to implement only `async_execute()`. All other functions will be emulated by this or other customization points in terms of this single basic primitive. However, some executors will naturally specialize all operations for maximum efficiency.

Note: This is valid for one way executors (calls `make_ready_future(exec.sync_execute(f, ts...))` if it exists) and for two way executors (calls `exec.async_execute(f, ts...)` if it exists).

Param exec [in] The executor object to use for scheduling of the function *f*.

Param f [in] The function which will be scheduled using the given executor.

Param ts [in] Additional arguments to use to invoke *f*.

Return *f(ts...)*'s result through a future

Private Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(async_execute_t, Executor &&exec, F
&&f, Ts&&... ts)
```

```
struct async_invoke_t : public hpx::functional::detail::tag_fallback<async_invoke_t>
#include <execution.hpp> Asynchronously invoke the given set of nullary functions, each on its
own execution agent
```

This creates a group of function invocations whose ordering is given by the execution_category associated with the executor.

All exceptions thrown by invocations of the functions are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This calls exec.async_invoke(fs...) if it exists; otherwise it executes async_execute(fs) for each fs.

Param exec [in] The executor object to use for scheduling of the functions *fs*.

Param fs [in] The functions which will be scheduled using the given executor.

Return The return type of *executor_type*::*async_invoke* if defined by *executor_type*. Otherwise a future<void> representing finishing the execution of all functions *fs*.

Private Functions

```
template<typename Executor, typename F, typename ...Fs>
inline decltype(auto) friend tag_fallback_invoke(async_invoke_t, Executor &&exec, F
&&f, Fs&&... fs)
```

```
struct bulk_async_execute_t : public
hpx::functional::detail::tag_fallback<bulk_async_execute_t>
#include <execution.hpp> Bulk form of asynchronous execution agent creation.
```

This asynchronously creates a group of function invocations *f(i)* whose ordering is given by the execution_category associated with the executor.

Here *i* takes on all values in the index space implied by shape. All exceptions thrown by invocations of *f(i)* are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This is deliberately different from the bulk_async_execute customization points specified in P0443. The bulk_async_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

Note: This calls exec.bulk_async_execute(f, shape, ts...) if it exists; otherwise it executes async_execute(f, shape, ts...) as often as needed.

Param exec [in] The executor object to use for scheduling of the function *f*.

Param f [in] The function which will be scheduled using the given executor.
Param shape [in] The shape objects which defines the iteration boundaries for the arguments to be passed to *f*.
Param ts [in] Additional arguments to use to invoke *f*.
Return The return type of *executor_type::bulk_async_execute* if defined by *executor_type*. Otherwise a vector of futures holding the returned values of each invocation of *f*.

Private Functions

```
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_async_execute_t, Executor &&exec,
F &&f, Shape const &shape, Ts&&... ts)
```

```
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_async_execute_t tag, Executor
&&exec, F &&f, Shape const &shape,
Ts&&... ts)
```

```
struct bulk_sync_execute_t : public hpx::functional::detail::tag_fallback<bulk_sync_execute_t>
#include <execution.hpp> Bulk form of synchronous execution agent creation.
```

This synchronously creates a group of function invocations *f(i)* whose ordering is given by the *execution_category* associated with the executor. The function synchronizes the execution of all scheduled functions with the caller.

Here *i* takes on all values in the index space implied by *shape*. All exceptions thrown by invocations of *f(i)* are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This is deliberately different from the *bulk_sync_execute* customization points specified in P0443. The *bulk_sync_execute* customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

Note: This calls *exec.bulk_sync_execute(f, shape, ts...)* if it exists; otherwise it executes *sync_execute(f, shape, ts...)* as often as needed.

Param exec [in] The executor object to use for scheduling of the function *f*.
Param f [in] The function which will be scheduled using the given executor.
Param shape [in] The shape objects which defines the iteration boundaries for the arguments to be passed to *f*.
Param ts [in] Additional arguments to use to invoke *f*.
Return The return type of *executor_type::bulk_sync_execute* if defined by *executor_type*. Otherwise a vector holding the returned values of each invocation of *f* except when *f* returns void, which case void is returned.

Private Functions

```
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_sync_execute_t, Executor &&exec,
                                                F &&f, Shape const &shape, Ts&&... ts)
```

```
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(bulk_sync_execute_t tag, Executor
                                                &&exec, F &&f, Shape const &shape,
                                                Ts&&... ts)
```

```
struct bulk_then_execute_t : public hpx::functional::detail::tag_fallback<bulk_then_execute_t>
#include <execution.hpp> Bulk form of execution agent creation depending on a given future.
```

This creates a group of function invocations $f(i)$ whose ordering is given by the execution_category associated with the executor.

Here i takes on all values in the index space implied by shape. All exceptions thrown by invocations of $f(i)$ are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This is deliberately different from the then_sync_execute customization points specified in P0443. The bulk_then_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

Note: This calls exec.bulk_then_execute(f, shape, pred, ts...) if it exists; otherwise it executes sync_execute(f, shape, pred.share(), ts...) (if this executor is also an OneWayExecutor), or async_execute(f, shape, pred.share(), ts...) (if this executor is also a TwoWayExecutor) - as often as needed.

Param exec [in] The executor object to use for scheduling of the function f .

Param f [in] The function which will be scheduled using the given executor.

Param shape [in] The shape objects which defines the iteration boundaries for the arguments to be passed to f .

Param predecessor [in] The future object the execution of the given function depends on.

Param ts [in] Additional arguments to use to invoke f .

Return The return type of $executor_type::bulk_then_execute$ if defined by $executor_type$.

Otherwise a vector holding the returned values of each invocation of f .

Private Functions

```
template<typename Executor, typename F, typename Shape, typename Future, typename ...Ts>
```

```
inline decltype(auto) friend tag_fallback_invoke(bulk_then_execute_t, Executor &&exec,
                                                F &&f, Shape const &shape, Future
                                                &&predecessor, Ts&&... ts)
```

```
template<typename Executor, typename F, typename Shape, typename Future, typename ...Ts>
```

```
inline decltype(auto) friend tag_fallback_invoke(bulk_then_execute_t tag, Executor
&&exec, F &&f, Shape const &shape,
Future &&predecessor, Ts&&... ts)
```

```
struct post_t : public hpx::functional::detail::tag_fallback<post_t>
#include <execution.hpp> Customization point for asynchronous fire & forget execution agent
creation.
```

This asynchronously (fire & forget) creates a single function invocation *f()* using the associated executor.

Note: This is valid for two way executors (calls *exec.post(f, ts...)*, if available, otherwise it calls *exec.async_execute(f, ts...)* while discarding the returned future), and for non-blocking two way executors (calls *exec.post(f, ts...)* if it exists).

Param exec [in] The executor object to use for scheduling of the function *f*.

Param f [in] The function which will be scheduled using the given executor.

Param ts [in] Additional arguments to use to invoke *f*.

Private Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(post_t, Executor &&exec, F &&f,
Ts&&... ts)
```

```
struct sync_execute_t : public hpx::functional::detail::tag_fallback<sync_execute_t>
#include <execution.hpp> Customization point for synchronous execution agent creation.
```

This synchronously creates a single function invocation *f()* using the associated executor. The execution of the supplied function synchronizes with the caller

Note: It will call *tag_invoke(sync_execute_t, exec, f, ts...)* if it exists. For two-way executors it will invoke *asynch_execute_t* and wait for the task's completion before returning.

Param exec [in] The executor object to use for scheduling of the function *f*.

Param f [in] The function which will be scheduled using the given executor.

Param ts [in] Additional arguments to use to invoke *f*.

Return *f(ts...)*'s result

Private Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(sync_execute_t, Executor &&exec, F
&&f, Ts&&... ts)
```

```
struct sync_invoke_t : public hpx::functional::detail::tag_fallback<sync_invoke_t>
```

#include <execution.hpp> Synchronously invoke the given set of nullary functions, each on its own execution agent

This creates a group of function invocations whose ordering is given by the execution_category associated with the executor.

All exceptions thrown by invocations of the functions are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This calls exec.sync_invoke(fs...) if it exists; otherwise it executes sync_execute(fs) for each fs.

Param exec [in] The executor object to use for scheduling of the functions *fs*.

Param fs [in] The functions which will be scheduled using the given executor.

Return The return type of *executor_type::async_invoke* if defined by *executor_type*.

Private Functions

```
template<typename Executor, typename F, typename ...Fs>
inline decltype(auto) friend tag_fallback_invoke(sync_invoke_t, Executor &&exec, F &&f,
                                              Fs&&... fs)
```

```
struct then_execute_t : public hpx::functional::detail::tag_fallback<then_execute_t>
#include <execution.hpp> Customization point for execution agent creation depending on a given
future.
```

This creates a single function invocation f() using the associated executor after the given future object has become ready.

Note: This is valid for two way executors (calls exec.then_execute(f, predecessor, ts...)) if it exists) and for one way executors (calls predecessor.then(bind(f, ts...))).

Param exec [in] The executor object to use for scheduling of the function *f*.

Param f [in] The function which will be scheduled using the given executor.

Param predecessor [in] The future object the execution of the given function depends on.

Param ts [in] Additional arguments to use to invoke *f*.

Return *f(ts...)*'s result through a future

Private Functions

```
template<typename Executor, typename F, typename Future, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(then_execute_t, Executor &&exec, F
                                              &&f, Future &&predecessor, Ts&&... ts)
```

hpx/execution_base/receiver.hpp

Defined in header hpx/execution_base/receiver.hpp.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

 namespace **execution**

 namespace **experimental**

Functions

```
template<typename R, typename ...As>
void set_value(R &&r, As&&... as)
```

set_value is a customization point object. The expression `hpx::execution::set_value(r, as...)` is equivalent to:

- `r.set_value(as...)`, if that expression is valid. If the function selected does not send the value(s) as... to the Receiver r's value channel, the program is ill-formed (no diagnostic required).
- Otherwise, ``set_value(r, as...)`, if that expression is valid, with overload resolution performed in a context that include the declaration `void set_value();`
- Otherwise, the expression is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`.

```
template<typename R>
void set_stopped(R &&r)
```

set_stopped is a customization point object. The expression `hpx::execution::set_stopped(r)` is equivalent to:

- `r.set_stopped()`, if that expression is valid. If the function selected does not signal the Receiver r's done channel, the program is ill-formed (no diagnostic required).
- Otherwise, ``set_stopped(r)`, if that expression is valid, with overload resolution performed in a context that include the declaration `void set_stopped();`
- Otherwise, the expression is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`.

```
template<typename R, typename E>
void set_error(R &&r, E &&e)
```

set_error is a customization point object. The expression `hpx::execution::set_error(r, e)` is equivalent to:

- `r.set_stopped(e)`, if that expression is valid. If the function selected does not send the error e the Receiver r's error channel, the program is ill-formed (no diagnostic required).
- Otherwise, ``set_error(r, e)`, if that expression is valid, with overload resolution performed in a context that include the declaration `void set_error();`
- Otherwise, the expression is ill-formed.

The customization is implemented in terms of `hpx::functional::tag_invoke`.

Variables

```
hpx::execution::experimental::set_value_t set_value

hpx::execution::experimental::set_error_t set_error

hpx::execution::experimental::set_stopped_t set_stopped

template<typename T, typename E = std::exception_ptr>
constexpr bool is_receiver_v = is_receiver<T, E>::value

template<typename T, typename CS>
constexpr bool is_receiver_of_v = is_receiver_of<T, CS>::value

template<typename T, typename CS>
constexpr bool is_nothrow_receiver_of_v = is_nothrow_receiver_of<T, CS>::value

template<typename T, typename CS>
struct is_nothrow_receiver_of : public
hpx::execution::experimental::detail::is_nothrow_receiver_of_impl<is_receiver_v<T> &&
is_receiver_of_v<T, CS>, T, CS>

template<typename T, typename E>
struct is_receiver

#include <receiver.hpp> Receiving values from asynchronous computations is handled by the Receiver concept. A Receiver needs to be able to receive an error or be marked as being canceled. As such, the Receiver concept is defined by having the following two customization points defined, which form the completion-signal operations:

- hpx::execution::experimental::set_stopped*hpx::execution::experimental::set_error

Those two functions denote the completion-signal operations. The Receiver contract is as follows:

- None of a Receiver's completion-signal operation shall be invoked before hpx::execution::experimental::start has been called on the operation state object that was returned by connecting a Receiver to a sender hpx::execution::experimental::connect.
- Once hpx::execution::start has been called on the operation state object, exactly one of the Receiver's completion-signal operation shall complete without an exception before the Receiver is destroyed

Once one of the Receiver's completion-signal operation has been completed without throwing an exception, the Receiver contract has been satisfied. In other words: The asynchronous operation has been completed.
```

See also:

hpx::execution::experimental::is_receiver_of

template<typename T, typename CS>

struct **is_receiver_of**

#include <receiver.hpp> The *receiver_of* concept is a refinement of the Receiver concept by requiring one additional completion-signal operation:

- `hpx::execution::set_value`

The `receiver_of` concept takes a receiver and an instance of the `completion_signatures<>` class template. The `receiver_of` concept, rather than accepting a receiver and some value types, is changed to take a receiver and an instance of the `completion_signatures<>` class template. A sender uses `completion_signatures<>` to describe the signals with which it completes. The `receiver_of` concept ensures that a particular receiver is capable of receiving those signals.

This completion-signal operation adds the following to the Receiver's contract:

- If `hpx::execution::set_value` exits with an exception, it is still valid to call `hpx::execution::set_error` or `hpx::execution::set_stopped`

TypeDefs

typedef *hpx::execution::parallel_executor* instead

namespace **this_thread**

Functions

hpx::execution::parallel_executor get_executor(error_code &ec = throws)

Returns a reference to the executor that was used to create the current thread.

Throws If – &ec != &throws, never throws, but will set ec to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

namespace **threads**

Functions

hpx::execution::parallel_executor get_executor(thread_id_type const &id, error_code &ec = throws)

Returns a reference to the executor that was used to create the given thread.

Throws If – &ec != &throws, never throws, but will set ec to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*.  namespace **execution**

Typedefs

```
using sequenced_task_policy = detail::sequenced_task_policy_shim<sequenced_executor,  
hpx::traits::executor_parameters_type_t<sequenced_executor>>
```

Extension: The class `sequenced_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may not be parallelized (has to run sequentially).

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the `sequenced_policy`.

```
using sequenced_policy = detail::sequenced_policy_shim<sequenced_executor,  
hpx::traits::executor_parameters_type_t<sequenced_executor>>
```

The class `sequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm's execution may not be parallelized.

```
using parallel_task_policy = detail::parallel_task_policy_shim<parallel_executor,  
hpx::traits::executor_parameters_type_t<parallel_executor>>
```

Extension: The class `parallel_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the `parallel_policy`.

```
using parallel_policy = detail::parallel_policy_shim<parallel_executor,  
hpx::traits::executor_parameters_type_t<parallel_executor>>
```

The class `parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

```
using parallel_unsequenced_task_policy =  
detail::parallel_unsequenced_task_policy_shim<parallel_executor,  
hpx::traits::executor_parameters_type_t<parallel_executor>>
```

The class `parallel_unsequenced_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

⁷⁰⁹ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/execution.hpp

```
using parallel_unsequenced_policy =
detail::parallel_unsequenced_policy_shim<parallel_executor,
hpx::traits::executor_parameters_type_t<parallel_executor>>
```

The class `parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

```
using unsequenced_task_policy = detail::unsequenced_task_policy_shim<sequenced_executor,
hpx::traits::executor_parameters_type_t<sequenced_executor>>
```

The class `unsequenced_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be vectorized.

```
using unsequenced_policy = detail::unsequenced_policy_shim<sequenced_executor,
hpx::traits::executor_parameters_type_t<sequenced_executor>>
```

The class `unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be vectorized.

```

```
template<typename Policy>
```

```
struct parallel_policy_executor
```

```
#include <parallel_executor.hpp> A parallel_executor creates groups of parallel execution agents
which execute in threads implicitly created by the executor. This executor prefers continuing with the
creating thread first before executing newly created threads.
```

This executor conforms to the concepts of a TwoWayExecutor, and a BulkTwoWayExecutor

Public Types

```
using execution_category = std::conditional_t<std::is_same_v<Policy, launch::sync_policy>,
sequenced_execution_tag, parallel_execution_tag
```

Associate the *parallel_execution_tag* executor tag type as a default with this executor, except if the given launch policy is synch.

```
using executor_parameters_type = experimental::default_parameters
```

Associate the *default_parameters* executor parameters type as a default with this executor.

Public Functions

```

inline explicit constexpr parallel_policy_executor(threads::thread_priority priority,
                                                 threads::thread_stacksize stacksize =

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/executors/datapar/execution_policy_mappings.hpp

Defined in header `hpx/executors/datapar/execution_policy_mappings.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

filesystem

See *Public API* for a list of names and headers that are part of the public *HPX API*.

hpx/modules/filesystem.hpp

Defined in header `hpx/modules/filesystem.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

This file provides a compatibility layer using Boost.Filesystem for the C++17 filesystem library. It is *not* intended to be a complete compatibility layer. It only contains functions required by the HPX codebase. It also provides some functions only available in Boost.Filesystem when using C++17 filesystem.

namespace **hpx**

namespace **filesystem**

Functions

```
inline path initial_path()
inline std::string basename(path const &p)
inline path canonical(path const &p, path const &base)
inline path canonical(path const &p, path const &base, std::error_code &ec)
```

namespace **filesystem**

functional

See *Public API* for a list of names and headers that are part of the public *HPX API*.

hpx::bind, hpx::placeholders::_1, hpx::placeholders::_2, ..., hpx::placeholders::_9

Defined in header `hpx/functional.hpp`⁷¹⁰.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Top level namespace.

⁷¹⁰ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/functional.hpp

Functions

```
template<typename F, typename ...Ts, typename Enable =  
    std::enable_if_t<!traits::is_action_v<std::decay_t<F>>>>  
constexpr detail::bound<std::decay_t<F>, util::make_index_pack_t<sizeof...(Ts)>, util::decay_unwrap_t<Ts>...> bind(F  
    &&f,  
    Ts&&...  
    vs)
```

The function template *bind* generates a forwarding call wrapper for *f*. Calling this wrapper is equivalent to invoking *f* with some of its arguments bound to *vs*.

Parameters

- **f** – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- **vs** – list of arguments to bind, with the unbound arguments replaced by the placeholders *_1, _2, _3...* of namespace `hpx::placeholders`

Returns A function object of unspecified type *T*, for which

```
hpx::is_bind_expression<T>::value == true.
```

namespace `placeholders`

The `hpx::placeholders` namespace contains the placeholder objects *[_1, ..., _N]* where *N* is an implementation defined maximum number.

When used as an argument in a `hpx::bind` expression, the placeholder objects are stored in the generated function object, and when that function object is invoked with unbound arguments, each placeholder *_N* is replaced by the corresponding *N*th unbound argument.

The types of the placeholder objects are `DefaultConstructible` and `CopyConstructible`, their default copy/move constructors do not throw exceptions, and for any placeholder *_N*, the type `hpx::is_placeholder<decltype(_N)>` is defined, where `hpx::is_placeholder<decltype(_N)>` is derived from `std::integral_constant<int, N>`.

Variables

```
constexpr detail::placeholder<1> _1 = {}
```

```
constexpr detail::placeholder<2> _2 = {}
```

```
constexpr detail::placeholder<3> _3 = {}
```

```
constexpr detail::placeholder<4> _4 = {}
```

```
constexpr detail::placeholder<5> _5 = {}
```

```
constexpr detail::placeholder<6> _6 = {}
```

```
constexpr detail::placeholder<7> _7 = { }

constexpr detail::placeholder<8> _8 = { }

constexpr detail::placeholder<9> _9 = { }

namespace serialization
```

Functions

```
template<typename Archive, typename F, typename ...Ts>
void serialize(Archive &ar, ::hpx::detail::bound<F, Ts...> &bound, unsigned int const version = 0)

template<typename Archive, std::size_t I>
constexpr void serialize(Archive&, ::hpx::detail::placeholder<I>&, unsigned int const = 0) noexcept
```

```
namespace util
```

Functions

```
template<typename F, typename... Ts> HPX_DEPRECATED_V (1, 8,
"hpx::util::bind is deprecated,
use hpx::bind instead") const expr decltype(auto) bind(F &&f
```

Variables

```
Ts && ts {return hpx::bind(HPX_FORWARD(F, f), HPX_FORWARD(Ts, ts)...)
```

```
namespace placeholders
```

Functions

```

```

hpx::bind_back

Defined in header `hpx/functional.hpp`⁷¹¹.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level namespace.

Functions

```
template<typename F, typename ...Ts>  
constexpr hpx::detail::bound_back<std::decay_t<F>, util::make_index_pack_t<sizeof...(Ts)>, util::decay_unwrap_t<Ts>...> bind
```

Function templates `bind_back` generate a forwarding call wrapper for `f`. Calling this wrapper is equivalent to invoking `f` with its last `sizeof...(Ts)` parameters bound to `vs`.

Parameters

- **f** – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- **vs** – list of the arguments to bind to the last `sizeof...(Ts)` parameters of `f`

Returns A function object of type `T` that is unspecified, except that the types of objects returned by two calls to `hpx::bind_back` with the same arguments are the same.

```
template<typename F>  
constexpr std::decay_t<F> bind_back(F &&f)
```

namespace **serialization**

⁷¹¹ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/functional.hpp

Functions

```
template<typename Archive, typename F, typename ...Ts>
void serialize(Archive &ar, ::hpx::detail::bound_back<F, Ts...> &bound, unsigned int const version =
0)
```

namespace **util**

Functions

```
template<typename F, typename... Ts> HPX_DEPRECATED_V (1, 8,
"hpz::util::bind_back is deprecated,
use hpz::bind_back instead") const expr decltype(auto) bind_back(F &&f
```

hpx::bind_front

Defined in header `hpx/functional.hpp`⁷¹².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level namespace.

Functions

```
template<typename F, typename ...Ts>
constexpr detail::bound_front<std::decay_t<F>, util::make_index_pack_t<sizeof...(Ts)>, util::decay_unwrap_t<Ts>...> bind_fro
```

Function template `bind_front` generates a forwarding call wrapper for `f`. Calling this wrapper is equivalent to invoking `f` with its first `sizeof...(Ts)` parameters bound to `vs`.

Parameters

- **f** – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- **vs** – list of the arguments to bind to the first or `sizeof...(Ts)` parameters of `f`

Returns A function object of type `T` that is unspecified, except that the types of objects returned by two calls to `hpx::bind_front` with the same arguments are the same.

```
template<typename F>
constexpr std::decay_t<F> bind_front(F &&f)
```

namespace **serialization**

⁷¹² http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/functional.hpp

Functions

```
template<typename Archive, typename F, typename ...Ts>

namespace **hpx**

Top level namespace.

```
template<typename Sig, bool Serializable = false>
```

class **function**

```
#include <function.hpp> Class template hpx::function is a general-purpose polymorphic function wrapper. Instances of hpx::function can store, copy, and invoke any CopyConstructible Callable target &#8212; functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to data members. The stored callable object is called the target of hpx::function. If an hpx::function contains no target, it is called empty. Invoking the target of an empty hpx::function results in hpx::error::bad_function_call exception being thrown. hpx::function satisfies the requirements of CopyConstructible and CopyAssignable.
```

hpx::function_ref

Defined in header `hpx/functional.hpp`⁷¹⁴.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 Top level namespace.

```
template<typename Sig>
```

```
class function_ref
```

`#include <function_ref.hpp>` `function_ref` class is a vocabulary type with reference semantics for passing entities to call.

An example use case that benefits from higher-order functions is `retry(n, f)` which attempts to call `f` up to `n` times synchronously until success. This example might model the real-world scenario of repeatedly querying a flaky web service.

```
using payload = std::optional< /* ... */ >;  
// Repeatedly invokes `action` up to `times` repetitions.  
// Immediately returns if `action` returns a valid `payload`.  
// Returns `std::nullopt` otherwise.  
payload retry(size_t times, /* ???? */ action);
```

The passed-in action should be a callable entity that takes no arguments and returns a payload. This can be done with function pointers, `hpx::function` or a template but it is much simpler with `function_ref` as seen below:

```
payload retry(size_t times, function_ref<payload()> action);
```

```
template<typename R, typename ...Ts>
```

```
class function_ref<R(Ts...)>
```

Public Functions

```
template<typename F, typename FD = std::decay_t<F>, typename Enable =

hpx::invoke

Defined in header `hpx/functional.hpp`⁷¹⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

⁷¹⁵ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/functional.hpp

Defines

`HPX_INVOKE_R(R, F, ...)`

namespace **hpx**

Top level namespace.

Functions

```
template<typename F, typename ...Ts>
constexpr util::invoke_result_t<F, Ts&&...> invoke(F &&f, Ts&&... vs)
    noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F,
        f), HPX_FORWARD(Ts, vs)...)))
```

Invokes the given callable object f with the content of the argument pack vs

Note: This function is similar to `std::invoke` (C++17)

Parameters

- **f** – Requires to be a callable object. If f is a member function pointer, the first argument in the pack will be treated as the callee (this object).
- **vs** – An arbitrary pack of arguments

Throws `std::exception` – like objects thrown by call to object f with the argument types vs.

Returns The result of the callable object when it's called with the given argument types.

```
template<typename R, typename F, typename ...Ts>
constexpr R invoke_r(F &&f, Ts&&... vs) noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F, f),
    HPX_FORWARD(Ts, vs)...)))
```

Invokes the given callable object f with the content of the argument pack vs

Note: This function is similar to `std::invoke` (C++17)

Parameters

- **f** – Requires to be a callable object. If f is a member function pointer, the first argument in the pack will be treated as the callee (this object).
- **vs** – An arbitrary pack of arguments

Throws `std::exception` – like objects thrown by call to object f with the argument types vs.

Template Parameters **R** – The result type of the function when it's called with the content of the given argument types vs.

Returns The result of the callable object when it's called with the given argument types.

namespace **functional**

struct **invoke**

Public Functions

```
template<typename F, typename ...Ts>
inline constexpr util::invoke_result_t<F, Ts&&...> operator()(F &&f, Ts&&... vs) const noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F, f), HPX_FORWARD(Ts, vs)...)))
```

```
template<typename R>
struct invoke_r
```

Public Functions

```
template<typename F, typename ...Ts>
inline constexpr R operator()(F &&f, Ts&&... vs) const noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F, f), HPX_FORWARD(Ts, vs)...)))
```

hpx::invoke_fused, hpx::invoke_fused_r

Defined in header `hpx/functional.hpp`⁷¹⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level namespace.

Functions

```
template<typename F, typename Tuple>
constexpr detail::invoke_fused_result_t<F, Tuple> invoke_fused(F &&f, Tuple &&t) noexcept(noexcept(detail::invoke_fused_impl(detail::fused_index::HPX_FORWARD(F, f), HPX_FORWARD(Tuple, t)))))
```

Invokes the given callable object f with the content of the sequenced type t (tuples, pairs).

Note: This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

Parameters

- **f** – Must be a callable object. If f is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to `hpx::get`.

Throws `std::exception` – like objects thrown by call to object f with the arguments contained in the sequenceable type t.

⁷¹⁶ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/functional.hpp

Returns The result of the callable object when it's called with the content of the given sequenced type.

```
template<typename R, typename F, typename Tuple>
constexpr R invoke_fused_r(F &&f, Tuple &&t) noexcept
    noexcept(noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple>{}, HPX_FORWARD(F, f), HPX_FORWARD(Tuple, t))))
```

Invokes the given callable object f with the content of the sequenced type t (tuples, pairs).

Note: This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

Note: The difference between `hpx::invoke_fused` and `hpx::invoke_fused_r` is that the later allows to specify the return type as well.

Parameters

- **f** – Must be a callable object. If f is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to `hpx::get`.

Throws `std::exception` – like objects thrown by call to object f with the arguments contained in the sequenceable type t.

Template Parameters **R** – The result type of the function when it's called with the content of the given sequenced type.

Returns The result of the callable object when it's called with the content of the given sequenced type.

hpx::mem_fn

Defined in header `hpx/functional.hpp`⁷¹⁷.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level namespace.

⁷¹⁷ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/functional.hpp

Functions

```
template<typename M, typename C>
constexpr detail::mem_fn<M C::*> mem_fn(M C::* pm) noexcept
```

Function template `hpx::mem_fn` generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a `hpx::mem_fn`.

Parameters `pm` – pointer to member that will be wrapped

Returns a call wrapper of unspecified type with the following member:

```
template <typename... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type
operator()(Ts&&... vs) noexcept;
```

Let `fn` be the call wrapper returned by a call to `hpx::mem_fn` with a pointer to member `pm`. Then the expression `fn(t,a2,...,aN)` is equivalent to `HPX_INVOKE(pm,t,a2,...,aN)`. Thus, the return type of `operator()` is `std::result_of<decltype(pm)(Ts&&...)>::type` or equivalently `std::invoke_result_t<decltype(pm), Ts&&...>`, and the value in `noexcept` specifier is equal to `std::is_nothrow_invocable_v<decltype(pm), Ts&&...>`. Each argument in `vs` is perfectly forwarded, as if by `std::forward<Ts>(vs)...`.

```
template<typename R, typename C, typename ...Ps>
constexpr detail::mem_fn<R (C::*)(Ps...)> mem_fn(R (C::* pm)(Ps...)) noexcept
```

Function template `hpx::mem_fn` generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a `hpx::mem_fn`.

Parameters `pm` – pointer to member that will be wrapped

Returns a call wrapper of unspecified type with the following member:

```
template <typename... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type
operator()(Ts&&... vs) noexcept;
```

Let `fn` be the call wrapper returned by a call to `hpx::mem_fn` with a pointer to member `pm`. Then the expression `fn(t,a2,...,aN)` is equivalent to `HPX_INVOKE(pm,t,a2,...,aN)`. Thus, the return type of `operator()` is `std::result_of<decltype(pm)(Ts&&...)>::type` or equivalently `std::invoke_result_t<decltype(pm), Ts&&...>`, and the value in `noexcept` specifier is equal to `std::is_nothrow_invocable_v<decltype(pm), Ts&&...>`. Each argument in `vs` is perfectly forwarded, as if by `std::forward<Ts>(vs)...`.

```
template<typename R, typename C, typename ...Ps>
constexpr detail::mem_fn<R (C::*)(Ps...) const> mem_fn(R (C::* pm)(Ps...)) const noexcept
```

Function template `hpx::mem_fn` generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a `hpx::mem_fn`.

Parameters `pm` – pointer to member that will be wrapped

Returns a call wrapper of unspecified type with the following member:

```
template <typename... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type
operator()(Ts&&... vs) noexcept;
```

Let `fn` be the call wrapper returned by a call to `hpx::mem_fn` with a pointer to member `pm`. Then the expression `fn(t,a2,...,aN)` is equivalent to `HPX_INVOKE(pm,t,a2,...,aN)`. Thus, the return type of `operator()` is `std::result_of<decltype(pm)(Ts&&...)>::type` or equivalently `std::invoke_result_t<decltype(pm), Ts&&...>`, and the value in `noexcept` specifier is equal to `std::is_nothrow_invocable_v<decltype(pm), Ts&&...>`. Each argument in `vs` is perfectly forwarded, as if by `std::forward<Ts>(vs)` .

hpx::move_only_function

Defined in header `hpx/functional.hpp`⁷¹⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

Defines

```
HPX_UTIL_REGISTER_UNIQUE_FUNCTION_DECLARATION(Sig, F, Name)
```

```
HPX_UTIL_REGISTER_UNIQUE_FUNCTION(Sig, F, Name)
```

namespace `hpx`

Top level namespace.

```
template<typename Sig, bool Serializable = false>
```

```
class move_only_function
```

#include <move_only_function.hpp> Class template `hpx::move_only_function` is a general-purpose polymorphic function wrapper. `hpx::move_only_function` objects can store and invoke any constructible (not required to be move constructible) Callable target ; functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to member objects.

The stored callable object is called the target of `hpx::move_only_function`. If an `hpx::move_only_function` contains no target, it is called empty. Unlike `hpx::function`, invoking an empty `hpx::move_only_function` results in undefined behavior.

`hpx::move_only_functions` supports every possible combination of cv-qualifiers, ref-qualifiers, and noexcept-specifiers not including volatile provided in its template parameter. These qualifiers and specifier (if any) are added to its operator(). `hpx::move_only_function` satisfies the requirements of MoveConstructible and MoveAssignable, but does not satisfy CopyConstructible or CopyAssignable.

```
template<typename R, typename ...Ts, bool Serializable>
```

```
class move_only_function<R(Ts...), Serializable> : public util::detail::basic_function<R(Ts...), false,
Serializable>
```

⁷¹⁸ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/functional.hpp

hpx::experimental::scope_exit

Defined in header `hpx/experimental/scope.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Top level namespace.

namespace **experimental**

Functions

```
template<typename F>
auto scope_exit(F &&f)
```

The class template `scope_exit` is a general-purpose scope guard intended to call its exit function when a scope is exited.

Template Parameters `F` – type of stored exit function

Parameters `f` – stored exit function

hpx::experimental::scope_fail

Defined in header `hpx/experimental/scope.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Top level namespace.

namespace **experimental**

Functions

```
template<typename F>
auto scope_fail(F &&f)
```

The class template scope_fail is a general-purpose scope guard intended to call its exit function when a scope is exited via an exception.

Template Parameters **F** – type of stored exit function

Parameters **f** – stored exit function

hpx::experimental::scope_success

Defined in header `hpx/experimental/scope.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 Top level namespace.

 namespace **experimental**

Functions

```
template<typename F>
auto scope_success(F &&f)
```

The class template scope_success is a general-purpose scope guard intended to call its exit function when a scope is normally exited.

Template Parameters **F** – type of stored exit function

Parameters **f** – stored exit function

hpx::is_bind_expression

Defined in header `hpx/functional.hpp`⁷²⁰.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

    #include <is_bind_expression.hpp> If T is the type produced by a call to hpx::bind, this template is
    derived from std::true_type. For any other type, this template is derived from std::false_type.
    This template may be specialized for a user-defined type T to implement UnaryTypeTrait with base characteristic of std::true_type to indicate that T should be treated by hpx::bind as if it were the type of a bind subexpression: when a bind-generated function object is invoked, a bound argument of this type will be invoked as a function object and will be given all the unbound arguments passed to the bind-generated object.

    Subclassed by hpx::is_bind_expression< T const >

    template<typename T>
    struct is_bind_expression<T const> : public hpx::is_bind_expression<T>

    namespace traits
```

Typedefs

```
typedef hpx::is_bind_expression<T> instead
```

Functions

```
template<typename T> HPX_DEPRECATED_V (1, 8,
    "hpx::traits::is_bind_expression_v is deprecated,
     use \"hpx::is_bind_expression_v instead\") inline const expr bool is_bind_expression_v
```

hpx::is_placeholder

Defined in header *hpx/functional.hpp*⁷²¹.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Top level namespace.

```
template<typename T>
```

⁷²¹ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/functional.hpp

struct `is_placeholder`

`#include <is_placeholder.hpp>` If T is a standard, Boost, or HPX placeholder (_1, _2, _3, ...) then this template is derived from `std::integral_constant<int,1>`, `std::integral_constant<int,2>`, `std::integral_constant<int,3>`, respectively. Otherwise, it is derived from `std::integral_constant<int,0>`.

The template may be specialized for any user-defined T type: the specialization must satisfy *UnaryTypeTrait* with base characteristic of `std::integral_constant<int,N>` with N>0 to indicate that T should be treated as N'th placeholder type. `hpx::bind` uses `hpx::is_placeholder` to detect placeholders for unbound arguments.

namespace **traits**

Functions

```
template<typename T> HPX_DEPRECATED_V (1, 8,
"hpx::traits::is_placeholder_v is deprecated,
use \"hpx::is_placeholder_v instead\") inline const expr bool is_placeholder_v
```

futures

See *Public API* for a list of names and headers that are part of the public *HPX API*.

`hpx::future`, `hpx::shared_future`, `hpx::make_future`, `hpx::make_shared_future`,
`hpx::make_ready_future`, `hpx::make_ready_future_alloc`, `hpx::make_ready_future_at`,
`hpx::make_ready_future_after`, `hpx::make_exceptional_future`

Defined in header `hpx/future.hpp`⁷²².

See *Public API* for a list of names and headers that are part of the public *HPX API*.

Defines

`HPX_MAKE_EXCEPTIONAL_FUTURE`(T, errorcode, f, msg)

namespace **hpx**

Top level HPX namespace.

⁷²² <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

Functions

```
template<typename R, typename U>
hpx::future<R> make_future(hpx::future<U> &&f)
```

Converts any future of type U to any other future of type R based on an existing conversion path from U to R.

```
template<typename R, typename U, typename Conv>
hpx::future<R> make_future(hpx::future<U> &&f, Conv &&conv)
```

Converts any future of type U to any other future of type R based on a given conversion function: R conv(U).

```
template<typename R, typename U>
hpx::future<R> make_future(hpx::shared_future<U> f)
```

Converts any *shared_future* of type U to any other future of type R based on an existing conversion path from U to R.

```
template<typename R, typename U, typename Conv>
hpx::future<R> make_future(hpx::shared_future<U> f, Conv &&conv)
```

Converts any future of type U to any other future of type R based on an existing conversion path from U to R.

```
template<typename R>
hpx::shared_future<R> make_shared_future(hpx::future<R> &&f) noexcept
```

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

```
template<typename R>
hpx::shared_future<R> &make_shared_future(hpx::shared_future<R> &f) noexcept
```

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

```
template<typename R>
hpx::shared_future<R> &&make_shared_future(hpx::shared_future<R> &&f) noexcept
```

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

```
template<typename R>
hpx::shared_future<R> const &make_shared_future(hpx::shared_future<R> const &f) noexcept
```

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

```
template<typename T, typename Allocator, typename ...Ts>
std::enable_if_t<std::is_constructible_v<T, Ts&&...> || std::is_void_v<T>, future<T>> make_ready_future_alloc(Allocator
```

```
const
&a,
Ts&&...
ts)
```

Creates a pre-initialized future object with allocator (extension)

```
template<typename T, typename ...Ts>
```

```
std::enable_if_t<std::is_constructible_v<T, Ts&&...> || std::is_void_v<T>, future<T>> make_ready_future(Ts&&...
ts)
```

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, valid() == true and is_ready() == true.

```
template<int DeductionGuard = 0, typename Allocator, typename T>
future<hpx::util::decay_unwrap_t<T>> make_ready_future_alloc(Allocator const &a, T &&init)
```

```
template<int DeductionGuard = 0, typename T>
```

`future<hpx::util::decay_unwrap_t<T>> make_ready_future(T &&init)`

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, `valid() == true` and `is_ready() == true`.

`template<typename T>`

`future<T> make_exceptional_future(std::exception_ptr const &e)`

Creates a pre-initialized future object which holds the given error (extension)

`template<typename T, typename E>`

`future<T> make_exceptional_future(E e)`

Creates a pre-initialized future object which holds the given error (extension)

`template<int DeductionGuard = 0, typename T>`

`future<hpx::util::decay_unwrap_t<T>> make_ready_future_at(hpx::chrono::steady_time_point const &abs_time, T &&init)`

Creates a pre-initialized future object which gets ready at a given point in time (extension)

`template<int DeductionGuard = 0, typename T>`

`future<hpx::util::decay_unwrap_t<T>> make_ready_future_after(hpx::chrono::steady_duration const &rel_time, T &&init)`

Creates a pre-initialized future object which gets ready after a given point in time (extension)

`template<typename Allocator>`

`inline future<void> make_ready_future_alloc(Allocator const &a)`

`future<void> make_ready_future()`

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, `valid() == true` and `is_ready() == true`.

`inline future<void> make_ready_future_at(hpx::chrono::steady_time_point const &abs_time)`

Creates a pre-initialized future object which gets ready at a given point in time (extension)

`inline future<void> make_ready_future_after(hpx::chrono::steady_duration const &rel_time)`

Creates a pre-initialized future object which gets ready after a given point in time (extension)

`template<typename R>`

`class future : public hpx::lcos::detail::future_base<future<R>, R>`

`#include <future_fwd.hpp>` The class template `hpx::future` provides a mechanism to access the result of asynchronous operations:

- An asynchronous operation (created via `hpx::async`, `hpx::packaged_task`, or `hpx::promise`) can provide a `hpx::future` object to the creator of that asynchronous operation.
- The creator of the asynchronous operation can then use a variety of methods to query, wait for, or extract a value from the `hpx::future`. These methods may block if the asynchronous operation has not yet provided a value.
- When the asynchronous operation is ready to send a result to the creator, it can do so by modifying shared state (e.g. `hpx::promise::set_value`) that is linked to the creator's `hpx::future`. Note that `hpx::future` references shared state that is not shared with any other asynchronous return objects (as opposed to `hpx::shared_future`).

Public Types

```
using result_type = R

using shared_state_type = typename base_type::shared_state_type
```

Public Functions

```
constexpr future() noexcept = default

future(future &&other) noexcept = default

future(future const &other) noexcept = delete

inline future(future<future> &&other) noexcept

inline future(future<shared_future<R>> &&other) noexcept

template<typename T>
inline future(future<T> &&other, std::enable_if_t<std::is_void_v<R> && !traits::is_future_v<TT* = nullptr) noexcept

~future() = default

future &operator=(future &&other) noexcept = default

future &operator=(future const &other) noexcept = delete

inline shared_future<R> share() noexcept

inline hpx::traits::future_traits<future>::result_type get()

inline hpx::traits::future_traits<future>::result_type get(error_code &ec)

template<typename F>
inline decltype(auto) then(F &&f, error_code &ec = throws)
```

Attaches a continuation to *this*. The behavior is undefined if *this* has no associated shared state (i.e., *valid() == false*).

In cases where *decltype(func(*this))* is *future<R>*, the resulting type is *future<R>* instead of *future<future<R>>*. Effects:

- The continuation is called when the object's shared state is ready (has a value or exception stored).
- The continuation launches according to the specified launch policy or executor.
- When the executor or launch policy is not provided the continuation inherits the parent's launch policy or executor.
- If the parent was created with *std::promise* or with a *packaged_task* (has no associated launch policy), the continuation behaves the same as the third overload with a policy argument of *launch::async | launch::deferred* and the same argument for *func*.
- If the parent has a policy of *launch::deferred* and the continuation does not have a specified launch policy or scheduler, then the parent is filled by immediately calling *.wait()*, and the policy of the antecedent is *launch::deferred*

Note: Postcondition:

- The future object is moved to the parameter of the continuation function.
- *valid() == false* on original future object immediately after it returns.

Template Parameters

- **F** – The type of the function/function object to use (deduced). F must meet requirements of *MoveConstructible*.
- **error_code** – The type of error code.

Parameters

- **f** – A continuation to be attached.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns An object of type *future<decltype(func(*this))>* that refers to the shared state created by the continuation.

```
template<typename T0, typename F>
inline decltype(auto) then(T0 &&t0, F &&f, error_code &ec = throws)
```

Attaches a continuation to **this*. The behavior is undefined if **this* has no associated shared state (i.e., *valid() == false*). \copydetail *hpx::future::then(F&& f, error_code& ec = throws)*

Note: Postcondition:

- The future object is moved to the parameter of the continuation function.
 - *valid() == false* on original future object immediately after it returns.
-

Template Parameters

- **T0** – The type of executor or launch policy.
- **F** – The type of the function/function object to use (deduced). F must meet requirements of *MoveConstructible*.
- **error_code** – The type of error code.

Parameters

- **t0** – The executor or launch policy to be used.
- **f** – A continuation to be attached.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns An object of type *future<decltype(func(*this))>* that refers to the shared state created by the continuation.

```
template<typename Allocator, typename F>
inline auto then_alloc(Allocator const &alloc, F &&f, error_code &ec = throws) ->
    decltype(base_type::then_alloc(alloc, HPX_MOVE(*this),
        HPX_FORWARD(F, f), ec))
```

```

```
template<typename R>
```

```
class shared_future : public hpx::lcos::detail::future_base<shared_future<R>, R>
```

#include <future_fwd.hpp> The class template *hpx::shared_future* provides a mechanism to access the result of asynchronous operations, similar to *hpx::future*, except that multiple threads are allowed to wait for the same shared state. Unlike *hpx::future*, which is only moveable (so only one instance can refer to any particular asynchronous result), *hpx::shared_future* is copyable and multiple shared future objects may refer to the same shared state. Access to the same shared state from multiple threads is safe if each thread does it through its own copy of a *shared_future* object.

Public Types

hpx::packaged_task

Defined in header *hpx/future.hpp*⁷²³.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

template<typename **Sig**, typename **Allocator**>

```
struct uses_allocator<hpx::packaged_task<Sig>, Allocator> : public true_type
```

namespace **hpx**

Top level HPX namespace.

template<typename **Sig**>

class **packaged_task**

#include <packaged_task.hpp> The class template *hpx::packaged_task* wraps any Callable` target (function, lambda expression, bind expression, or another function object) so that it can be invoked asynchronously. Its return value or exception thrown is stored in a shared state which can be accessed through *hpx::future* objects. Just like *hpx::function*, *hpx::packaged_task* is a polymorphic, allocator-aware container: the stored callable target may be allocated on heap or with a provided allocator.

template<typename **R**, typename ...**Ts**>

```
template<typename R, typename Allocator>

struct uses_allocator<hpx::promise<R>, Allocator> : public true_type
```

namespace **hpx**

Top level HPX namespace.

template<typename R>

class **promise** : public `hpx::detail::promise_base<R>`

`#include <promise.hpp>` The class template `hpx::promise` provides a facility to store a value or an exception that is later acquired asynchronously via a `hpx::future` object created by the `hpx::promise` object. Note that the `hpx::promise` object is meant to be used only once. Each promise is associated with a shared state, which contains some state information and a result which may be not yet evaluated, evaluated to a value (possibly void) or evaluated to an exception. A promise may do three things with the shared state:

- make ready: the promise stores the result or the exception in the shared state. Marks the state ready and unblocks any thread waiting on a future associated with the shared state.
- release: the promise gives up its reference to the shared state. If this was the last such reference, the shared state is destroyed. Unless this was a shared state created by `hpx::async` which is not yet ready, this operation does not block.
- abandon: the promise stores the exception of type `hpx::future_error` with error code `hpx::error::broken_promise`, makes the shared state ready, and then releases it. The promise is the “push” end of the promise-future communication channel: the operation that stores a value in the shared state synchronizes-with (as defined in `hpx::memory_order`) the successful return from any function that is waiting on the shared state (such as `hpx::future::get`). Concurrent access to the same shared state may conflict otherwise: for example multiple callers of `hpx::shared_future::get` must either all be read-only or provide external synchronization.

⁷²⁴ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

io_service

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/io_service/io_service_pool.hpp

Defined in header hpx/io_service/io_service_pool.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

class **io_service_pool**

#include <io_service_pool.hpp> A pool of io_service objects.

Public Functions

HPX_NON_COPYABLE(*io_service_pool*)

explicit **io_service_pool**(*std::size_t* pool_size = 2, *threads::policies::callback_notifier* const ¬ifier = *threads::policies::callback_notifier()*, *char const *pool_name* = "", *char const *name_postfix* = "")

Construct the io_service pool.

Parameters

- **pool_size** – [in] The number of threads to run to serve incoming requests
- **notifier** – [in]
- **pool_name** – [in]
- **name_postfix** – [in]

explicit **io_service_pool**(*threads::policies::callback_notifier* const ¬ifier, *char const *pool_name* = "", *char const *name_postfix* = "")

Construct the io_service pool.

Parameters

- **notifier** – [in]
- **pool_name** – [in]
- **name_postfix** – [in]

~io_service_pool()

bool **run**(bool join_threads = true, *barrier* *startup = nullptr)

Run all io_service objects in the pool. If join_threads is true this will also wait for all threads to complete

bool **run**(*std::size_t* num_threads, bool join_threads = true, *barrier* *startup = nullptr)

Run all io_service objects in the pool. If join_threads is true this will also wait for all threads to complete

void stop()

Stop all io_service objects in the pool.

```
void join()  
    Join all io_service threads in the pool.  
void clear()  
    Clear all internal data structures.  
void wait()  
    Wait for all work to be done.  
bool stopped()  
  
asio::io_context &get_io_service(int index = -1)  
    Get an io_service to use.  
std::thread &get_os_thread_handle(std::size_t thread_num)  
    access underlying thread handle  
inline constexpr std::size_t size() const noexcept  
    Get number of threads associated with this I/O service.  
void thread_run(std::size_t index, barrier *startup = nullptr) const  
    Activate the thread index for this thread pool.  
inline constexpr char const *get_name() const noexcept  
    Return name of this pool.  
void init(std::size_t pool_size)
```

Protected Functions

```
bool run_locked(std::size_t num_threads, bool join_threads, barrier *startup)  
void stop_locked()  
void join_locked()  
void clear_locked()  
void wait_locked()
```

Private Types

```
using io_service_ptr = std::unique_ptr<asio::io_context>
```

```
using work_type = std::unique_ptr<asio::io_context::work>
```

Private Members

`std::mutex mtx_`

`std::vector<io_service_ptr> io_services_`

The pool of io_services.

`std::vector<std::thread> threads_`

`std::vector<work_type> work_`

The work that keeps the io_services running.

`std::size_t next_io_service_`

The next io_service to use for a connection.

`bool stopped_`

set to true if stopped

`std::size_t pool_size_`

initial number of OS threads to execute in this pool

`threads::policies::callback_notifier const ¬ifier_`

call this for each thread start/stop

`char const *pool_name_`

`char const *pool_name_postfix_`

`bool waiting_`

Set to true if waiting for work to finish.

`std::unique_ptr<barrier> wait_barrier_`

`std::unique_ptr<barrier> continue_barrier_`

Private Static Functions

static inline `work_type initialize_work(asio::io_context &io_service)`

lcos_local

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/lcos_local/trigger.hpp

Defined in header `hpx/lcos_local/trigger.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **lcos**

 namespace **local**

pack_traversal

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx/pack_traversal/pack_traversal.hpp

Defined in header hpx/pack_traversal/pack_traversal.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

Functions

```
template<typename Mapper, typename... T> <unspecified> map_pack (Mapper &&mapper, T &&... pack)
```

Maps the pack with the given mapper.

This function tries to visit all plain elements which may be wrapped in:

- homogeneous containers (`std::vector`, `std::list`)
- heterogeneous containers (`hpx::tuple`, `std::pair`, `std::array`) and re-assembles the pack with the result of the mapper. Mapping from one type to a different one is supported.

Elements that aren't accepted by the mapper are routed through and preserved through the hierarchy.

```
// Maps all integers to floats
map_pack([](int value) {
    return float(value);
},
1, hpx::make_tuple(2, std::vector<int>{3, 4}), 5);
```

Throws `std::exception` – like objects which are thrown by an invocation to the mapper.

Parameters

- **mapper** – A callable object, which accept an arbitrary type and maps it to another type or the same one.
- **pack** – An arbitrary variadic pack which may contain any type.

Returns The mapped element or in case the pack contains multiple elements, the pack is wrapped into a `hpx::tuple`.

hpx/pack_traversal/pack_traversal_async.hpp

Defined in header `hpx/pack_traversal/pack_traversal_async.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

Functions

```
template<typename Visitor, typename ...T>
auto traverse_pack_async(Visitor &&visitor, T &&... pack) ->
    decltype(detail::apply_pack_transform_async(HPX_FORWARD(Visitor,
visitor), HPX_FORWARD(T, pack)...))
```

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```

// The synchronous overload is called for each object, // it may
return false to suspend the current control. // In that case the
overload below is called. template <typename T> bool
operator()(async_traverse_visit_tag, T&& element) {
    return true;
}

// The asynchronous overload this is called when the // 
synchronous overload returned false. // In addition to the
current visited element the overload is // called with a
continuation callable object which resumes the // traversal when
it's called later. // The continuation next may be stored and
called later or // dropped completely to abort the traversal
early. template <typename T, typename N> void
operator()(async_traverse_detach_tag, T&& element, N&& next) { }

// The overload is called when the traversal was finished. // As
argument the whole pack is passed over which we // traversed
asynchronously. template <typename T> void
operator()(async_traverse_complete_tag, T&& pack) { }
};
```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

Parameters

- **visitor** – A visitor object which provides the three `operator()` overloads that were described above. Additionally the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.

Returns A `hpx::intrusive_ptr` that references an instance of the given visitor object.

`hpx::functional::unwrap, hpx::functional::unwrap_n, hpx::functional::unwrap_all, hpx::unwrap,`
`hpx::unwrap_n, hpx::unwrap_all, hpx::unwrapping, hpx::unwrapping_n, hpx::unwrapping_all`

Defined in header `hpx/unwrap.hpp`⁷²⁵.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

⁷²⁵ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/unwrap.hpp

Functions

```
template<typename ...Args>
auto unwrap(Args&&... args) -> decltype(util::detail::unwrap_depth_impl<1U>(HPX_FORWARD(Args,
    args)...))
```

A helper function for retrieving the actual result of any hpx::future like type which is wrapped in an arbitrary way.

Unwraps the given pack of arguments, so that any hpx::future object is replaced by its future result type in the argument pack:

- `hpx::future<int> -> int`
- `hpx::future<std::vector<float>> -> std::vector<float>`
- `std::vector<future<float>> -> std::vector<float>`

The function is capable of unwrapping hpx::future like objects that are wrapped inside any container or tuple like type, see `hpx::util::map_pack()` for a detailed description about which surrounding types are supported. Non hpx::future like types are permitted as arguments and passed through.

```
hpx::unwrap(hpx::make_ready_future(0));

// Multiple arguments hpx::tuple<int, int> i2 =
    hpx::unwrap(hpx::make_ready_future(1),
                hpx::make_ready_future(2));
```

Note: This function unwraps the given arguments until the first traversed nested hpx::future which corresponds to an unwrapping depth of one. See `hpx::unwrap_n()` for a function which unwraps the given arguments to a particular depth or `hpx::unwrap_all()` that unwraps all future like objects recursively which are contained in the arguments.

Parameters `args` – the arguments that are unwrapped which may contain any arbitrary future or non future type.

Throws `std::exception` – like objects in case any of the given wrapped hpx::future objects were resolved through an exception. See `hpx::future::get()` for details.

Returns Depending on the count of arguments this function returns a `hpx::tuple` containing the unwrapped arguments if multiple arguments are given. In case the function is called with a single argument, the argument is unwrapped and returned.

```
template<std::size_t Depth, typename ...Args>
auto unwrap_n(Args&&... args) ->
    decltype(util::detail::unwrap_depth_impl<Depth>(HPX_FORWARD(Args, args)...))
```

An alterntive version of `hpx::unwrap()`, which unwraps the given arguments to a certain depth of hpx::future like objects.

See `unwrap` for a detailed description.

Template Parameters `Depth` – The count of hpx::future like objects which are unwrapped maximally.

```
template<typename ...Args>
auto unwrap_all(Args&&... args) ->
    decltype(util::detail::unwrap_depth_impl<0U>(HPX_FORWARD(Args, args...)))
```

An alterntive version of hpx::unwrap(), which unwraps the given arguments recursively so that all contained hpx::future like objects are replaced by their actual value.

See hpx::unwrap() for a detailed description.

```
template<typename T>
auto unwrapping(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<1U>(HPX_FORWARD(T, callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap() function and then passes the result to the given callable object.

```
return left + right;  
});  
  
int i1 = callable(hpx::make_ready_future(1),  
                  hpx::make_ready_future(2));
```

See hpx::unwrap() for a detailed description.

Parameters **callable** – the callable object which which is called with the result of the corresponding unwrap function.

```
template<std::size_t Depth, typename T>
auto unwrapping_n(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<Depth>(HPX_FORWARD(T, callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap_n() function and then passes the result to the given callable object.

See hpx::unwrapping() for a detailed description.

```
template<typename T>
auto unwrapping_all(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<0U>(HPX_FORWARD(T, callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the hpx::unwrap_all() function and then passes the result to the given callable object.

See hpx::unwrapping() for a detailed description.

namespace **functional**

```
struct unwrap
```

#include <unwrap.hpp> A helper function object for functionally invoking hpx::unwrap. For more information please refer to its documentation.

```
struct unwrap_all
```

#include <unwrap.hpp> A helper function object for functionally invoking hpx::unwrap_all. For more information please refer to its documentation.

```
template<std::size_t Depth>
```

struct `unwrap_n`

`#include <unwrap.hpp>` A helper function object for functionally invoking `hpx::unwrap_n`. For more information please refer to its documentation.

preprocessor

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

hpx/preprocessor/cat.hpp

Defined in header `hpx/preprocessor/cat.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

Defines**HPX_PP_CAT(A, B)**

Concatenates the tokens **A** and **B** into a single token. Evaluates to **AB**

Parameters

- **A** – First token
- **B** – Second token

hpx/preprocessor/expand.hpp

Defined in header `hpx/preprocessor/expand.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

Defines**HPX_PP_EXPAND(X)**

The `HPX_PP_EXPAND` macro performs a double macro-expansion on its argument.

This macro can be used to produce a delayed preprocessor expansion.

Example:

```
#define MACRO(a, b, c) (a)(b)(c)
#define ARGS() (1, 2, 3)

HPX_PP_EXPAND(MACRO ARGS()) // expands to (1)(2)(3)
```

Parameters

- **X** – Token to be expanded twice

hpx/preprocessor/nargs.hpp

Defined in header hpx/preprocessor/nargs.hpp.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

Defines

HPX_PP_NARGS(...)

Expands to the number of arguments passed in

Example Usage:

```
HPX_PP_NARGS(hpx, pp, nargs)
HPX_PP_NARGS(hpx, pp)
HPX_PP_NARGS(hpx)
```

Expands to:

```
3
2
1
```

Parameters

- ... – The variadic number of arguments

hpx/preprocessor/stringize.hpp

Defined in header hpx/preprocessor/stringize.hpp.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

Defines

HPX_PP_STRINGIZE(X)

The *HPX_PP_STRINGIZE* macro stringizes its argument after it has been expanded.

The passed argument X will expand to "X". Note that the stringizing operator (#) prevents arguments from expanding. This macro circumvents this shortcoming.

Parameters

- X – The text to be converted to a string literal

hpx/preprocessor/strip_parens.hpp

Defined in header hpx/preprocessor/strip_parens.hpp.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_STRIP_PARENS(X)

For any symbol X, this macro returns the same symbol from which potential outer parens have been removed. If no outer parens are found, this macros evaluates to X itself without error.

The original implementation of this macro is from Steven Watanbe as shown in <http://boost.2283326.n4.nabble.com/preprocessor-removing-parentheses-td2591973.html#a2591976>

```
HPX_PP_STRIP_PARENS(no_parens)
HPX_PP_STRIP_PARENS((with_parens))
```

Example Usage:

This produces the following output

```
no_parens
with_parens
```

Parameters

- **X** – Symbol to strip parens from

resiliency

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

hpx/resiliency/replay_executor.hpp

Defined in header hpx/resiliency/replay_executor.hpp.

runtime_configuration

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx::components::component_commandline_base

Defined in header hpx/components/component_commandline_base.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

Defines

HPX_REGISTER_COMMANDLINE_REGISTRY(RegistryType, componentname)

The macro *HPX_REGISTER_COMMANDLINE_REGISTRY* is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

HPX_REGISTER_COMMANDLINE_REGISTRY_DYNAMIC(RegistryType, componentname)

HPX_REGISTER_COMMANDLINE_OPTIONS()

The macro *HPX_REGISTER_COMMANDLINE_OPTIONS* is used to define the required Hpx.Plugin entry point for the command line option registry. This macro has to be used in not more than one compilation unit of a component module.

HPX_REGISTER_COMMANDLINE_OPTIONS_DYNAMIC()

namespace **hpx**

namespace **components**

struct **component_commandline_base**

#include <component_commandline_base.hpp> The **component_commandline_base** has to be used as a base class for all component command-line line handling registries.

Public Functions

`virtual ~component_commandline_base() = default`

`virtual hpx::program_options::options_description add_commandline_options() = 0`

Return any additional command line options valid for this component.

Note: This function will be executed by the runtime system during system startup.

Returns The module is expected to fill a `options_description` object with any additional command line options this component will handle.

HPX_REGISTER_COMPONENT_MODULE

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

Defines

HPX_REGISTER_COMPONENT_FACTORY(componentname)

This macro is used to register the given component factory with `Hpx.Plugin`. This macro has to be used for each of the component factories.

HPX_REGISTER_COMPONENT_MODULE()

This macro is used to define the required `Hpx.Plugin` entry points. This macro has to be used in exactly one compilation unit of a component module.

HPX_REGISTER_COMPONENT_MODULE_DYNAMIC()

namespace **hpx**

 namespace **components**

hpx/runtime_configuration/component_registry_base.hpp

Defined in header `hpx/runtime_configuration/component_registry_base.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

Defines

HPX_REGISTER_COMPONENT_REGISTRY(RegistryType, componentname)

This macro is used to register the given component factory with `Hpx.Plugin`. This macro has to be used for each of the components.

HPX_REGISTER_COMPONENT_REGISTRY_DYNAMIC(RegistryType, componentname)

HPX_REGISTER_REGISTRY_MODULE()

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module.

HPX_REGISTER_REGISTRY_MODULE_DYNAMIC()

namespace **hpx**

namespace **components**

struct **component_registry_base**

#include <component_registry_base.hpp> The `component_registry_base` has to be used as a base class for all component registries.

Public Functions

virtual ~**component_registry_base**() = default

virtual bool **get_component_info**(`std::vector<std::string>` &`fillini`, `std::string const &filepath`,
 bool `is_static` = false) = 0

Return the ini-information for all contained components.

Parameters

- **fillini** – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.
- **filepath** – [in]
- **is_static** – [in]

Returns Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

virtual void **register_component_type**() = 0

Register the component type represented by this component.

hpx/runtime_configuration/plugin_registry_base.hpp

Defined in header `hpx/runtime_configuration/plugin_registry_base.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_REGISTER_PLUGIN_BASE_REGISTRY(PluginType, name)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

HPX_REGISTER_PLUGIN_REGISTRY_MODULE()

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module.

HPX_REGISTER_PLUGIN_REGISTRY_MODULE_DYNAMIC()

namespace **hpx**

namespace **plugins**

struct **plugin_registry_base**

`#include <plugin_registry_base.hpp>` The `plugin_registry_base` has to be used as a base class for all plugin registries.

Public Functions

virtual ~**plugin_registry_base**() = default

virtual bool **get_plugin_info**(`std::vector<std::string>` &`fillini`) = 0

Return the configuration information for any plugin implemented by this module

Parameters `fillini` – [in, out] The module is expected to fill this vector with the initialization information (one line per vector element) for all plugins implemented in this module.

Returns Returns `true` if the parameter `fillini` has been successfully initialized with the registry data of all implemented in this module.

inline virtual void **init**(int*, char***, `util::runtime_configuration&`)

hpx::runtime_mode

Defined in header `hpx/init.hpp`⁷²⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Enums

enum class **runtime_mode** : `std::int8_t`

A HPX runtime can be executed in two different modes: console mode and worker mode.

Values:

enumerator **invalid**

enumerator **console**

The runtime is the console locality.

enumerator **worker**

The runtime is a worker locality.

⁷²⁶ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/init_runtime/include/hpx/init.hpp

enumerator connect

The runtime is a worker locality connecting late

enumerator local

The runtime is fully local.

enumerator default_

The runtime mode will be determined based on the command line arguments

enumerator last

Functions

`char const *get_runtime_mode_name(runtime_mode state) noexcept`

Get the readable string representing the name of the given runtime_mode constant.

`runtime_mode get_runtime_mode_from_name(std::string const &mode)`

Returns the internal representation (runtime_mode constant) from the readable string representing the name.

This represents the internal representation from the readable string representing the name.

Parameters `mode` – this represents the runtime mode

runtime_local

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/runtime_local/component_startup_shutdown_base.hpp

Defined in header hpx/runtime_local/component_startup_shutdown_base.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

Defines

`HPX_REGISTER_STARTUP_SHUTDOWN_REGISTRY(RegistryType, componentname)`

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

`HPX_REGISTER_STARTUP_SHUTDOWN_REGISTRY_DYNAMIC(RegistryType, componentname)`

`HPX_REGISTER_STARTUP_SHUTDOWN_FUNCTIONS()`

This macro is used to define the required Hpx.Plugin entry point for the startup/shutdown registry. This macro has to be used in not more than one compilation unit of a component module.

`HPX_REGISTER_STARTUP_SHUTDOWN_FUNCTIONS_DYNAMIC()`

namespace `hpx`

namespace **components**

struct **component_startup_shutdown_base**

#include <component_startup_shutdown_base.hpp> The `component_startup_shutdown_base` has to be used as a base class for all component startup/shutdown registries.

Public Functions

virtual ~**component_startup_shutdown_base**() = default

virtual bool **get_startup_function**(*startup_function_type* &*startup*, bool &*pre_startup*) = 0

Return any startup function for this component.

Parameters

- **startup** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre_startup** – [in, out] Will be set to true if the returned startup function is executed during the first round of calls.

Returns Returns *true* if the parameter *startup* has been successfully initialized with the startup function.

virtual bool **get_shutdown_function**(*shutdown_function_type* &*shutdown*, bool &*pre_shutdown*) = 0

Return any shutdown function for this component.

Parameters

- **shutdown** – [in, out] The module is expected to fill this function object with a reference to a shutdown function. This function will be executed by the runtime system during system shutdown.
- **pre_shutdown** – [in, out] Will be set to true if the returned shutdown function is executed during the first round of calls.

Returns Returns *true* if the parameter *shutdown* has been successfully initialized with the shutdown function.

hpx/runtime_local/custom_exception_info.hpp

Defined in header hpx/runtime_local/custom_exception_info.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

`std::string diagnostic_information(exception_info const &xi)`

Extract the diagnostic information embedded in the given exception and return a string holding a formatted message.

The function `hpx::diagnostic_information` can be used to extract all diagnostic information stored in the given exception instance as a formatted string. This simplifies debug output as it composes the diagnostics into one, easy to use function call. This includes the name of the source file and line number, the sequence number of the OS-thread and the HPX-thread id, the locality id and the stack backtrace of the point where the original exception was thrown.

See also:

`hpx::get_error_locality_id()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`,
`hpx::get_error_config()`, `hpx::get_error_state()`

Parameters `xi` – The parameter `e` will be inspected for all diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if any of the required allocation operations fail)

Returns The formatted string holding all the available diagnostic information stored in the given exception instance.

`std::uint32_t get_error_locality_id(hpx::exception_info const &xi) noexcept`

Return the locality id where the exception was thrown.

The function `hpx::get_error_locality_id` can be used to extract the diagnostic information element representing the locality id as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`,
`hpx::get_error_config()`, `hpx::get_error_state()`

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws nothing –

Returns The locality id of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return `hpx::naming::invalid_locality_id`.

`std::string get_error_host_name(hpx::exception_info const &xi)`

Return the hostname of the locality where the exception was thrown.

The function `hpx::get_error_host_name` can be used to extract the diagnostic information element representing the host name as stored in the given exception instance.

See also:

<code>hpx::diagnostic_information()</code>	<code>hpx::get_error_process_id()</code>	<code>hpx::get_error_function_name()</code>
<code>hpx::get_error_file_name()</code>	<code>hpx::get_error_line_number()</code>	<code>hpx::get_error_os_thread()</code>
<code>hpx::get_error_thread_id()</code>	<code>hpx::get_error_thread_description()</code>	<code>hpx::get_error()</code>
<code>hpx::get_error_backtrace()</code>	<code>hpx::get_error_env()</code>	<code>hpx::get_error_what()</code>
<code>hpx::get_error_state()</code>		<code>hpx::get_error_config()</code>

Parameters xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The hostname of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::int64_t get_error_process_id(hpx::exception_info const &xi) noexcept`

Return the (operating system) process id of the locality where the exception was thrown.

The function `hpx::get_error_process_id` can be used to extract the diagnostic information element representing the process id as stored in the given exception instance.

See also:

<code>hpx::diagnostic_information()</code>	<code>hpx::get_error_host_name()</code>	<code>hpx::get_error_function_name()</code>
<code>hpx::get_error_file_name()</code>	<code>hpx::get_error_line_number()</code>	<code>hpx::get_error_os_thread()</code>
<code>hpx::get_error_thread_id()</code>	<code>hpx::get_error_thread_description()</code>	<code>hpx::get_error()</code>
<code>hpx::get_error_backtrace()</code>	<code>hpx::get_error_env()</code>	<code>hpx::get_error_what()</code>
<code>hpx::get_error_state()</code>		<code>hpx::get_error_config()</code>

Parameters xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws nothing –

Returns The process id of the OS-process which threw the exception. If the exception instance does not hold this information, the function will return 0.

`std::string get_error_env(hpx::exception_info const &xi)`

Return the environment of the OS-process at the point the exception was thrown.

The function `hpx::get_error_env` can be used to extract the diagnostic information element representing the environment of the OS-process collected at the point the exception was thrown.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The environment from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string get_error_backtrace(hpx::exception_info const &xi)`

Return the stack backtrace from the point the exception was thrown.

The function `hpx::get_error_backtrace` can be used to extract the diagnostic information element representing the stack backtrace collected at the point the exception was thrown.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The stack back trace from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::size_t get_error_os_thread(hpx::exception_info const &xi)` noexcept

Return the sequence number of the OS-thread used to execute HPX-threads from which the exception was thrown.

The function `hpx::get_error_os_thread` can be used to extract the diagnostic information element representing the sequence number of the OS-thread as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters **xi** – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws nothing –

Returns The sequence number of the OS-thread used to execute the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size(-1)`.

`std::size_t get_error_thread_id(hpx::exception_info const &xi)` noexcept

Return the unique thread id of the HPX-thread from which the exception was thrown.

The function `hpx::get_error_thread_id` can be used to extract the diagnostic information element representing the HPX-thread id as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()` `hpx::get_error_thread_description()`, `hpx::get_error()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters **xi** – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws nothing –

Returns The unique thread id of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size(0)`.

`std::string get_error_thread_description(hpx::exception_info const &xi)`

Return any additionally available thread description of the HPX-thread from which the exception was thrown.

The function `hpx::get_error_thread_description` can be used to extract the diagnostic information element representing the additional thread description as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_backtrace()`,
`hpx::get_error_env()`, `hpx::get_error()`, `hpx::get_error_state()`, `hpx::get_error_what()`,
`hpx::get_error_config()`

Parameters **xi** – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns Any additionally available thread description of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string get_error_config(hpx::exception_info const &xi)`

Return the HPX configuration information point from which the exception was thrown.

The function `hpx::get_error_config` can be used to extract the HPX configuration information element representing the full HPX configuration information as stored in the given exception instance.

See also:

<code>hpx::diagnostic_information()</code> ,	<code>hpx::get_error_host_name()</code> ,	<code>hpx::get_error_process_id()</code> ,
<code>hpx::get_error_function_name()</code> ,	<code>hpx::get_error_file_name()</code> ,	<code>hpx::get_error_line_number()</code> ,

<code>hpx::get_error_env()</code> ,	<code>hpx::get_error()</code> ,	<code>hpx::get_error_state()</code>
<code>hpx::get_error_thread_description()</code>		<code>hpx::get_error_what()</code> ,

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns Any additionally available HPX configuration information the point from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string get_error_state(hpx::exception_info const &xi)`

Return the HPX runtime state information at which the exception was thrown.

The function `hpx::get_error_state` can be used to extract the HPX runtime state information element representing the state the runtime system is currently in as stored in the given exception instance.

See also:

<code>hpx::diagnostic_information()</code> ,	<code>hpx::get_error_host_name()</code> ,	<code>hpx::get_error_process_id()</code> ,
<code>hpx::get_error_function_name()</code> ,	<code>hpx::get_error_file_name()</code> ,	<code>hpx::get_error_line_number()</code> ,
<code>hpx::get_error_os_thread()</code> ,	<code>hpx::get_error_thread_id()</code> ,	<code>hpx::get_error_backtrace()</code> ,
<code>hpx::get_error_env()</code> ,	<code>hpx::get_error()</code> ,	<code>hpx::get_error_what()</code> ,
<code>hpx::get_error_thread_description()</code>		<code>hpx::get_error_state()</code>

Parameters `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws `std::bad_alloc` – (if one of the required allocations fails)

Returns The point runtime state at the point at which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

hpx::get_locality_id

Defined in header `hpx/runtime.hpp`⁷²⁷.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Functions

`std::uint32_t get_locality_id(error_code &ec = throws)`

Return the number of the locality this function is being called from.

This function returns the id of the current locality.

Note: The returned value is zero based and its maximum value is smaller than the overall number of localities the current application is running on (as returned by `get_num_localities()`).

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise, it throws an instance of `hpx::exception`.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

hpx::get_locality_name

Defined in header `hpx/runtime.hpp`⁷²⁸.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Functions

`std::string get_locality_name()`

Return the name of the locality this function is called on.

This function returns the name for the locality on which this function is called.

See also:

`future<std::string> get_locality_name(hpx::id_type const& id)`

⁷²⁷ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/runtime.hpp>

⁷²⁸ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/runtime.hpp>

Returns This function returns the name for the locality on which the function is called. The name is retrieved from the underlying networking layer and may be different for different parcelports.

hpx::get_initial_num_localities, hpx::get_num_localities

Defined in header `hpx/runtime.hpp`⁷²⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

`std::uint32_t get_initial_num_localities()`

Return the number of localities which were registered at startup for the running application.

The function `get_initial_num_localities` returns the number of localities which were connected to the console at application startup.

See also:

`hpx::find_all_localities, hpx::get_num_localities`

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise, it throws an instance of `hpx::exception`.

`hpx::future<std::uint32_t> get_num_localities()`

Asynchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` asynchronously returns the number of localities currently connected to the console. The returned future represents the actual result.

See also:

`hpx::find_all_localities, hpx::get_num_localities`

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

`std::uint32_t get_num_localities(launch::sync_policy, error_code &ec = throws)`

Return the number of localities which are currently registered for the running application.

The function `get_num_localities` returns the number of localities currently connected to the console.

See also:

`hpx::find_all_localities, hpx::get_num_localities`

⁷²⁹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/runtime.hpp>

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx/runtime_local/get_os_thread_count.hpp

Defined in header `hpx/runtime_local/get_os_thread_count.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Functions

`std::size_t get_os_thread_count()`

Return the number of OS-threads running in the runtime instance the current HPX-thread is associated with.

`std::size_t get_os_thread_count(threads::executor const &exec)`

Return the number of worker OS- threads used by the given executor to execute HPX threads.

This function returns the number of cores used to execute HPX threads for the given executor. If the function is called while no HPX runtime system is active, it will return zero. If the executor is not valid, this function will fall back to retrieving the number of OS threads used by HPX.

Parameters **exec** – [in] The executor to be used.

namespace **threads**

hpx::get_thread_name

Defined in header `hpx/runtime.hpp`⁷³⁰.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

⁷³⁰ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/runtime.hpp>

Functions

`std::string get_thread_name()`

Return the name of the calling thread.

This function returns the name of the calling thread. This name uniquely identifies the thread in the context of HPX. If the function is called while no HPX runtime system is active, the result will be “<unknown>”.

`hpx/runtime_local/get_worker_thread_num.hpp`

Defined in header `hpx/runtime_local/get_worker_thread_num.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

`hpx/runtime_local/report_error.hpp`

Defined in header `hpx/runtime_local/report_error.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

namespace `hpx`

Functions

`void report_error(std::size_t num_thread, std::exception_ptr const &e)`

The function `report_error` reports the given exception to the console.

`void report_error(std::exception_ptr const &e)`

The function `report_error` reports the given exception to the console.

`hpx/runtime_local/runtime_local.hpp`

Defined in header `hpx/runtime_local/runtime_local.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

namespace `hpx`

Functions

`void set_error_handlers(hpx::util::runtime_configuration const &cfg)`

class `runtime`

Public Types

`using notification_policy_type = threads::policies::callback_notifier`

Generate a new notification policy instance for the given thread name prefix

`using hpx_main_function_type = int()`

The `hpx_main_function_type` is the default function type usable as the main HPX thread function.

`using hpx_errorssink_function_type = void(std::uint32_t, std::string const&)`

Public Functions

`virtual notification_policy_type get_notification_policy(char const *prefix, runtime_local::os_thread_type type)`

`state get_state() const`

`void set_state(state s)`

`explicit runtime(hpx::util::runtime_configuration rtcfg, bool initialize)`

Construct a new HPX runtime instance.

`virtual ~runtime()`

The destructor makes sure all HPX runtime services are properly shut down before exiting.

`void on_exit(hpx::function<void()> const &f)`

Manage list of functions to call on exit.

`void starting()`

Manage runtime ‘stopped’ state.

`void stopping()`

Call all registered on_exit functions.

`bool stopped() const`

This accessor returns whether the runtime instance has been stopped.

`hpx::util::runtime_configuration &get_config()`

access configuration information

`hpx::util::runtime_configuration const &get_config() const`

`std::size_t get_instance_number() const`

`util::thread_mapper &get_thread_mapper() const`

Return a reference to the internal PAPI thread manager.

`threads::topology const &get_topology() const`

`virtual int run(hpx::function<hpx_main_function_type> const &func)`

Run the HPX runtime system, use the given function for the main `thread` and block waiting for all threads to finish.

Note: The parameter `func` is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

Parameters `func` – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef `hpx_main_function_type`. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

Returns This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

`virtual int run()`

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

Returns This function will always return 0 (zero).

`virtual void rethrow_exception()`

Rethrow any stored exception (to be called after `stop()`)

`virtual int start(hpx::function<hpx_main_function_type> const &func, bool blocking = false)`

Start the runtime system.

Parameters

- `func` – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef `hpx_main_function_type`.
- `blocking` – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function `runtime::start` will call `runtime::wait` internally.

Returns If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise, it will return zero.

`virtual int start(bool blocking = false)`

Start the runtime system.

Parameters `blocking` – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function `runtime::start` will call `runtime::wait` internally .

Returns If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise, it will return zero.

`virtual int wait()`

Wait for the shutdown action to be executed.

Returns This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

`virtual void stop(bool blocking = true)`

Initiate termination of the runtime system.

Parameters `blocking` – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

`virtual int suspend()`

Suspend the runtime system.

```

virtual int resume()
    Resume the runtime system.

virtual int finalize(double)

virtual bool is_networking_enabled()
    Return true if networking is enabled.

virtual hpx::threads::threadmanager &get_thread_manager()
    Allow access to the thread manager instance used by the HPX runtime.

virtual std::string here() const
    Returns a string of the locality endpoints (usable in debug output)

virtual bool report_error(std::size_t num_thread, std::exception_ptr const &e, bool terminate_all =
    true)
    Report a non-recoverable error to the runtime system.

Parameters

- num_thread – [in] The number of the operating system thread the error has been detected in.
- e – [in] This is an instance encapsulating an exception which lead to this function call.
- terminate_all – [in] signal whether all localities should be terminated

virtual bool report_error(std::exception_ptr const &e, bool terminate_all = true)
    Report a non-recoverable error to the runtime system.

```

Note: This function will retrieve the number of the current shepherd thread and forward to the report_error function above.

Parameters

- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] signal whether all localities should be terminated

```

virtual void add_pre_startup_function(startup_function_type f)
    Add a function to be executed inside a HPX thread before hpx_main but guaranteed to be executed before any startup function registered with add_startup_function.

```

Note: The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

Parameters **f** – The function ‘f’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to set up the runtime environment of the application (install performance counters, etc.)

```

virtual void add_startup_function(startup_function_type f)
    Add a function to be executed inside a HPX thread before hpx_main

Parameters f – The function ‘f’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to set up the runtime environment of the application (install performance counters, etc.)

```

```

virtual void add_pre_shutdown_function(shutdown_function_type f)
    Add a function to be executed inside a HPX thread during hpx::finalize, but guaranteed before any of the shutdown functions is executed.

```

Note: The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

Parameters **f** – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual void **add_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed inside a HPX thread during hpx::finalize

Parameters **f** – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual *hpx::util::io_service_pool* ***get_thread_pool**(char const *name)

Access one of the internal thread pools (io_service instances) HPX is using to perform specific tasks. The three possible values for the argument name are “main_pool”, “io_pool”, “parcel_pool”, and “timer_pool”. For any other argument value the function will return zero.

virtual bool **register_thread**(char const *name, *std::size_t* num = 0, bool service_thread = true, *error_code* &ec = *throws*)

Register an external OS-thread with HPX.

This function should be called from any OS-thread which is external to HPX (not created by HPX), but which needs to access HPX functionality, such as setting a value on a promise or similar.

‘main’, ‘io’, ‘timer’, ‘parcel’, ‘worker’

Note: The function will compose a thread name of the form ‘<name>-thread#<num>’ which is used to register the thread. It is the user’s responsibility to ensure that each (composed) thread name is unique. HPX internally uses the following names for the threads it creates, do not reuse those:

Note: This function should be called for each thread exactly once. It will fail if it is called more than once.

Parameters

- **name** – [in] The name to use for thread registration.
- **num** – [in] The sequence number to use for thread registration. The default for this parameter is zero.
- **service_thread** – [in] The thread should be registered as a service thread. The default for this parameter is ‘true’. Any service threads will be pinned to cores not currently used by any of the HPX worker threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function will return whether the requested operation succeeded or not.

virtual bool **unregister_thread**()

Unregister an external OS-thread with HPX.

This function will unregister any external OS-thread from HPX.

Note: This function should be called for each thread exactly once. It will fail if it is called more than once. It will fail as well if the thread has not been registered before (see *register_thread*).

Returns This function will return whether the requested operation succeeded or not.

```
virtual runtime_local::os_thread_data get_os_thread_data(std::string const &label) const
    Access data for a given OS thread that was previously registered by register_thread.
```

```
virtual bool enumerate_os_threads(hpx::function<bool(runtime_local::os_thread_data const&)>
    const &f) const
```

Enumerate all OS threads that have registered with the runtime.

```
notification_policy_type::on_startstop_type on_start_func() const
```

```
notification_policy_type::on_startstop_type on_stop_func() const
```

```
notification_policy_type::on_error_type on_error_func() const
```

```
notification_policy_type::on_startstop_type on_start_func(notification_policy_type::on_startstop_type&&)
```

```
notification_policy_type::on_startstop_type on_stop_func(notification_policy_type::on_startstop_type&&)
```

```
notification_policy_type::on_error_type on_error_func(notification_policy_type::on_error_type&&)
```

```
virtual std::uint32_t get_locality_id(error_code &ec) const
```

```
virtual std::size_t get_num_worker_threads() const
```

```

```

```
virtual std::uint32_t get_initial_num_localities() const
```

```
virtual hpx::future<std::uint32_t> get_num_localities() const
```

```
virtual std::string get_locality_name() const
```

```
virtual std::uint32_t assign_cores(std::string const&, std::uint32_t)
```

```
virtual std::uint32_t assign_cores()
```

```
inline hpx::program_options::options_description const &get_app_options() const
```

```
inline void set_app_options(hpx::program_options::options_description const &app_options)
```

Public Static Functions

```
static std::uint64_t get_system_uptime()
```

Return the system uptime measure on the thread executing this call.

Protected Types

```
using on_exit_type = std::vector<hpx::function<void()>>
```

Protected Functions

```
explicit runtime(hpx::util::runtime_configuration rtcfg)

Private Functions

```
void stop_helper(bool blocking, std::condition_variable &cond, std::mutex &mtx) const
```

Helper function to stop the runtime.

Parameters

- **blocking** – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.
- **cond** –
- **mtx** –

```
void deinit_tss_helper(char const *context, std::size_t num) const
```

```
void init_tss_ex(char const *context, runtime_local::os_thread_type type, std::size_t
local_thread_num, std::size_t global_thread_num, char const *pool_name, char
const *postfix, bool service_thread, error_code &ec) const
```

```
void init_tss_helper(char const *context, runtime_local::os_thread_type type, std::size_t

hpx::program_options::options_description app_options_
```

namespace **threads**

Functions

```
char const *get_stack_size_name(std::ptrdiff_t size)
```

Returns the stack size name.

Get the readable string representing the given stack size constant.

Parameters **size** – this represents the stack size

```
std::ptrdiff_t get_default_stack_size()
```

Returns the default stack size.

Get the default stack size in bytes.

```
std::ptrdiff_t get_stack_size(thread_stacksize)
```

Returns the stack size corresponding to the given stack size enumeration.

Get the stack size corresponding to the given stack size enumeration.

Parameters **size** – this represents the stack size

namespace **util**

Functions

```
bool retrieve_commandline_arguments(hpx::program_options::options_description const &app_options, hpx::program_options::variables_map &vm)
```

```
bool retrieve_commandline_arguments(std::string const &appname, hpx::program_options::variables_map &vm)
```

```
hpx::register_thread, hpx::unregister_thread, hpx::get_os_thread_data,  

hpx::enumerate_os_threads, hpx::get_runtime_instance_number, hpx::register_on_exit,  

hpx::is_starting, hpx::tolerate_node_faults, hpx::is_running, hpx::is_stopped,  

hpx::is_stopped_or_shutting_down, hpx::get_num_worker_threads, hpx::get_system_uptime
```

Defined in header `hpx/runtime.hpp`⁷³¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
bool register_thread(runtime *rt, char const *name, error_code &ec = throws)
```

Register the current kernel thread with HPX, this should be done once for each external OS-thread intended to invoke HPX functionality. Calling this function more than once will return false.

```
void unregister_thread(runtime *rt)
```

Unregister the thread from HPX, this should be done once in the end before the external thread exists.

```
runtime_local::os_thread_data get_os_thread_data(std::string const &label)
```

Access data for a given OS thread that was previously registered by *register_thread*. This function must be called from a thread that was previously registered with the runtime.

```
bool enumerate_os_threads(hpx::function<bool(os_thread_data const&)> const &f)
```

Enumerate all OS threads that have registered with the runtime.

```
std::size_t get_runtime_instance_number()
```

Return the runtime instance number associated with the runtime instance the current thread is running in.

```
bool register_on_exit(hpx::function<void()> const&)
```

Register a function to be called during system shutdown.

```
bool is_starting()
```

Test whether the runtime system is currently being started.

This function returns whether the runtime system is currently being started or not, e.g. whether the current state of the runtime system is *hpx::state::startup*

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

⁷³¹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/runtime.hpp>

`bool tolerate_node_faults()`

Test if HPX runs in fault-tolerant mode.

This function returns whether the runtime system is running in fault-tolerant mode

`bool is_running()`

Test whether the runtime system is currently running.

This function returns whether the runtime system is currently running or not, e.g. whether the current state of the runtime system is `hpx::state::running`

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

`bool is_stopped()`

Test whether the runtime system is currently stopped.

This function returns whether the runtime system is currently stopped or not, e.g. whether the current state of the runtime system is `hpx::state::stopped`

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

`bool is_stopped_or_shutting_down()`

Test whether the runtime system is currently being shut down.

This function returns whether the runtime system is currently being shut down or not, e.g. whether the current state of the runtime system is `hpx::state::stopped` or `hpx::state::shutdown`

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

`std::size_t get_num_worker_threads()`

Return the number of worker OS- threads used to execute HPX threads.

This function returns the number of OS-threads used to execute HPX threads. If the function is called while no HPX runtime system is active, it will return zero.

`std::uint64_t get_system_uptime()`

Return the system uptime measure on the thread executing this call.

This function returns the system uptime measured in nanoseconds for the thread executing this call. If the function is called while no HPX runtime system is active, it will return zero.

namespace `threads`

hpx/runtime_local/service_executors.hpp

Defined in header `hpx/runtime_local/service_executors.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

 namespace **execution**

 namespace **experimental**

Enums

enum class **service_executor_type** : `std::uint8_t`

Values:

enumerator **io_thread_pool**

Selects creating a service executor using the I/O pool of threads

enumerator **parcel_thread_pool**

Selects creating a service executor using the parcel pool of threads

enumerator **timer_thread_pool**

Selects creating a service executor using the timer pool of threads

enumerator **main_thread**

Selects creating a service executor using the main thread

struct **io_pool_executor** : public `hpx::execution::experimental::service_executor`

Public Functions

io_pool_executor()

struct **main_pool_executor** : public `hpx::execution::experimental::service_executor`

```

Public Functions

timer_pool_executor()

hpx::shutdown_function_type, **hpx::register_pre_shutdown_function**, **hpx::register_shutdown_function**

Defined in header `hpx/runtime.hpp`⁷³².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

TypeDefs

```
using shutdown_function_type = hpx::move_only_function<void()>
```

The type of the function which is registered to be executed as a shutdown or pre-shutdown function.

⁷³² <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/runtime.hpp>

Functions

void **register_pre_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed by a HPX thread during *hpx::finalize()* but guaranteed before any shutdown function is executed (system-wide)

Any of the functions registered with *register_pre_shutdown_function* are guaranteed to be executed by an HPX thread during the execution of *hpx::finalize()* before any of the registered shutdown functions are executed (see: [hpx::register_shutdown_function\(\)](#)).

See also:

[hpx::register_shutdown_function\(\)](#)

Note: If this function is called while the pre-shutdown functions are being executed, or after that point, it will raise an `invalid_status` exception.

Parameters **f** – [in] The function to be registered to run by an HPX thread as a pre-shutdown function.

void **register_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed by a HPX thread during *hpx::finalize()* but guaranteed after any pre-shutdown function is executed (system-wide)

Any of the functions registered with *register_shutdown_function* are guaranteed to be executed by an HPX thread during the execution of *hpx::finalize()* after any of the registered pre-shutdown functions are executed (see: [hpx::register_pre_shutdown_function\(\)](#)).

See also:

[hpx::register_pre_shutdown_function\(\)](#)

Note: If this function is called while the shutdown functions are being executed, or after that point, it will raise an `invalid_status` exception.

Parameters **f** – [in] The function to be registered to run by an HPX thread as a shutdown function.

hpx::startup_function_type, hpx::register_pre_startup_function, hpx::register_startup_function

Defined in header [hpx/runtime.hpp](#)⁷³³.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

⁷³³ <http://github.com/STEllAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/runtime.hpp>

TypeDefs

```
using startup_function_type = hpx::move_only_function<void()>
```

The type of the function which is registered to be executed as a startup or pre-startup function.

Functions

```
void register_pre_startup_function(startup_function_type f)
```

Add a function to be executed by a HPX thread before `hpx_main` but guaranteed before any startup function is executed (system-wide).

Any of the functions registered with `register_pre_startup_function` are guaranteed to be executed by an HPX thread before any of the registered startup functions are executed (see [hpx::register_startup_function\(\)](#)).

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

See also:

[hpx::register_startup_function\(\)](#)

Note: If this function is called while the pre-startup functions are being executed or after that point, it will raise an `invalid_status` exception.

Parameters **f** – [in] The function to be registered to run by an HPX thread as a pre-startup function.

```
void register_startup_function(startup_function_type f)
```

Add a function to be executed by a HPX thread before `hpx_main` but guaranteed after any pre-startup function is executed (system-wide).

Any of the functions registered with `register_startup_function` are guaranteed to be executed by an HPX thread after any of the registered pre-startup functions are executed (see: [hpx::register_pre_startup_function\(\)](#)), but before `hpx_main` is being called.

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

See also:

[hpx::register_pre_startup_function\(\)](#)

Note: If this function is called while the startup functions are being executed or after that point, it will raise an `invalid_status` exception.

Parameters **f** – [in] The function to be registered to run by an HPX thread as a startup function.

hpx/runtime_local/thread_hooks.hpp

Defined in header hpx/runtime_local/thread_hooks.hpp.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Functions

threads::policies::callback_notifier::on_startstop_type **get_thread_on_start_func()**

Retrieve the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *register_thread_on_start_func*).

Note: This function can be called before the HPX runtime is initialized.

Returns The currently installed error handler function.

threads::policies::callback_notifier::on_startstop_type **get_thread_on_stop_func()**

Retrieve the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *register_thread_on_stop_func*).

Note: This function can be called before the HPX runtime is initialized.

Returns The currently installed error handler function.

threads::policies::callback_notifier::on_error_type **get_thread_on_error_func()**

Retrieve the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *register_thread_on_error_func*).

Note: This function can be called before the HPX runtime is initialized.

Returns The currently installed error handler function.

threads::policies::callback_notifier::on_startstop_type **register_thread_on_start_func**(*threads::policies::callback_notifier*:&&f)

Set the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference,

thus the caller needs to make sure any newly registered start function chains into the previous one (see `get_thread_on_start_func`).

Note: This function can be called before the HPX runtime is initialized.

Parameters `f` – The function to install as the new start handler.

Returns The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

`threads::policies::callback_notifier::on_startstop_type register_thread_on_stop_func(threads::policies::callback_notifier::on_startstop_type&&f)`

Set the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see `get_thread_on_stop_func`).

Note: This function can be called before the HPX runtime is initialized.

Parameters `f` – The function to install as the new stop handler.

Returns The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

`threads::policies::callback_notifier::on_error_type register_thread_on_error_func(threads::policies::callback_notifier::on_error_type&&f)`

Set the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see `get_thread_on_error_func`).

Note: This function can be called before the HPX runtime is initialized.

Parameters `f` – The function to install as the new error handler.

Returns The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

hpx/runtime_local/thread_pool_helpers.hpp

Defined in header `hpx/runtime_local/thread_pool_helpers.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resource**

Functions

`std::size_t get_num_thread_pools()`

Return the number of thread pools currently managed by the *resource_partitioner*

`std::size_t get_num_threads()`

Return the number of threads in all thread pools currently managed by the *resource_partitioner*

`std::size_t get_num_threads(std::string const &pool_name)`

Return the number of threads in the given thread pool currently managed by the *resource_partitioner*

`std::size_t get_num_threads(std::size_t pool_index)`

Return the number of threads in the given thread pool currently managed by the *resource_partitioner*

`std::size_t get_pool_index(std::string const &pool_name)`

Return the internal index of the pool given its name.

`std::string const &get_pool_name(std::size_t pool_index)`

Return the name of the pool given its internal index.

`threads::thread_pool_base &get_thread_pool(std::string const &pool_name)`

Return the name of the pool given its name.

`threads::thread_pool_base &get_thread_pool(std::size_t pool_index)`

Return the thread pool given its internal index.

`bool pool_exists(std::string const &pool_name)`

Return true if the pool with the given name exists.

`bool pool_exists(std::size_t pool_index)`

Return true if the pool with the given index exists.

namespace **threads**

Functions

`std::int64_t get_thread_count(thread_schedule_state state = thread_schedule_state::unknown)`

The function *get_thread_count* returns the number of currently known threads.

Note: If state == unknown this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

Parameters **state** – [in] This specifies the thread-state for which the number of threads should be retrieved.

`std::int64_t get_thread_count(thread_priority priority, thread_schedule_state state = thread_schedule_state::unknown)`

The function *get_thread_count* returns the number of currently known threads.

Note: If state == unknown this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

Parameters

- **priority** – [in] This specifies the thread-priority for which the number of threads should be retrieved.
- **state** – [in] This specifies the thread-state for which the number of threads should be retrieved.

`std::int64_t get_idle_core_count()`

The function `get_idle_core_count` returns the number of currently idling threads (cores).

`mask_type get_idle_core_mask()`

The function `get_idle_core_mask` returns a bit-mask representing the currently idling threads (cores).

`bool enumerate_threads(hpx::function<bool(thread_id_type)> const &f, thread_schedule_state state = thread_schedule_state::unknown)`

The function `enumerate_threads` will invoke the given function `f` for each thread with a matching thread state.

Parameters

- **f** – [in] The function which should be called for each matching thread. Returning ‘false’ from this function will stop the enumeration process.
- **state** – [in] This specifies the thread-state for which the threads should be enumerated.

serialization

synchronization

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx::barrier

Defined in header `hpx/barrier.hpp`⁷³⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

```
template<typename OnCompletion = detail::empty_oncompletion>
```

```
class barrier
```

#include <barrier.hpp> A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier. [Note: A barrier is useful for managing repeated tasks that are handled by multiple threads. - end note] Each barrier phase consists of the following steps:

- The expected count is decremented by each call to `arrive` or `arrive_and_drop`.
- When the expected count reaches zero, the phase completion step is run. For the specialization with the default value of the `CompletionFunction` template parameter, the completion step is run as part of the call to `arrive` or `arrive_and_drop` that caused the expected count to reach zero. For other specializations, the completion step is run on one of the threads that arrived at the barrier during the phase.
- When the completion step finishes, the expected count is reset to what was specified by the `expected` argument to the constructor, possibly adjusted by calls to `arrive_and_drop`, and the next phase starts.

Each phase defines a phase synchronization point. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run. The phase completion step that is executed at the end of each phase has the following effects:

⁷³⁴ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/barrier.hpp>

- Invokes the completion function, equivalent to completion().
- Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the CompletionFunction template parameter, the behavior is undefined if any of the barrier object's member functions other than wait are called while the completion step is in progress.

Concurrent invocations of the member functions of barrier, other than its destructor, do not introduce data races. The member functions arrive and arrive_and_drop execute atomically.

CompletionFunction shall meet the Cpp17MoveConstructible (Table 28) and Cpp17Destructible (Table 32) requirements. `std::is_nothrow_invocable_v<CompletionFunction&>` shall be true.

The default value of the CompletionFunction template parameter is an unspecified type, such that, in addition to satisfying the requirements of CompletionFunction, it meets the Cpp17DefaultConstructible requirements (Table 27) and completion() has no effects.

`barrier::arrival_token` is an unspecified type, such that it meets the Cpp17MoveConstructible (Table 28), Cpp17MoveAssignable (Table 30), and Cpp17Destructible (Table 32) requirements.

Public Types

```
using arrival_token = bool
```

Public Functions

inline explicit constexpr **barrier**(`std::ptrdiff_t` expected, *OnCompletion* completion = *OnCompletion()*)

Preconditions: expected >= 0 is true and expected <= max() is true.

Effects: Sets both the initial expected count for each barrier phase and the current expected count for the first phase to expected. Initializes completion with `std::move(f)`. Starts the first phase. [Note: If expected is 0 this object can only be destroyed.- end note]

Throws: Any exception thrown by CompletionFunction's move constructor.

~barrier() = default

inline *arrival_token* **arrive**(`std::ptrdiff_t` update = 1)

Preconditions: update > 0 is true, and update is less than or equal to the expected count for the current barrier phase.

Effects: Constructs an object of type arrival_token that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by update.

Synchronization: The call to arrive strongly happens before the start of the phase completion step for the current phase.

Error conditions: Any of the error conditions allowed for mutex types([thread.mutex.requirements.mutex]). [Note: This call can cause the completion step for the current phase to start.- end note]

Throws `system_error` – when an exception is required ([thread.req.exception]).

Returns : The constructed arrival_token object.

```
inline void wait(arrival_token &&old_phase) const
```

Preconditions: arrival is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

Effects: Blocks at the synchronization point associated with HPX_MOVE(arrival) until the phase completion step of the synchronization point's phase is run. [Note: If arrival is associated with the synchronization point for a previous phase, the call returns immediately. - end note]

Throws system_error – when an exception is required ([thread.req.exception]).

Error conditions: Any of the error conditions allowed for mutex types ([thread.mutex.requirements.mutex]).

```
inline void arrive_and_wait()
```

Effects: Equivalent to: wait(arrive()).

```
inline void arrive_and_drop()
```

Preconditions: The expected count for the current barrier phase is greater than zero.

Effects: Decrements the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.

Synchronization: The call to arrive_and_drop strongly happens before the start of the phase completion step for the current phase.

Throws system_error – when an exception is required ([thread.req.exception]).Error

conditions: Any of the error conditions allowed for mutex types ([thread.mutex.requirements.mutex]). [Note: This call can cause the completion step for the current phase to start.- end note]

hpx::binary_semaphore

Defined in header `hpx/semaphore.hpp`⁷³⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

class **binary_semaphore**

`#include <binary_semaphore.hpp>` A binary semaphore is a semaphore object that has only two states. `binary_semaphore` is an alias for specialization of `hpx::counting_semaphore` with `Least.MaxValue` being 1. HPX's implementation of `binary_semaphore` is more efficient than the default implementation of a counting semaphore with a unit resource count (`hpx::counting_semaphore`).

Public Functions

binary_semaphore(`binary_semaphore` const&) = delete

`binary_semaphore` &**operator=(**`binary_semaphore` const&) = delete

binary_semaphore(`binary_semaphore`&&) = delete

`binary_semaphore` &**operator=(**`binary_semaphore`&&) = delete

explicit **binary_semaphore**(`std::ptrdiff_t` value = 1)

Constructs an object of type `hpx::binary_semaphore` with the internal counter initialized to `value`.

Parameters `value` – The initial value of the internal semaphore lock count. Normally this value should be zero (which is the default), values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set.

~binary_semaphore() = default

void release(`std::ptrdiff_t` update = 1)

Atomically increments the internal counter by the value of `update`. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in `acquire`, will subsequently be unblocked.

Note: Synchronization: Strongly happens before invocations of `try_acquire` that observe the result of the effects.

Throws `std::system_error` –

Parameters `update` – the amount to increment the internal counter by

Pre Both `update >= 0` and `update <= max()` – `counter` are `true`, where `counter` is the value of the internal counter.

bool try_acquire() noexcept

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

Returns `true` if it decremented the internal counter, otherwise `false`

⁷³⁵ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/semaphore.hpp

```
void acquire()
```

Repeatedly performs the following steps, in order:

- Evaluates `try_acquire`. If the result is true, returns.

Blocks on `*this` until counter is greater than zero.

Throws `std::system_error` –

Returns `void`.

```
bool try_acquire_until(hpx::chrono::steady_time_point const &abs_time)
```

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *abs_time* time point has been passed.

Parameters `abs_time` – the earliest time the function must wait until in order to fail

Throws `std::system_error` –

Returns `true` if it decremented the internal counter, otherwise `false`.

```
bool try_acquire_for(hpx::chrono::steady_duration const &rel_time)
```

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *rel_time* duration has been exceeded.

Throws `std::system_error` –

Parameters `rel_time` – the minimum duration the function must wait for to fail

Returns `true` if it decremented the internal counter, otherwise false

Public Static Functions

```
static constexpr std::ptrdiff_t max() noexcept
```

Returns The maximum value of counter. This value is greater than or equal to *Least.MaxValue*.

Returns The internal counter's maximum possible value, as a `std::ptrdiff_t`.

`hpx::condition_variable`, `hpx::condition_variable_any`, `hpx::cv_status`

Defined in header `hpx/condition_variable.hpp`⁷³⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace `hpx`

Enums

enum class `cv_status`

The scoped enumeration `hpx::cv_status` describes whether a timed wait returned because of timeout or not. `hpx::cv_status` is used by the `wait_for` and `wait_until` member functions of `hpx::condition_variable` and `hpx::condition_variable_any`.

Values:

⁷³⁶ http://github.com/STEllAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/condition_variable.hpp

enumerator no_timeout

The condition variable was awakened with *notify_all*, *notify_one*, or spuriously

enumerator timeout

the condition variable was awakened by timeout expiration

enumerator error

there was an error

class condition_variable

`#include <condition_variable.hpp>` The `condition_variable` class is a synchronization primitive that can be used to block a thread, or multiple threads at the same time, until another thread both modifies a shared variable (the condition), and notifies the `condition_variable`.

The thread that intends to modify the shared variable has to

- i. acquire a `hpx::mutex` (typically via `std::lock_guard`)
- ii. perform the modification while the lock is held
- iii. execute `notify_one` or `notify_all` on the `condition_variable` (the lock does not need to be held for notification)

Even if the shared variable is atomic, it must be modified under the mutex in order to correctly publish the modification to the waiting thread. Any thread that intends to wait on `condition_variable` has to

- i. acquire a `std::unique_lock<hpx::mutex>`, on the same mutex as used to protect the shared variable
- ii. either
 - A. check the condition, in case it was already updated and notified
 - B. execute `wait`, `await_for`, or `wait_until`. The wait operations atomically release the mutex and suspend the execution of the thread.
 - C. When the condition variable is notified, a timeout expires, or a spurious wakeup occurs, the thread is awakened, and the mutex is atomically reacquired. The thread should then check the condition and resume waiting if the wake up was spurious. or
 - A. use the predicated overload of `wait`, `wait_for`, and `wait_until`, which takes care of the three steps above.

`hpx::condition_variable` works only with `std::unique_lock<hpx::mutex>`. This restriction allows for maximal efficiency on some platforms. `hpx::condition_variable_any` provides a condition variable that works with any `BasicLockable`⁷³⁷ object, such as `std::shared_lock`.

Condition variables permit concurrent invocation of the `wait`, `wait_for`, `wait_until`, `notify_one` and `notify_all` member functions.

The class `hpx::condition_variable` is a `StandardLayoutType`⁷³⁸. It is not `CopyConstructible`⁷³⁹, `MoveConstructible`⁷⁴⁰, `CopyAssignable`⁷⁴¹, or `MoveAssignable`⁷⁴².

Public Functions

inline **condition_variable()**

Construct an object of type `hpx::condition_variable`.

~condition_variable() = default

Destroys the object of type `hpx::condition_variable`.

IOW, `~condition_variable()` can execute before a signaled thread returns from a wait. If this happens with `condition_variable`, that waiting thread will attempt to lock the destructed mutex. To fix this, there must be shared ownership of the data members between the `condition_variable` object and the member functions `wait` (`wait_for`, etc.).

Note: Preconditions: There is no thread blocked on `*this`. [Note: That is, all threads have been notified; they could subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on `*this` once the destructor has been started, especially when the waiting threads are calling the `wait` functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. end note]

condition_variable(`condition_variable const&`) = delete

condition_variable(`condition_variable&&`) = delete

`condition_variable &operator=(condition_variable const&) = delete`

`condition_variable &operator=(condition_variable&&) = delete`

inline void **notify_one(`error_code &ec = throws`) const**

If any threads are waiting on `*this`, calling `notify_one` unblocks one of the waiting threads.

Parameters `ec` – Used to hold error code value originated during the operation. Defaults to `throws`; A special ‘throw on error’ `error_code`.

Returns `notify_one` returns `void`.

inline void **notify_all(`error_code &ec = throws`) const**

Unblocks all threads currently waiting for `*this`.

Parameters `ec` – Used to hold error code value originated during the operation. Defaults to `throws`; A special ‘throw on error’ `error_code`.

Returns `notify_all` returns `void`.

template<typename **Mutex**>

inline void **wait(`std::unique_lock<Mutex> &lock, error_code &ec = throws`)**

`wait` causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred())==true`).

Atomically unlocks lock, blocks the current executing thread, and adds it to the list of threads waiting on `*this`. The thread will be unblocked when `notify_all()` or `notify_one()` is executed. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait exits.

Note: 1. Calling this function if `lock.mutex()` is not locked by the current thread is undefined behavior.

A. Calling this function if `lock.mutex()` is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters `Mutex` – Type of mutex to wait on.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns *wait* returns *void*.

```
template<typename Mutex, typename Predicate>
```

```
inline void wait(std::unique_lock<Mutex> &lock, Predicate pred, error_code& = throws)
```

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (*bool(pred())==true*).

Equivalent to

```
while (!pred()) {
    wait(lock);
}
```

This overload may be used to ignore spurious awakenings while waiting for a specific condition to become true. Note that lock must be acquired before entering this method, and it is reacquired after *wait(lock)* exits, which means that lock can be used to guard access to *pred()*.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.

- A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.
-

Template Parameters

- **Mutex** – Type of mutex to wait on.
- **Predicate** – Type of predicate *pred* function.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **pred** – Predicate which returns *false* if the waiting should be continued (*bool(pred())==false*). The signature of the predicate function should be equivalent to the following: *bool pred();*

Returns *wait* returns *void*.

```
template<typename Mutex>
```

```
inline cv_status wait_until(std::unique_lock<Mutex> &lock, hpx::chrono::steady_time_point const  
&abs_time, error_code& ec = throws)
```

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (*bool(pred())==true*).

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when *notify_all()* or *notify_one()* is executed, or when the absolute time point *abs_time* is reached. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and *wait_until* exits.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.

- A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.
-

Template Parameters **Mutex** – Type of mutex to wait on.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **abs_time** – Represents the time when waiting should be stopped
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns *cv_status* *wait_until* returns *hpx::cv_status::timeout* if the absolute timeout specified by *abs_time* was reached and *hpx::cv_status::no_timeout* otherwise.

```
template<typename Mutex, typename Predicate>
inline bool wait_until(std::unique_lock<Mutex> &lock, hpx::chrono::steady_time_point const &abs_time, Predicate pred, error_code &ec = throws)
```

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (*bool(pred())==true*).

Equivalent to

```
while (!pred()) {
    if (wait_until(lock, abs_time) == hpx::cv_status::timeout) {
        return pred();
    }
}
return true;
```

This overload may be used to ignore spurious wakeups.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.
A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters

- **Mutex** – Type of mutex to wait on.
- **Predicate** – Type of predicate *pred* function.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **abs_time** – Represents the time when waiting should be stopped
- **pred** – Predicate which returns *false* if the waiting should be continued (*bool(pred())==false*). The signature of the predicate function should be equivalent to the following: *bool pred();*
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns *bool* *wait_until* returns *false* if the predicate *pred* still evaluates to *false* after the *abs_time* timeout has expired, otherwise *true*. If the timeout had already expired, evaluates and returns the result of *pred*.

```
template<typename Mutex>
inline cv_status wait_for(std::unique_lock<Mutex> &lock, hpx::chrono::steady_duration const &rel_time, error_code &ec = throws)
```

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when *notify_all()* or *notify_one()* is executed, or when the relative timeout *rel_time* expires. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and *wait_for()* exits.

The standard recommends that a steady clock be used to measure the duration. This function may block for longer than *rel_time* due to scheduling or resource contention delays.

-
- Note:**
1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.
 - A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.
 - B. Even if notified under lock, this overload makes no guarantees about the state of the associated predicate when returning due to timeout.
-

Template Parameters `Mutex` – Type of mutex to wait on.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **rel_time** – represents the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to *hpx::chrono::steady_clock::now()*.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns `cv_status hpx::cv_status::timeout` if the relative timeout specified by *rel_time* expired, `hpx::cv_status::no_timeout` otherwise.

```
template<typename Mutex, typename Predicate>
inline bool wait_for(std::unique_lock<Mutex> &lock, hpx::chrono::steady_duration const &rel_time,
                     Predicate pred, error_code &ec = throws)
```

Equivalent to.

```
return wait_until(lock,
                  hpx::chrono::steady_clock::now() + rel_time,
                  hpx::move(pred));
```

This overload may be used to ignore spurious awakenings by looping until some predicate is satisfied (`bool(pred())==true`).

The standard recommends that a steady clock be used to measure the duration. This function may block for longer than *rel_time* due to scheduling or resource contention delays.

-
- Note:**
1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.
 - A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.
-

Template Parameters

- **Mutex** – Type of mutex to wait on.
- **Predicate** – Type of predicate *pred* function.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **rel_time** – represents the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to *hpx::chrono::steady_clock::now()*.
- **pred** – Predicate which returns *false* if the waiting should be continued (`bool(pred())==false`). The signature of the predicate function should be equivalent to the following: `bool pred();`
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns bool *wait_for* returns *false* if the predicate pred still evaluates to *false* after the *rel_time* timeout expired, otherwise *true*.

Private Types

```
using mutex_type = lcos::local::detail::condition_variable_data::mutex_type
```

```
using data_type = hpx::intrusive_ptr<lcos::local::detail::condition_variable_data>
```

Private Members

```
hpx::util::cache_aligned_data_derived<data_type> data_
```

```
class condition_variable_any
```

#include <condition_variable.hpp> The `condition_variable_any` class is a generalization of `hpx::condition_variable`. Whereas `hpx::condition_variable` works only on `std::unique_lock<std::mutex>`, a `condition_variable_any` can operate on any lock that meets the `BasicLockable`⁷⁴³ requirements.

See `hpx::condition_variable` for the description of the semantics of condition variables. It is not `CopyConstructible`⁷⁴⁴, `MoveConstructible`⁷⁴⁵, `CopyAssignable`⁷⁴⁶, or `MoveAssignable`⁷⁴⁷.

Public Functions

```
inline condition_variable_any()
```

Constructs an object of type `hpx::condition_variable_any`.

```
~condition_variable_any() = default
```

Destroys the object of type `hpx::condition_variable_any`.

It is only safe to invoke the destructor if all threads have been notified. It is not required that they have exited their respective wait functions: some threads may still be waiting to reacquire the associated lock, or may be waiting to be scheduled to run after reacquiring it.

The programmer must ensure that no threads attempt to wait on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or are using the overloads of the wait functions that take a predicate.

Preconditions: There is no thread blocked on `*this`. [Note: That is, all threads have been notified; they could subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on `*this` once the destructor has been started, especially when the waiting threads are calling the `wait` functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. end note]

IOW, `~condition_variable_any()` can execute before a signaled thread returns from a wait. If this happens with `condition_variable_any`, that waiting thread will attempt to lock the destructed mutex. To fix this, there must be shared ownership of the data members between the `condition_variable_any` object and the member functions `wait` (`wait_for`, etc.).

```
condition_variable_any(condition_variable_any const&) = delete
```

```
condition_variable_any(condition_variable_any&&) = delete
condition_variable_any &operator=(condition_variable_any const&) = delete
condition_variable_any &operator=(condition_variable_any&&) = delete
inline void notify_one(error_code &ec = throws) const
```

If any threads are waiting on **this*, calling *notify_one* unblocks one of the waiting threads.

The notifying thread does not need to hold the lock on the same mutex as the one held by the waiting thread(s); in fact doing so is a pessimization, since the notified thread would immediately block again, waiting for the notifying thread to release the lock. However, some implementations (in particular many implementations of pthreads) recognize this situation and avoid this “hurry up and wait” scenario by transferring the waiting thread from the condition variable’s queue directly to the queue of the mutex within the notify call, without waking it up.

Notifying while under the lock may nevertheless be necessary when precise scheduling of events is required, e.g. if the waiting thread would exit the program if the condition is satisfied, causing destruction of the notifying thread’s condition variable. A spurious wakeup after mutex unlock but before notify would result in notify called on a destroyed object.

Note: The effects of *notify_one()*/*notify_all()* and each of the three atomic parts of *wait()*/*wait_for()*/*wait_until()* (unlock+wait wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a thread that started waiting just after the call to *notify_one()* was made.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to *throws*; A special ‘throw on error’ *error_code*.

Returns *notify_one* returns *void*.

```
inline void notify_all(error_code &ec = throws) const
```

Unblocks all threads currently waiting for **this*.

The notifying thread does not need to hold the lock on the same mutex as the one held by the waiting thread(s); in fact doing so is a pessimization, since the notified thread would immediately block again, waiting for the notifying thread to release the lock.

Note: The effects of *notify_one()*/*notify_all()* and each of the three atomic parts of *wait()*/*wait_for()*/*wait_until()* (unlock+wait wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a thread that started waiting just after the call to *notify_one()* was made.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to *throws*; A special ‘throw on error’ *error_code*.

Returns *notify_all* returns *void*.

```
template<typename Lock>
```

```
inline void wait(Lock &lock, error_code &ec = throws)
```

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (*bool(pred())==true*).

Atomically unlocks lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when `notify_all()` or `notify_one()` is executed. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait exits.

The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()`/`wait_for()`/`wait_until()` (`unlock+wait`, `wakeup`, and `lock`) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Note: If these functions fail to meet the postconditions (lock is locked by the calling thread), `std::terminate` is called. For example, this could happen if re-locking the mutex throws an exception.

Template Parameters **Lock** – Type of *lock*.

Parameters

- **lock** – An object of type Lock that meets the `BasicLockable`⁷⁴⁸ requirements, which must be locked by the current thread
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ `error_code`.

Returns `wait` returns `void`.

```
template<typename Lock, typename Predicate>
inline void wait(Lock &lock, Predicate pred, error_code& = throws)
```

`wait` causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred())==true`).

Equivalent to

```
while (!pred()) {
    wait(lock);
}
```

This overload may be used to ignore spurious awakenings while waiting for a specific condition to become true. Note that lock must be acquired before entering this method, and it is reacquired after `wait(lock)` exits, which means that lock can be used to guard access to `pred()`.

The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()`/`wait_for()`/`wait_until()` (`unlock+wait`, `wakeup`, and `lock`) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Note: If these functions fail to meet the postconditions (lock is locked by the calling thread), `std::terminate` is called. For example, this could happen if re-locking the mutex throws an exception.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type Lock that meets the `BasicLockable`⁷⁴⁹ requirements, which must be locked by the current thread

- **pred** – predicate which returns `false` if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred()`.

Returns `wait` returns `void`.

```
template<typename Lock>
inline cv_status wait_until(Lock &lock, hpx::chrono::steady_time_point const &abs_time, error_code &ec = throws)
```

`wait_until` causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred()) == true`).

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on `*this`. The thread will be unblocked when `notify_all()` or `notify_one()` is executed, or when the absolute time point `abs_time` is reached. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and `wait_until` exits.

Note: The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters `Lock` – Type of `lock`.

Parameters

- **lock** – an object of type `Lock` that meets the requirements of `BasicLockable`⁷⁵⁰, which must be locked by the current thread
- **abs_time** – represents the time when waiting should be stopped.
- **ec** – used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ `error_code`.

Returns `cv_status hpx::cv_status::timeout` if the absolute timeout specified by `abs_time` was reached, `hpx::cv_status::no_timeout` otherwise.

```
template<typename Lock, typename Predicate>
```

```
inline bool wait_until(Lock &lock, hpx::chrono::steady_time_point const &abs_time, Predicate pred, error_code &ec = throws)
```

`wait_until` causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred()) == true`).

Equivalent to

```
while (!pred()) {
    if (wait_until(lock, timeout_time) == hpx::cv_status::timeout) {
        return pred();
    }
}
return true;
```

This overload may be used to ignore spurious wakeups.

Note: The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that

can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type *Lock* that meets the requirements of `BasicLockable`⁷⁵¹, which must be locked by the current thread
- **abs_time** – represents the time when waiting should be stopped.
- **pred** – predicate which returns *false* if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ *error_code*.

Returns `bool false` if the predicate *pred* still evaluates to *false* after the *abs_time* timeout expired, otherwise true. If the timeout had already expired, evaluates and returns the result of *pred*.

```
template<typename Lock>
inline cv_status wait_for(Lock &lock, hpx::chrono::steady_duration const &rel_time, error_code &ec
= throws)
```

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when `notify_all()` or `notify_one()` is executed, or when the relative timeout *rel_time* expires. It may also be unblocked spuriously. When unblocked, regardless of the reason, *lock* is reacquired and `wait_for()` exits.

The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Note: Even if notified under lock, this overload makes no guarantees about the state of the associated predicate when returning due to timeout.

Template Parameters **Lock** – Type of *lock*.**Parameters**

- **lock** – an object of type *Lock* that meets the `BasicLockable`⁷⁵² requirements, which must be locked by the current thread.
- **rel_time** – an object of type `hpx::chrono::duration` representing the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ *error_code*.

Returns `cv_status hpx::cv_status::timeout` if the relative timeout specified by *rel_time* expired, `hpx::cv_status::no_timeout` otherwise.

```
template<typename Lock, typename Predicate>
inline bool wait_for(Lock &lock, hpx::chrono::steady_duration const &rel_time, Predicate pred,
error_code &ec = throws)
```

Equivalent to.

```
return wait_until(lock,
    hpx::chrono::steady_clock::now() + rel_time,
    std::move(pred));
```

This overload may be used to ignore spurious awakenings by looping until some predicate is satisfied (`bool(pred()) == true`).

Note: The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()`/`wait_for()`/`wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type *Lock* that meets the `BasicLockable`⁷⁵³ requirements, which must be locked by the current thread.
- **rel_time** – an object of type `hpx::chrono::duration` representing the maximum time to spend waiting. Note that `rel_time` must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.
- **pred** – predicate which returns *false* if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`.
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ `error_code`.

Returns `bool false` if the predicate *pred* still evaluates to *false* after the *rel_time* timeout expired, otherwise *true*.

template<typename **Lock**, typename **Predicate**>
 inline bool **wait**(*Lock* &*lock*, *stop_token* *stoken*, *Predicate* *pred*, *error_code* &*ec* = *throws*)
wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred())==true`).

An interruptible wait: registers the `condition_variable_any` for the duration of `wait()`, to be notified if a stop request is made on the given *stoken*’s associated stop-state; it is then equivalent to

```
while (!stoken.stop_requested()) {
    if (pred()) return true;
    wait(lock);
}
return pred();
```

Note that the returned value indicates whether *pred* evaluated to *true*, regardless of whether there was a stop requested or not.

Note: The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()`/`wait_for()`/`wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order.

der that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type *Lock* that meets the `BasicLockable`⁷⁵⁴ requirements, which must be locked by the current thread
- **stoken** – a `hpx::stop_token` to register interruption for
- **pred** – predicate which returns `false` if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred()`.
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ `error_code`.

Returns `bool` result of `pred()`.

```
template<typename Lock, typename Predicate>
inline bool wait_until(Lock &lock, stop_token stoken, hpx::chrono::steady_time_point const
&abs_time, Predicate pred, error_code &ec = throws)
```

`wait_until` causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred()) == true`).

An interruptible wait: registers the `condition_variable_any` for the duration of `wait_until()`, to be notified if a stop request is made on the given stoken’s associated stop-state; it is then equivalent to

```
while (!stoken.stop_requested()) {
    if (pred())
        return true;
    if (wait_until(lock, timeout_time) == hpx::cv_status::timeout)
        return pred();
}
return pred();
```

Note: The effects of `notify_one()`/`notify_all()` and each of the three atomic parts of `wait()`/`wait_for()`/`wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type *Lock* that meets the requirements of `BasicLockable`⁷⁵⁵, which must be locked by the current thread.
- **stoken** – a `hpx::stop_token` to register interruption for.
- **abs_time** – represents the time when waiting should be stopped.
- **pred** – predicate which returns `false` if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`

- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns bool *pred()*, regardless of whether the timeout was met or stop was requested.

```
template<typename Lock, typename Predicate>
inline bool wait_for(Lock &lock, stop_token stoken, hpx::chrono::steady_duration const &rel_time,
                     Predicate pred, error_code &ec = throws)
```

Equivalent to.

```
return wait_until(lock, std::move(stoken),
                  hpx::chrono::steady_clock::now() + rel_time,
                  std::move(pred));
```

Note: The effects of *notify_one()*/*notify_all()* and each of the three atomic parts of *wait()*/*wait_for()*/*wait_until()* (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a thread that started waiting just after the call to *notify_one()* was made.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type *Lock* that meets the *BasicLockable*⁷⁵⁶ requirements, which must be locked by the current thread.
- **stoken** – a *hpx::stop_token* to register interruption for.
- **rel_time** – an object of type *hpx::chrono::duration* representing the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to *hpx::chrono::steady_clock::now()*.
- **pred** – predicate which returns *false* if the waiting should be continued (bool(*pred()*) == *false*). The signature of the predicate function should be equivalent to the following: bool *pred()*;
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns bool *pred()*, regardless of whether the timeout was met or stop was requested.

hpx::counting_semaphore

Defined in header `hpx/semaphore.hpp`⁷⁵⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

```
template<std::ptrdiff_t Least.MaxValue = PTRDIFF_MAX>
```

```
class counting_semaphore
```

```
#include <counting_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

⁷⁵⁷ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/semaphore.hpp

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike `hpx::mutex` a `counting_semaphore` is not tied to threads of execution — acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on `counting_semaphore` can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of `hpx::counting_semaphore` are not `DefaultConstructible`⁷⁵⁸, `CopyConstructible`⁷⁵⁹, `MoveConstructible`⁷⁶⁰, `CopyAssignable`⁷⁶¹, or `MoveAssignable`⁷⁶².

Note: `counting_semaphore`'s `try_acquire()` can spuriously fail.

Template Parameters `Least.MaxValue` – `counting_semaphore` allows more than one concurrent access to the same resource, for at least `Least.MaxValue` concurrent accessors. As its name indicates, the `Least.MaxValue` is the minimum max value, not the actual max value. Thus `max()` can yield a number larger than `Least.MaxValue`.

Public Functions

```
counting_semaphore(counting_semaphore const&) = delete
counting_semaphore &operator=(counting_semaphore const&) = delete
counting_semaphore(counting_semaphore&&) = delete
counting_semaphore &operator=(counting_semaphore&&) = delete
explicit counting_semaphore(std::ptrdiff_t value)
Constructs an object of type hpx::counting_semaphore with the internal counter initialized to value.
Parameters value – The initial value of the internal semaphore lock count. Normally this value should be zero (which is the default), values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set.
~counting_semaphore() = default
void release(std::ptrdiff_t update = 1)
Atomically increments the internal counter by the value of update. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in acquire, will subsequently be unblocked.
```

Note: Synchronization: Strongly happens before invocations of `try_acquire` that observe the result of the effects.

Throws `std::system_error` –
Parameters `update` – the amount to increment the internal counter by
Pre Both `update >= 0` and `update <= max()` – `counter` are *true*, where `counter` is the value of the internal counter.

`bool try_acquire() noexcept`

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

Returns *true* if it decremented the internal counter, otherwise *false*

`void acquire()`

Repeatedly performs the following steps, in order:

- Evaluates `try_acquire`. If the result is true, returns.
- Blocks on `*this` until counter is greater than zero.

Throws `std::system_error` –
Returns `void`.

`bool try_acquire_until(hpx::chrono::steady_time_point const &abs_time)`

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the `abs_time` time point has been passed.

Parameters `abs_time` – the earliest time the function must wait until in order to fail
Throws `std::system_error` –
Returns *true* if it decremented the internal counter, otherwise *false*.

`bool try_acquire_for(hpx::chrono::steady_duration const &rel_time)`

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the `rel_time` duration has been exceeded.

Throws `std::system_error` –
Parameters `rel_time` – the minimum duration the function must wait for to fail
Returns *true* if it decremented the internal counter, otherwise false

Public Static Functions

`static constexpr std::ptrdiff_t max() noexcept`

Returns The maximum value of counter. This value is greater than or equal to *Least.MaxValue*.

Returns The internal counter's maximum possible value, as a `std::ptrdiff_t`.

`template<typename Mutex = hpx::spinlock, int N = 0>`

`class counting_semaphore_var`

`#include <counting_semaphore.hpp>` A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this

semaphore. Unlike `hpx::mutex` a `counting_semaphore_var` is not tied to threads of execution — acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on `counting_semaphore_var` can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template `counting_semaphore_var` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of `hpx::counting_semaphore_var` are not `DefaultConstructible`⁷⁶³, `CopyConstructible`⁷⁶⁴, `MoveConstructible`⁷⁶⁵, `CopyAssignable`⁷⁶⁶, or `MoveAssignable`⁷⁶⁷.

Note: `counting_semaphore_var`'s `try_acquire()` can spuriously fail.

Template Parameters

- **Mutex** – Type of mutex
- **N** – The initial value of the internal semaphore lock count.

Public Functions

explicit `counting_semaphore_var`(`std::ptrdiff_t` value = `N`)

Constructs an object of type `hpx::counting_semaphore_value` with the internal counter initialized to `N`.

Parameters `value` – The initial value of the internal semaphore lock count. Normally this value should be zero, values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set. Defaults to `N` (which in turn defaults to zero).

`counting_semaphore_var`(`counting_semaphore_var const&`) = delete

`counting_semaphore_var &operator=(``counting_semaphore_var const&`) = delete

`void wait`(`std::ptrdiff_t` count = 1)

Wait for the semaphore to be signaled.

Parameters `count` – The value by which the internal lock count will be decremented. At the same time this is the minimum value of the lock count at which the thread is not yielded.

`bool try_wait`(`std::ptrdiff_t` count = 1)

Try to wait for the semaphore to be signaled.

Parameters `count` – The value by which the internal lock count will be decremented. At the same time this is the minimum value of the lock count at which the thread is not yielded.

Returns `try_wait` returns true if the calling thread was able to acquire the requested amount of credits. `try_wait` returns false if not sufficient credits are available at this point in time.

```
void signal(std::ptrdiff_t count = 1)
```

Signal the semaphore.

Parameters **count** – The value by which the internal lock count will be incremented.

```
std::ptrdiff_t signal_all()
```

Unblock all acquirers.

Returns *std*::ptrdiff_t internal lock count after the operation.

```
void release(std::ptrdiff_t update = 1)
```

Atomically increments the internal counter by the value of update. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in acquire, will subsequently be unblocked.

Note: Synchronization: Strongly happens before invocations of *try_acquire* that observe the result of the effects.

Throws *std*::system_error –

Parameters **update** – the amount to increment the internal counter by

Pre Both update ≥ 0 and update $\leq \max()$ – counter are true, where counter is the value of the internal counter.

```
bool try_acquire() noexcept
```

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

Returns *true* if it decremented the internal counter, otherwise *false*

```
void acquire()
```

Repeatedly performs the following steps, in order:

- Evaluates try_acquire. If the result is true, returns.

Blocks on *this until counter is greater than zero.

Throws *std*::system_error –

Returns void.

```
bool try_acquire_until(hpx::chrono::steady_time_point const &abs_time)
```

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *abs_time* time point has been passed.

Parameters **abs_time** – the earliest time the function must wait until in order to fail

Throws *std*::system_error –

Returns *true* if it decremented the internal counter, otherwise *false*.

```
bool try_acquire_for(hpx::chrono::steady_duration const &rel_time)
```

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *rel_time* duration has been exceeded.

Throws *std*::system_error –

Parameters **rel_time** – the minimum duration the function must wait for to fail

Returns *true* if it decremented the internal counter, otherwise false

Public Static Functions

```
static constexpr std::ptrdiff_t max() noexcept
```

Returns The maximum value of counter. This value is greater than or equal to *Least.MaxValue*.

Returns The internal counter's maximum possible value, as a *std::ptrdiff_t*.

Private Types

```
using mutex_type = Mutex

hpx::latch

Defined in header *hpx/latch.hpp*⁷⁶⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

class **latch**

#include <latch.hpp> Latches are a thread coordination mechanism that allow one or more threads to block until an operation is completed. An individual latch is a single-use object; once the operation has been completed, the latch cannot be reused.

Subclassed by *hpx::lcos::local::latch*

⁷⁶⁸ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/latch.hpp>

Public Functions

latch(*latch* const&) = delete

latch(*latch*&&) = delete

***latch* &**operator=**(*latch* const&)** = delete

***latch* &**operator=**(*latch*&&)** = delete

inline explicit **latch(*std*::ptrdiff_t count)**

Initialize the latch

Requires: count ≥ 0 . Synchronization: None Postconditions: counter_ == count.

~latch() = default

Requires: No threads are blocked at the synchronization point.

Note: May be called even if some threads have not yet returned from [wait\(\)](#) or [count_down_and_wait\(\)](#), provided that counter_ is 0.

Note: The destructor might not return until all threads have exited [wait\(\)](#) or [count_down_and_wait\(\)](#).

Note: It is the caller's responsibility to ensure that no other thread enters [wait\(\)](#) after one thread has called the destructor. This may require additional coordination.

inline void **count_down(*std*::ptrdiff_t update)**

Decrements counter_ by n. Does not block.

Requires: counter_ $\geq n$ and $n \geq 0$.

Synchronization: Synchronizes with all calls that block on this latch and with all try_wait calls on this latch that return true .

Throws Nothing. –

inline bool **try_wait()** const noexcept

Returns: With very low probability false. Otherwise counter == 0.

inline void **wait()** const

If counter_ is 0, returns immediately. Otherwise, blocks the calling thread at the synchronization point until counter_ reaches 0.

Throws Nothing. –

inline void **arrive_and_wait(*std*::ptrdiff_t update = 1)**

Effects: Equivalent to: count_down(update); [wait\(\)](#);

```

```
class latch : public hpx::latch
```

#include <latch.hpp> A latch maintains an internal counter_ that is initialized when the latch is created. Threads may block at a synchronization point waiting for counter_ to be decremented to 0. When counter_ reaches 0, all such blocked threads are released.

Calls to `countdown_and_wait()`, `count_down()`, `wait()`, `is_ready()`, `count_up()`, and `reset()` behave as atomic operations.

Note: A `hpx::latch` is not an LCO in the sense that it has no global id and it can't be triggered using the action (parcel) mechanism. Use `hpx::distributed::latch` instead if this is required. It is just a low level synchronization primitive allowing to synchronize a given number of *threads*.

Public Functions

```
HPX_NON_COPYABLE(latch)
```

```
inline explicit latch(std::ptrdiff_t count)
```

Initialize the latch

Requires: `count >= 0`. Synchronization: None Postconditions: `counter_ == count`.

`~latch()` = default

Requires: No threads are blocked at the synchronization point.

Note: May be called even if some threads have not yet returned from `wait()` or `count_down_and_wait()`, provided that counter_ is 0.

Note: The destructor might not return until all threads have exited `wait()` or `count_down_and_wait()`.

Note: It is the caller's responsibility to ensure that no other thread enters `wait()` after one thread has called the destructor. This may require additional coordination.

`inline void count_down_and_wait()`

Decrements counter_ by 1 . Blocks at the synchronization point until counter_ reaches 0.

Requires: counter_ > 0.

Synchronization: Synchronizes with all calls that block on this latch and with all is_ready calls on this latch that return true.

Throws Nothing. –

`inline bool is_ready() const noexcept`

Returns: counter_ == 0. Does not block.

Throws Nothing. –

`inline void abort_all() const`**`inline void count_up(std::ptrdiff_t n)`**

Increments counter_ by n. Does not block.

Requires: n >= 0.

Throws Nothing. –

`inline void reset(std::ptrdiff_t n)`

Reset counter_ to n. Does not block.

Requires: n >= 0.

Throws Nothing. –

`inline bool reset_if_needed_and_count_up(std::ptrdiff_t n, std::ptrdiff_t count)`

Effects: Equivalent to: if (`is_ready()`) `reset(count)`; `count_up(n)`; Returns: true if the latch was reset

hpx::mutex, hpx::timed_mutex

Defined in header `hpx/mutex.hpp`⁷⁶⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

class mutex

`#include <mutex.hpp>` *mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. *mutex* offers exclusive, non-recursive ownership semantics:

- A calling thread owns a *mutex* from the time that it successfully calls either *lock* or *try_lock* until it calls *unlock*.
- When a thread owns a *mutex*, all other threads will block (for calls to *lock*) or receive a *false* return value (for *try_lock*) if they attempt to claim ownership of the *mutex*.
- A calling thread must not own the *mutex* prior to calling *lock* or *try_lock*.

The behavior of a program is undefined if a *mutex* is destroyed while still owned by any threads, or a thread terminates while owning a *mutex*. The *mutex* class satisfies all requirements of *Mutex*⁷⁷⁰ and *StandardLayoutType*⁷⁷¹.

`hpx::mutex` is neither copyable nor movable.

Subclassed by `hpx::timed_mutex`

Public Functions

HPX_NON_COPYABLE(*mutex*)

`hpx::mutex` is neither copyable nor movable

inline HPX_HOST_DEVICE_CONSTEXPR **mutex**(char const*const = "") noexcept

Constructs the *mutex*. The *mutex* is in unlocked state after the constructor completes.

Note: Because the default constructor is *constexpr*, static mutexes are initialized as part of static non-local initialization, before any dynamic non-local initialization begins. This makes it safe to lock a *mutex* in a constructor of any static object.

Parameters **description** – description of the *mutex*.

~mutex()

Destroys the *mutex*. The behavior is undefined if the *mutex* is owned by any thread or if any thread terminates while holding any ownership of the *mutex*.

void **lock**(char const *description, *error_code* &ec = *throws*)

Locks the *mutex*. If another thread has already locked the *mutex*, a call to *lock* will block execution until the lock is acquired. If *lock* is called by a thread that already owns the *mutex*, the behavior is undefined: for example, the program may deadlock. `hpx::mutex` can detect the invalid usage and

⁷⁶⁹ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/mutex.hpp

throws a `std::system_error` with error condition `resource_deadlock_would_occur` instead of deadlock-ing. Prior `unlock()` operations on the same mutex synchronize- with (as defined in `std::memory_order`) this operation.

Note: `lock()` is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking.

Parameters

- **description** – Description of the `mutex`
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ `error_code`.

Returns void `lock` returns `void`.

inline void **lock**(`error_code` &`ec` = `throws`)

Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. `hpx::mutex` can detect the invalid usage and throws a `std::system_error` with error condition `resource_deadlock_would_occur` instead of deadlock-ing. Prior `unlock()` operations on the same mutex synchronize - with(as defined in `std::memory_order`) this operation.

Note: `lock()` is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking. This overload essentially calls `void lock(char const* description, error_code& ec = throws);` with `description` as `mutex::lock`.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ `error_code`.

Returns void `lock` returns `void`.

bool **try_lock**(`char const *description, error_code` &`ec` = `throws`)

Tries to lock the `mutex`. Returns immediately. On successful lock acquisition returns `true`, otherwise returns `false`. This function is allowed to fail spuriously and return `false` even if the `mutex` is not currently locked by any other thread. If `try_lock` is called by a thread that already owns the `mutex`, the behavior is undefined. Prior `unlock()` operation on the same mutex synchronizes-with (as defined in `std::memory_order`) this operation if it returns `true`. Note that prior `lock()` does not synchronize with this operation if it returns `false`.

Parameters

- **description** – Description of the `mutex`
- **ec** – Used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ `error_code`.

Returns bool `try_lock` returns `true` on successful lock acquisition, otherwise returns `false`.

inline bool **try_lock**(`error_code` &`ec` = `throws`)

Tries to lock the `mutex`. Returns immediately. On successful lock acquisition returns `true`, otherwise returns `false`. This function is allowed to fail spuriously and return `false` even if the `mutex` is not currently locked by any other thread. If `try_lock` is called by a thread that already owns the `mutex`, the behavior is undefined. Prior `unlock()` operation on the same mutex synchronizes-with (as defined in `std::memory_order`) this operation if it returns `true`. Note that prior `lock()` does not synchronize with this operation if it returns `false`.

Note: This overload essentially calls

```
void try_lock(char const* description,
             error_code& ec = throws);
```

with *description* as *mutex*::*try_lock*.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to *throws*; A special ‘throw on error’ *error_code*.

Returns bool *try_lock* returns *true* on successful lock acquisition, otherwise returns *false*.

```
void unlock(error_code &ec = throws)
```

Unlocks the *mutex*. The *mutex* must be locked by the current thread of execution, otherwise, the behavior is undefined. This operation *synchronizes-with* (as defined in *std::memory_order*) any subsequent *lock* operation that obtains ownership of the same *mutex*.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to *throws*; A special ‘throw on error’ *error_code*.

Returns *unlock* returns *void*.

```
class timed_mutex : private hpx::mutex
```

#include <mutex.hpp> The *timed_mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In a manner similar to *mutex*, *timed_mutex* offers exclusive, non-recursive ownership semantics. In addition, *timed_mutex* provides the ability to attempt to claim ownership of a *timed_mutex* with a timeout via the member functions *try_lock_for()* and *try_lock_until()*. The *timed_mutex* class satisfies all requirements of *TimedMutex*⁷⁷² and *StandardLayoutType*⁷⁷³.

hpx::timed_mutex is neither copyable nor movable.

Public Functions

HPX_NON_COPYABLE(*timed_mutex*)

hpx::timed_mutex is neither copyable nor movable

timed_mutex(char const *const *description* = "")

Constructs a *timed_mutex*. The mutex is in unlocked state after the call.

Parameters **description** – Description of the *timed_mutex*.

~timed_mutex()

Destroys the *timed_mutex*. The behavior is undefined if the mutex is owned by any thread or if any thread terminates while holding any ownership of the mutex.

```
bool try_lock_until(hpx::chrono::steady_time_point const &abs_time, char const *description,
                     error_code &ec = throws)
```

Tries to lock the mutex. Blocks until specified *abs_time* has been reached or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *abs_time* has already passed, this function behaves like *try_lock()*. As with *try_lock()*, this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point before *abs_time*. Prior *unlock()* operation on the same mutex *synchronizes-with* (as defined in *std::memory_order*) this operation if it returns *true*. If *try_lock_until* is called by a thread that already owns the mutex, the behavior is undefined.

Parameters

- **abs_time** – time point to block until
- **description** – Description of the *timed_mutex*

- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns bool *try_lock_until* returns *true* if the lock was acquired successfully, otherwise *false*.

```
inline bool try_lock_until(hpx::chrono::steady_time_point const &abs_time, error_code &ec = throws)
```

Tries to lock the mutex. Blocks until specified *abs_time* has been reached or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *abs_time* has already passed, this function behaves like *try_lock()*. As with *try_lock()*, this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point before *abs_time*. Prior *unlock()* operation on the same mutex *synchronizes-with* (as defined in *std::memory_order*) this operation if it returns *true*. If *try_lock_until* is called by a thread that already owns the mutex, the behavior is undefined.

Note: This overload essentially calls

```
bool try_lock_until(
    hpx::chrono::steady_time_point const& abs_time,
    char const* description, error_code& ec = throws);
```

with *description* as *mutex::try_lock_until*.

Parameters

- **abs_time** – time point to block until
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns bool *try_lock_until* returns *true* if the lock was acquired successfully, otherwise *false*.

```
inline bool try_lock_for(hpx::chrono::steady_duration const &rel_time, char const *description,
                        error_code &ec = throws)
```

Tries to lock the mutex. Blocks until specified *rel_time* has elapsed or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *rel_time* is less or equal *rel_time.zero()*, the function behaves like *try_lock()*. This function may block for longer than *rel_time* due to scheduling or resource contention delays. As with *try_lock()*, this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point during *rel_time*. Prior *unlock()* operation on the same mutex *synchronizes-with* (as defined in *std::memory_order*) this operation if it returns *true*. If *try_lock_for* is called by a thread that already owns the mutex, the behavior is undefined.

Parameters

- **rel_time** – minimum duration to block for
- **description** – Description of the *timed_mutex*
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns bool *try_lock_for* returns *true* if the lock was acquired successfully, otherwise *false*.

```
inline bool try_lock_for(hpx::chrono::steady_duration const &rel_time, error_code &ec = throws)
```

Tries to lock the mutex. Blocks until specified *rel_time* has elapsed or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *rel_time* is less or equal *rel_time.zero()*, the function behaves like *try_lock()*. This function may block for longer than *rel_time* due to scheduling or resource contention delays. As with *try_lock()*, this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point during *rel_time*. Prior *unlock()* operation on the same mutex *synchronizes-with* (as defined in

`std::memory_order)` this operation if it returns *true*. If `try_lock_for` is called by a thread that already owns the mutex, the behavior is undefined.

Note: This overload essentially calls

```
bool try_lock_for(  
    hpx::chrono::steady_duration const& rel_time,  
    char const* description, error_code& ec = throws)
```

with *description* as `mutex::try_lock_for`.

Parameters

- `rel_time` – minimum duration to block for
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ `error_code`.

Returns `bool try_lock_for` returns *true* if the lock was acquired successfully, otherwise *false*.

`void lock(char const *description, error_code &ec = throws)`

Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. `hpx::mutex` can detect the invalid usage and throws a `std::system_error` with error condition `resource_deadlock_would_occur` instead of deadlock-ing. Prior `unlock()` operations on the same mutex synchronize- with (as defined in `std::memory_order`) this operation.

Note: `lock()` is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking.

Parameters

- `description` – Description of the *mutex*
- `ec` – Used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ `error_code`.

Returns `void lock` returns `void`.

`inline void lock(error_code &ec = throws)`

Locks the mutex. If another thread has already locked the mutex, a call to lock will block execution until the lock is acquired. If lock is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. `hpx::mutex` can detect the invalid usage and throws a `std::system_error` with error condition `resource_deadlock_would_occur` instead of deadlock-ing. Prior `unlock()` operations on the same mutex synchronize - with(as defined in `std::memory_order`) this operation.

Note: `lock()` is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking. This overload essentially calls `void lock(char const* description, error_code& ec =throws);` with *description* as `mutex::lock`.

Parameters `ec` – Used to hold error code value originated during the operation. Defaults to `throws` — A special ‘throw on error’ `error_code`.

Returns `void lock` returns `void`.

`bool try_lock(char const *description, error_code &ec = throws)`

Tries to lock the *mutex*. Returns immediately. On successful lock acquisition returns *true*, otherwise

returns *false*. This function is allowed to fail spuriously and return *false* even if the *mutex* is not currently locked by any other thread. If *try_lock* is called by a thread that already owns the *mutex*, the behavior is undefined. Prior *unlock()* operation on the same mutex synchronizes-with (as defined in *std::memory_order*) this operation if it returns *true*. Note that prior *lock()* does not synchronize with this operation if it returns *false*.

Parameters

- **description** – Description of the *mutex*
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns bool *try_lock* returns *true* on successful lock acquisition, otherwise returns *false*.

inline bool **try_lock(error_code &ec = throws)**

Tries to lock the *mutex*. Returns immediately. On successful lock acquisition returns *true*, otherwise returns *false*. This function is allowed to fail spuriously and return *false* even if the *mutex* is not currently locked by any other thread. If *try_lock* is called by a thread that already owns the *mutex*, the behavior is undefined. Prior *unlock()* operation on the same mutex synchronizes-with (as defined in *std::memory_order*) this operation if it returns *true*. Note that prior *lock()* does not synchronize with this operation if it returns *false*.

Note: This overload essentially calls

```
void try_lock(char const* description,
           error_code& ec = throws);
```

with *description* as *mutex::try_lock*.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns bool *try_lock* returns *true* on successful lock acquisition, otherwise returns *false*.

void **unlock(error_code &ec = throws)**

Unlocks the *mutex*. The *mutex* must be locked by the current thread of execution, otherwise, the behavior is undefined. This operation *synchronizes-with* (as defined in *std::memory_order*) any subsequent *lock* operation that obtains ownership of the same *mutex*.

Parameters **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns *unlock* returns *void*.

TypeDefs

```
using thread_id_ref_type = thread_id_ref
```

```
using thread_self = coroutines::detail::coroutine_self
```

Functions

```
thread_id get_self_id() noexcept
```

The function *get_self_id* returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

```
thread_self *get_self_ptr() noexcept
```

The function *get_self_ptr* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

hpx::no_mutex

Defined in header `hpx/mutex.hpp`⁷⁷⁴.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

```
struct no_mutex
```

#include <no_mutex.hpp> **no_mutex** class can be used in cases where the shared data between multiple threads can be accessed simultaneously without causing inconsistencies.

hpx::once_flag, hpx::call_once

Defined in header `hpx/mutex.hpp`⁷⁷⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

Defines

HPX_ONCE_INIT

namespace **hpx**

Functions

```
template<typename F, typename ...Args>
void call_once(once_flag &flag, F &&f, Args&&... args)
```

Executes the Callable object *f* exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time *call_once* is called, flag indicates that *f* was already called, *call_once* returns right away (such a call to *call_once* is known as passive).
- Otherwise, *call_once* invokes `std::forward<Callable>(f)` with the arguments `std::forward<Args>(args)...` (as if by `hpx::invoke`). Unlike the `hpx::thread` constructor or `hpx::async`, the arguments are not moved or copied because they don't need to be transferred to another thread of execution. (such a call to *call_once* is known as active).
 - If that invocation throws an exception, it is propagated to the caller of *call_once*, and the flag is not flipped so that another call will be attempted (such a call to *call_once* is known as exceptional).
 - If that invocation returns normally (such a call to *call_once* is known as returning), the flag is flipped, and all other calls to *call_once* with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to *call_once* are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

Note: If concurrent calls to *call_once* pass different functions *f*, it is unspecified which *f* will be called. The selected function runs in the same thread as the *call_once* invocation it was passed to. Initialization of function-local statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using `hpx::call_once`. The POSIX equivalent of this function is `pthread_once`.

Parameters

- **flag** – an object, for which exactly one function gets executed
- **f** – Callable object to invoke

⁷⁷⁵ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/mutex.hpp

- **args** – arguments to pass to the function

Throws `std::system_error` – if any condition prevents calls to `call_once` from executing as specified or any exception thrown by `f`

struct `once_flag`

`#include <once.hpp>` The class `hpx::once_flag` is a helper structure for `hpx::call_once`. An object of type `hpx::once_flag` that is passed to multiple calls to `hpx::call_once` allows those calls to coordinate with each other such that only one of the calls will actually run to completion. `hpx::once_flag` is neither copyable nor movable.

Public Functions

`HPX_NON_COPYABLE(once_flag)`

inline `once_flag()` noexcept

Constructs an `once_flag` object. The internal state is set to indicate that no function has been called yet.

Private Members

`std::atomic<long> status_`

`lcos::local::event event_`

Friends

template<typename F, typename ...Args>

friend void `call_once(once_flag &flag, F &&f, Args&&... args)`

Executes the Callable object `f` exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time `call_once` is called, flag indicates that `f` was already called, `call_once` returns right away (such a call to `call_once` is known as passive).
- Otherwise, `call_once` invokes `std::forward<Callable>(f)` with the arguments `std::forward<Args>(args)...` (as if by `hpx::invoke`). Unlike the `hpx::thread` constructor or `hpx::async`, the arguments are not moved or copied because they don't need to be transferred to another thread of execution. ```

namespace **lcos**

namespace **local**

⁷⁷⁶ http://github.com/STEllAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/mutex.hpp

hpx::shared_mutex

Defined in header `hpx/shared_mutex.hpp`⁷⁷⁷.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

TypeDefs

```
using shared_mutex = detail::shared_mutex<>;
```

The *shared_mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In contrast to other mutex types which facilitate exclusive access, a *shared_mutex* has two levels of access:

- *shared* - several threads can share ownership of the same mutex.
- *exclusive* - only one thread can own the mutex.

If one thread has acquired the exclusive lock (through *lock*, *try_lock*), no other threads can acquire the lock (including the shared). If one thread has acquired the shared lock (through *lock_shared*, *try_lock_shared*), no other thread can acquire the exclusive lock, but can acquire the shared lock. Only when the exclusive lock has not been acquired by any thread, the shared lock can be acquired by multiple threads. Within one thread, only one lock (shared or exclusive) can be acquired at the same time. Shared mutexes are especially useful when shared data can be safely read by any number of threads simultaneously, but a thread may only write the same data when no other thread is reading or writing at the same time. The *shared_mutex* class satisfies all requirements of *SharedMutex* and *StandardLayoutType*.

namespace **lcos**

 namespace **local**

hpx/synchronization/sliding_semaphore.hpp

Defined in header `hpx/synchronization/sliding_semaphore.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

⁷⁷⁷ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/shared_mutex.hpp

Typedefs

```
using sliding_semaphore = sliding_semaphore_var<>
```

```
template<typename Mutex = hpx::spinlock>
```

```
class sliding_semaphore_var
```

#include <sliding_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Sliding semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. The difference to a counting semaphore is that a sliding semaphore will not limit the number of threads which are allowed to proceed, but will make sure that the difference between the (arbitrary) number passed to set and wait does not exceed a given threshold.

Public Functions

```
sliding_semaphore_var(sliding_semaphore_var const&) = delete
```

```
sliding_semaphore_var &operator=(sliding_semaphore_var const&) = delete
```

```
sliding_semaphore_var(sliding_semaphore_var&&) = delete
```

```
sliding_semaphore_var &operator=(sliding_semaphore_var&&) = delete
```

```
inline explicit sliding_semaphore_var(std::int64_t max_difference, std::int64_t lower_limit = 0)  
    noexcept
```

Construct a new sliding semaphore.

Parameters

- **max_difference** – [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower_limit** – [in] The initial lower limit.

```
inline void set_max_difference(std::int64_t max_difference, std::int64_t lower_limit = 0) noexcept
```

Set/Change the difference that will cause the semaphore to trigger

Parameters

- **max_difference** – [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower_limit** – [in] The initial lower limit.

```
inline void wait(std::int64_t upper_limit)
```

Wait for the semaphore to be signaled.

Parameters **upper_limit** – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by *signal()* is larger than the max_difference.

```
inline bool try_wait(std::int64_t upper_limit = 1)
```

Try to wait for the semaphore to be signaled.

Parameters **upper_limit** – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by *signal()* is larger than the max_difference.

Returns The function returns true if the calling thread would not block if it was calling *wait()*.

```
inline void signal(std::int64_t lower_limit)
```

Signal the semaphore.

Parameters **lower_limit** – [in] The new lower limit. This will update the current lower limit of this semaphore. It will also re-schedule all suspended threads for which their associated upper limit is not larger than the lower limit plus the max_difference.

```
inline std::int64_t signal_all()
```

TypeDefs

```
using spinlock = detail::spinlock<true>
```

`spinlock` is a type of lock that causes a thread attempting to obtain it to check for its availability while waiting in a loop continuously.

```
using spinlock_no_backoff = detail::spinlock<false>
```

namespace **lcos**

namespace **local**

hpx::nostopstate, **hpx::stop_callback**, **hpx::stop_source**, **hpx::stop_token**, **hpx::nostopstate_t**

Defined in header `hpx/stop_token.hpp`⁷⁷⁹.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename Callback>
stop_callback(stop_token, Callback) -> stop_callback<Callback>
```

The `stop_callback` class template provides an RAII object type that registers a callback function for an associated `hpx::stop_token` object, such that the callback function will be invoked when the `hpx::stop_token`'s associated `hpx::stop_source` is requested to stop. Callback functions registered via `stop_callback`'s constructor are invoked either in the same thread that successfully invokes `request_stop()` for a `hpx::stop_source` of the `stop_callback`'s associated `hpx::stop_token`; or if stop has already been requested prior to the constructor's registration, then the callback is invoked in the thread constructing the `stop_callback`. More than one `stop_callback` can be created for the same `hpx::stop_token`, from the same or different threads concurrently. No guarantee is provided for the order in which they will be executed, but they will be invoked synchronously; except for `stop_callback(s)` constructed after stop has already been requested for the `hpx::stop_token`, as described previously. If an invocation of a callback exits via an exception then `hpx::terminate` is called. `hpx::stop_callback` is not *CopyConstructible*, *CopyAssignable*, *MoveConstructible*, nor *MoveAssignable*. The template param `Callback` type must be both *invocable* and *destructible*. Any return value is ignored.

```
inline void swap(stop_token &lhs, stop_token &rhs) noexcept
```

```
inline void swap(stop_source &lhs, stop_source &rhs) noexcept
```

⁷⁷⁹ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/stop_token.hpp

Variables

```
constexpr nostopstate_t nostopstate = {}
```

This is a constant object instance of `hpx::nostopstate_t` for use in constructing an empty `hpx::stop_source`, as a placeholder value in the non-default constructor.

```
struct nostopstate_t
```

`#include <stop_token.hpp>` Unit type intended for use as a placeholder in `hpx::stop_source` non-default constructor, that makes the constructed `hpx::stop_source` empty with no associated stop-state.

Public Functions

```
explicit nostopstate_t() = default
```

```
template<typename Callback>
```

```
class stop_callback
```

```
class stop_source
```

`#include <stop_token.hpp>` The `stop_source` class provides the means to issue a stop request, such as for `hpx::jthread` cancellation. A stop request made for one `stop_source` object is visible to all `stop_sources` and `hpx::stop_tokens` of the same associated stop-state; any `hpx::stop_callback(s)` registered for associated `hpx::stop_token(s)` will be invoked, and any `hpx::condition_variable_any` objects waiting on associated `hpx::stop_token(s)` will be awoken. Once a stop is requested, it cannot be withdrawn. Additional stop requests have no effect.

Note: For the purposes of `hpx::jthread` cancellation the `stop_source` object should be retrieved from the `hpx::jthread` object using `get_stop_source()`; or stop should be requested directly from the `hpx::jthread` object using `request_stop()`. This will then use the same associated stop-state as that passed into the `hpx::jthread`'s invoked function argument (i.e., the function being executed on its thread). For other uses, however, a `stop_source` can be constructed separately using the default constructor, which creates new stop-state.

Public Functions

```
inline stop_source()
```

```
inline explicit stop_source(nostopstate_t) noexcept
```

```
inline stop_source(stop_source const &rhs) noexcept
```

```
stop_source(stop_source&&) noexcept = default
```

```

inline friend bool operator!=(stop_source const &lhs, stop_source const &rhs) noexcept

```

class **stop_token**

#include <*stop_token.hpp*> The *stop_token* class provides the means to check if a stop request has been made or can be made, for its associated *hpx::stop_source* object. It is essentially a thread-safe “view” of the associated stop-state. The *stop_token* can also be passed to the constructor of *hpx::stop_callback*, such that the callback will be invoked if the *stop_token*’s associated *hpx::stop_source* is requested to stop. And *stop_token* can be passed to the interruptible waiting functions of *hpx::condition_variable_any*, to interrupt the condition variable’s wait if stop is requested.

Note: A *stop_token* object is not generally constructed independently, but rather retrieved from a *hpx::jthread* or *hpx::stop_source*. This makes it share the same associated stop-state as the *hpx::jthread* or *hpx::stop_source*.

Defined in header `hpx/thread_pool_util/thread_pool_suspension_helpers.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **threads**

Functions

`hpx::future<void> resume_processing_unit(thread_pool_base &pool, std::size_t virt_core)`

Resumes the given processing unit. When the processing unit has been resumed the returned future will be ready.

Note: Can only be called from an HPX thread. Use `resume_processing_unit_cb` or to resume the processing unit from outside HPX. Requires that the pool has `threads::policies::enable_elasticity` set.

Parameters

- **pool** – [in] The thread pool to resume a processing unit on.
- **virt_core** – [in] The processing unit on the pool to be resumed. The processing units are indexed starting from 0.

Returns A `future<void>` which is ready when the given processing unit has been resumed.

`void resume_processing_unit_cb(thread_pool_base &pool, hpx::function<void()> callback, std::size_t virt_core, error_code &ec = throws)`

Resumes the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been resumed.

Note: Requires that the pool has `threads::policies::enable_elasticity` set.

Parameters

- **pool** – [in] The thread pool to resume a processing unit on.
- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt_core** – [in] The processing unit to resume.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`hpx::future<void> suspend_processing_unit(thread_pool_base &pool, std::size_t virt_core)`

Suspends the given processing unit. When the processing unit has been suspended the returned future will be ready.

Note: Can only be called from an HPX thread. Use `suspend_processing_unit_cb` or to suspend the processing unit from outside HPX. Requires that the pool has `threads::policies::enable_elasticity` set.

Parameters

- **pool** – [in] The thread pool to suspend a processing unit from.
- **virt_core** – [in] The processing unit on the pool to be suspended. The processing units are indexed starting from 0.

Throws `hpx::exception` – if called from outside the HPX runtime.

Returns A future<void> which is ready when the given processing unit has been suspended.

```
void suspend_processing_unit_cb(hpx::function<void()> callback, thread_pool_base &pool,  
                                std::size_t virt_core, error_code &ec = throws)
```

Suspends the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been suspended.

Note: Requires that the pool has threads::policies::enable_elasticity set.

Parameters

- **pool** – [in] The thread pool to suspend a processing unit from.
- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt_core** – [in] The processing unit to suspend.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
hpx::future<void> resume_pool(thread_pool_base &pool)
```

Resumes the thread pool. When the all OS threads on the thread pool have been resumed the returned future will be ready.

Note: Can only be called from an HPX thread. Use resume_cb or resume_direct to suspend the pool from outside HPX.

Parameters **pool** – [in] The thread pool to resume.

Throws `hpx::exception` – if called from outside the HPX runtime.

Returns A future<void> which is ready when the thread pool has been resumed.

```
void resume_pool_cb(thread_pool_base &pool, hpx::function<void()> callback, error_code &ec =  
                        throws)
```

Resumes the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been resumed.

Parameters

- **pool** – [in] The thread pool to resume.
- **callback** – [in] called when the thread pool has been resumed.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
hpx::future<void> suspend_pool(thread_pool_base &pool)
```

Suspends the thread pool. When the all OS threads on the thread pool have been suspended the returned future will be ready.

Note: Can only be called from an HPX thread. Use suspend_cb or suspend_direct to suspend the pool from outside HPX. A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters **pool** – [in] The thread pool to suspend.

Throws `hpx::exception` – if called from outside the HPX runtime.

Returns A future<void> which is ready when the thread pool has been suspended.

```
void suspend_pool_cb(thread_pool_base &pool, hpx::function<void()> callback, error_code &ec = throws)
```

Suspends the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been suspended.

Note: A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters

- **pool** – [in] The thread pool to suspend.
- **callback** – [in] called when the thread pool has been suspended.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Throws `hpx::exception` – if called from an HPX thread which is running on the pool itself.

thread_support

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::unlock_guard

Defined in header `hpx/mutex.hpp`⁷⁸¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

```
template<typename Mutex>
```

```
class unlock_guard
```

#include <`unlock_guard.hpp`> The class `unlock_guard` is a mutex wrapper that provides a convenient mechanism for releasing a mutex for the duration of a scoped block.

`unlock_guard` performs the opposite functionality of `lock_guard`. When a `lock_guard` object is created, it attempts to take ownership of the mutex it is given. When control leaves the scope in which the `lock_guard` object was created, the `lock_guard` is destructed and the mutex is released. Accordingly, when an `unlock_guard` object is created, it attempts to release the ownership of the mutex it is given. So, when control leaves the scope in which the `unlock_guard` object was created, the `unlock_guard` is destructed and the mutex is owned again. In this way, the mutex is unlocked in the constructor and locked in the destructor, so that one can have an unlocked section within a locked one.

⁷⁸¹ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/mutex.hpp

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

inline void **swap**(*jthread* &lhs, *jthread* &rhs) noexcept

⁷⁸² http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/thread.hpp

class **jthread**

`#include <jthread.hpp>` The class *jthread* represents a single thread of execution. It has the same general behavior as `hpx::thread`, except that *jthread* automatically rejoins on destruction, and can be cancelled/stopped in certain situations. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, `hpx::terminate` is called. The top-level function may communicate its return value or an exception to the caller via `hpx::promise` or by modifying shared variables (which may require synchronization, see `hpx::mutex` and `hpx::atomic`) Unlike `hpx::thread`, the *jthread* logically holds an internal private member of type `hpx::stop_source`, which maintains a shared stop-state. The *jthread* constructor accepts a function that takes a `hpx::stop_token` as its first argument, which will be passed in by the *jthread* from its internal `stop_source`. This allows the function to check if stop has been requested during its execution, and return if it has. `hpx::jthread` objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may be not associated with any *jthread* objects (after detach). No two `hpx::jthread` objects may represent the same thread of execution; `hpx::jthread` is not *CopyConstructible* or *CopyAssignable*, although it is *MoveConstructible* and *MoveAssignable*.

                 thread::id const&)
```

namespace **this_thread**

Functions

thread::*id* **get_id()** noexcept

Returns the id of the current thread.

void **yield()** noexcept

Provides a hint to the implementation to reschedule the execution of threads, allowing other threads to run.

Note: The exact behavior of this function depends on the implementation, in particular on the mechanics of the OS scheduler in use and the state of the system. For example, a first-in-first-out realtime scheduler (SCHED_FIFO in Linux) would suspend the current thread and put it on the back of the queue of the same-priority threads that are ready to run (and if there are no other threads at the same priority, yield has no effect).

void **yield_to**(*thread*::*id*) noexcept

threads::*thread_priority* **get_priority()** noexcept

std::ptrdiff_t **get_stack_size()** noexcept

void **interruption_point()**

bool **interruption_enabled()**

bool **interruption_requested()**

```
void interrupt()
```

```
void sleep_until(hpx::chrono::steady_time_point const &abs_time)
```

Blocks the execution of the current thread until specified *abs_time* has been reached.

It is recommended to use the clock tied to *abs_time*, in which case adjustments of the clock may be taken into account. Thus, the duration of the block might be more or less than *abs_time*-*Clock::now()* at the time of the call, depending on the direction of the adjustment and whether it is honored by the implementation. The function also may block until after *abs_time* has been reached due to process scheduling or resource contention delays.

Parameters **abs_time** – absolute time to block until

```
inline void sleep_for(hpx::chrono::steady_duration const &rel_time)
```

Blocks the execution of the current thread for at least the specified *rel_time*. This function may block for longer than *rel_time* due to scheduling or resource contention delays.

It is recommended to use a steady clock to measure the duration. If an implementation uses a system clock instead, the wait time may also be sensitive to clock adjustments.

Parameters **rel_time** – time duration to sleep

```
std::size_t get_thread_data()
```

```
std::size_t set_thread_data(std::size_t)
```

```
class disable_interruption

hpx::annotated_function

Defined in header `hpx/functional.hpp`⁷⁸⁴.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

⁷⁸⁴ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/functional.hpp

Functions

```
template<typename F>
constexpr F &&annotated_function(F &&f, char const* = nullptr) noexcept
```

Returns a function annotated with the given annotation.

Annotating includes setting the thread description per thread id.

Parameters **function** –

```
template<typename F>
constexpr F &&annotated_function(F &&f, std::string const&) noexcept
```

namespace **util**

Functions

```
template<typename F>
constexpr decltype(auto) annotated_function(F &&f, char const *name = nullptr) noexcept
```

```
template<typename F>
constexpr decltype(auto) annotated_function(F &&f, std::string const &name) noexcept
```

hpx/threading_base/print.hpp

Defined in header hpx/threading_base/print.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/threading_base/register_thread.hpp

Defined in header hpx/threading_base/register_thread.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **threads**

Functions

```
template<typename F>
thread_function_type make_thread_function(F &&f)
```

```
template<typename F>
thread_function_type make_thread_function_nullary(F &&f)
```

```
void register_thread(threads::thread_init_data &data, threads::thread_pool_base *pool,  
                    threads::thread_id_ref_type &id, error_code &ec = hpx::throws)
```

Create a new *thread* using the given data.

Note: As long as *ec* is not pre-initialized to *hpx*::*throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx*::*exception*.

Parameters

- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx*::*throws* the function will throw on error instead.

Throws *invalid_status* – if the runtime system has not been started yet.

Returns This function will return the internal id of the newly created HPX-thread.

```
threads::thread_id_ref_type register_thread(threads::thread_init_data &data,  
                                              threads::thread_pool_base *pool, error_code &ec =  
                                              hpx::throws)
```

```
void register_thread(threads::thread_init_data &data, threads::thread_id_ref_type &id, error_code  
&ec = throws)
```

Create a new *thread* using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

Note: As long as *ec* is not pre-initialized to *hpx*::*throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx*::*exception*.

Parameters

- **data** – [in] The data to use for creating the thread.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx*::*throws* the function will throw on error instead.

Throws *invalid_status* – if the runtime system has not been started yet.

Returns This function will return the internal id of the newly created HPX-thread.

```
threads::thread_id_ref_type register_thread(threads::thread_init_data &data, error_code &ec =  
                                              throws)
```

```
thread_id_ref_type register_work(threads::thread_init_data &data, threads::thread_pool_base *pool,  
                                    error_code &ec = hpx::throws)
```

Create a new work item using the given data.

Note: As long as *ec* is not pre-initialized to *hpx*::*throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx*::*exception*.

Parameters

- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx*::*throws* the function will throw on error instead.

Throws `invalid_status` – if the runtime system has not been started yet.

`thread_id_ref_type register_work(threads::thread_init_data &data, error_code &ec = throws)`

Create a new work item using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Parameters

- `data` – [in] The data to use for creating the thread.
- `ec` – [in,out] This represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Throws `invalid_status` – if the runtime system has not been started yet.

hpx::scoped_annotation

Defined in header `hpx/functional.hpp`⁷⁸⁵.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

struct `scoped_annotation`

`#include <scoped_annotation.hpp>` `scoped_annotation` associates a name with a section of code (scope). It can be used to visualize code execution in profiling tools like *Intel VTune*, *Apex Profiler*, etc. That allows analyzing performance to figure out which part(s) of code is (are) responsible for performance degradation, etc.

Public Functions

`HPX_NON_COPYABLE(scoped_annotation)`

inline explicit constexpr `scoped_annotation`(char const*) noexcept

template<typename F>

inline explicit constexpr `scoped_annotation`(F&&) noexcept

inline ~`scoped_annotation`()

namespace **util**

⁷⁸⁵ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/functional.hpp

Typedefs

typedef `hpx::scoped_annotation` instead

`hpx/threading_base/thread_data.hpp`

Defined in header `hpx/threading_base/thread_data.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **threads**

Functions

```
constexpr thread_data *get_thread_id_data(thread_id_ref_type const &tid) noexcept
```

```
constexpr thread_data *get_thread_id_data(thread_id_type const &tid) noexcept
```

```
class thread_data : public thread_data_reference_counting
```

`#include <thread_data.hpp>` A *thread* is the representation of a HPX thread. It's a first class object in HPX. In our implementation this is a user level thread running on top of one of the OS threads spawned by the *thread-manager*.

A *thread* encapsulates:

- A thread status word (see the functions `thread::get_state` and `thread::set_state`)
- A function to execute (the `thread` function)
- A frame (in this implementation this is a block of memory used as the threads stack)
- A block of registers (not implemented yet)

Generally, *threads* are not created or executed directly. All functionality related to the management of *threads* is implemented by the *thread-manager*.

Public Types

```
using spinlock_pool = util::spinlock_pool<thread_data>
```

Public Functions

```
thread_data(thread_data const&) = delete
```

```
thread_data(thread_data&&) = delete
```

```
thread_data &operator=(thread_data const&) = delete
```

```
thread_data &operator=(thread_data&&) = delete
```

```
inline thread_state get_state(std::memory_order const order = std::memory_order_acquire) const
    noexcept
```

The `get_state` function queries the state of this thread instance.

Note: This function will be seldom used directly. Most of the time the state of a thread will be retrieved by using the function `threadmanager::get_state`.

Returns This function returns the current state of this thread. It will return one of the values as defined by the `thread_state` enumeration.

```
inline thread_state set_state(thread_schedule_state const state, thread_restart_state state_ex =
    thread_restart_state::unknown, std::memory_order const load_order
    = std::memory_order_acquire, std::memory_order const
    exchange_order = std::memory_order_acq_rel) const noexcept
```

The `set_state` function changes the state of this thread instance.

Note: This function will be seldom used directly. Most of the time the state of a thread will have to be changed using the thread-manager. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status `threadmanager::set_state` should be used.

Parameters

- **state** – [in] The new state to be set for the thread.
- **state_ex** – [in]
- **load_order** – [in]
- **exchange_order** – [in]

```
inline bool set_state_tagged(thread_schedule_state const newstate, thread_state const
    &prev_state, thread_state &new_tagged_state, std::memory_order
    exchange_order = std::memory_order_acq_rel) const noexcept
```

```
inline bool restore_state(thread_state const new_state, thread_state const old_state,
    std::memory_order const load_order = std::memory_order_relaxed,
    std::memory_order const load_exchange =
    std::memory_order_acq_rel) const noexcept
```

The `restore_state` function changes the state of this thread instance depending on its current state. It will change the state atomically only if the current state is still the same as passed as the second parameter. Otherwise it won't touch the thread state of this instance.

Note: This function will be seldom used directly. Most of the time the state of a thread will have to be changed using the threadmanager. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status `threadmanager::set_state` should be used.

Parameters

- **new_state** – [in] The new state to be set for the thread.
- **old_state** – [in] The old state of the thread which still has to be the current state.
- **load_order** – [in]
- **load_exchange** – [in]

Returns This function returns *true* if the state has been changed successfully

```
inline bool restore_state(thread_schedule_state new_state, thread_restart_state const state_ex,
                        thread_state old_state, std::memory_order const load_exchange =
                        std::memory_order_acq_rel) const noexcept

inline constexpr thread_priority get_priority() const noexcept

inline void set_priority(thread_priority priority) noexcept

inline bool interruption_requested() const noexcept

inline bool interruption_enabled() const noexcept

inline bool set_interruption_enabled(bool enable) noexcept

inline void interrupt(bool flag = true)

bool interruption_point(bool throw_on_interrupt = true)

bool add_thread_exit_callback(function<void()> const &f)

void run_thread_exit_callbacks()

inline constexpr bool is_stackless() const noexcept

void destroy_thread() override

inline constexpr policies::scheduler_base *get_scheduler_base() const noexcept

inline constexpr std::size_t get_last_worker_thread_num() const noexcept

inline void set_last_worker_thread_num(std::size_t last_worker_thread_num) noexcept

inline constexpr std::ptrdiff_t get_stack_size() const noexcept

inline thread_stacksize get_stack_size_enum() const noexcept

template<typename ThreadQueue>
inline constexpr ThreadQueue &get_queue() noexcept

inline coroutine_type::result_type operator() (hpx::execution_base::this_thread::detail::agent_storage
                                            *agent_storage)
```

Execute the thread function.

Returns This function returns the thread state the thread should be scheduled from this point on. The thread manager will use the returned value to set the thread's scheduling status.

```
inline coroutine_type::result_type invoke_directly()
```

Directly execute the thread function (inline)

Returns This function returns the thread state the thread should be scheduled from this point on. The thread manager will use the returned value to set the thread's scheduling status.

```
inline virtual thread_id_type get_thread_id() const
```

```
inline virtual std::size_t get_thread_phase() const noexcept
```

```
virtual std::size_t get_thread_data() const = 0
```

```

virtual std::size_t set_thread_data(std::size_t data) = 0
virtual void init() = 0
virtual void rebind(thread_init_data &init_data) = 0
thread_data(thread_init_data &init_data, void *queue, std::ptrdiff_t stacksize, bool is_stackless =
    false, thread_id_addr addref = thread_id_addr::yes)
virtual ~thread_data() override
virtual void destroy() noexcept = 0

```

Public Static Functions

```

static inline constexpr std::uint64_t get_component_id() noexcept
    Return the id of the component this thread is running in.
static inline constexpr threads::thread_description get_description() noexcept
static inline constexpr threads::thread_description set_description(threads::thread_description)
    noexcept
static inline constexpr threads::thread_description get_lco_description() noexcept
static inline constexpr threads::thread_description set_lco_description(threads::thread_description)
    noexcept
static inline constexpr std::uint32_t get_parent_locality_id() noexcept
    Return the locality of the parent thread.
static inline constexpr thread_id_type get_parent_thread_id() noexcept
    Return the thread id of the parent thread.
static inline constexpr std::size_t get_parent_thread_phase() noexcept
    Return the phase of the parent thread.
static inline constexpr util::backtrace const *get_backtrace() noexcept
static inline constexpr util::backtrace const *set_backtrace(util::backtrace const*) noexcept

```

Protected Functions

```

inline thread_restart_state set_state_ex(thread_restart_state const new_state,
    std::memory_order const load_order =
        std::memory_order_acquire, std::memory_order const
    load_exchange = std::memory_order_acq_rel) const
    noexcept

```

The set_state function changes the extended state of this thread instance.

Note: This function will be seldom used directly. Most of the time the state of a thread will have to be changed using the threadmanager.

Parameters

- **new_state** – [in] The new extended state to be set for the thread.
- **load_order** – [in]
- **load_exchange** – [in]

```
void rebinding_base(thread_init_data &init_data)

hpx/threading_base/thread_description.hpp

Defined in header hpx/threading_base/thread_description.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **threads**

Functions

```
std::ostream &operator<<(std::ostream&, thread_description const&)

std::string as_string(thread_description const &desc)

threads::thread_description get_thread_description(thread_id_type const &id, error_code &ec =
throws)
```

The function `get_thread_description` is part of the thread related API allows to query the description of one of the threads known to the thread-manager.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Parameters

- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns This function returns the description of the thread referenced by the `id` parameter.
If the thread is not known to the thread-manager the return value will be the string “<unknown>”.

```
threads::thread_description set_thread_description(thread_id_type const &id,
threads::thread_description const &desc =
threads::thread_description(), error_code &ec =
throws)
```

```
threads::thread_description get_thread_lco_description(thread_id_type const &id, error_code
&ec = throws)
```

```
threads::thread_description set_thread_lco_description(thread_id_type const &id,
threads::thread_description const &desc =
threads::thread_description(), error_code &ec = throws)
```

hpx/threading_base/thread_helpers.hpp

Defined in header hpx/threading_base/thread_helpers.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
namespace this_thread
```

Functions

```
threads::thread_restart_state suspend(threads::thread_schedule_state state, threads::thread_id_type
                                     nextid, threads::thread_description const &description =
                                     threads::thread_description("this_thread::suspend"), error_code
                                     &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

Note: Must be called from within a HPX-thread.

Throws If – &ec != &throws, never throws, but will set ec to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(threads::thread_schedule_state state =
                                             threads::thread_schedule_state::pending,
                                             threads::thread_description const &description =
                                             threads::thread_description("this_thread::suspend"),
                                             error_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

Note: Must be called from within a HPX-thread.

Throws If – &ec != &throws, never throws, but will set ec to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
threads::thread_restart_state suspend(hpx::chrono::steady_time_point const &abs_time,
                                      threads::thread_id_type id, threads::thread_description const
                                      &description =
                                      threads::thread_description("this_thread::suspend"), error_code
                                      &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads at the given time.

Note: Must be called from within a HPX-thread.

Throws If – &ec != &throws, never throws, but will set ec to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_time_point const &abs_time,  
    threads::thread_description const &description =  
    threads::thread_description("this_thread::suspend"),  
    error_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads at the given time.

Note: Must be called from within a HPX-thread.

Throws If *- &ec != &throws*, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,  
    threads::thread_description const &description =  
    threads::thread_description("this_thread::suspend"),  
    error_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

Note: Must be called from within a HPX-thread.

Throws If *- &ec != &throws*, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,  
    threads::thread_id_type const &id,  
    threads::thread_description const &description =  
    threads::thread_description("this_thread::suspend"),  
    error_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

Note: Must be called from within a HPX-thread.

Throws If *- &ec != &throws*, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(std::uint64_t ms, threads::thread_description const
&description =
threads::thread_description("this_thread::suspend"),
error_code &ec = throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given time (specified in milliseconds).

Note: Must be called from within a HPX-thread.

Throws If – &ec != &throws, never throws, but will set ec to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
threads::thread_pool_base *get_pool(error_code &ec = throws)
```

Returns a pointer to the pool that was used to run the current thread

Throws If – &ec != &throws, never throws, but will set ec to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

namespace **threads**

Functions

```
thread_state set_thread_state(thread_id_type const &id, thread_schedule_state state =
thread_schedule_state::pending, thread_restart_state stateex =
thread_restart_state::signaled, thread_priority priority =
thread_priority::normal, bool retry_on_active = true, hpx::error_code
&ec = throws)
```

Set the thread state of the *thread* referenced by the *thread_id id*.

Note: If the thread referenced by the parameter *id* is in *thread_state::active* state this function schedules a new thread which will set the state of the thread as soon as its not active anymore. The function returns *thread_state::active* in this case.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.

- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns This function returns the previous state of the thread referenced by the `id` parameter.

It will return one of the values as defined by the `thread_state` enumeration. If the thread is not known to the thread-manager the return value will be `thread_state::unknown`.

```
thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_time_point  
const &abs_time, std::atomic<bool> *started,  
thread_schedule_state state = thread_schedule_state::pending,  
thread_restart_state stateex = thread_restart_state::timeout,  
thread_priority priority = thread_priority::normal, bool  
retry_on_active = true, error_code &ec = throws)
```

Set the thread state of the `thread` referenced by the `thread_id id`.

Set a timer to set the state of the given `thread` to the given new value after it expired (at the given time)

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **abs_time** – [in] Absolute point in time for the new thread to be run
- **started** – [in,out] A helper variable allowing to track the state of the timer helper thread
- **state** – [in] The new state to be set for the thread referenced by the `id` parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the `id` parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns

```
inline thread_id_ref_type set_thread_state(thread_id_type const &id,  
                                         hpx::chrono::steady_time_point const &abs_time,  
                                         thread_schedule_state state =  
                                         thread_schedule_state::pending, thread_restart_state  
                                         stateex = thread_restart_state::timeout, thread_priority  
                                         priority = thread_priority::normal, bool retry_on_active  
                                         = true, error_code &ec = throws)
```

```
inline thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_duration  
const &rel_time, thread_schedule_state state =  
thread_schedule_state::pending, thread_restart_state  
stateex = thread_restart_state::timeout, thread_priority  
priority = thread_priority::normal, bool retry_on_active  
= true, error_code &ec = throws)
```

Set the thread state of the `thread` referenced by the `thread_id id`.

Set a timer to set the state of the given `thread` to the given new value after it expired (after the given duration)

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the

result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **rel_time** – [in] Time duration after which the new thread should be run
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

`thread_state get_thread_state(thread_id_type const &id, error_code &ec = throws) noexcept`

The function `get_thread_backtrace` is part of the thread related API allows to query the currently stored thread back trace (which is captured during thread suspension).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception. The function `get_thread_state` is part of the thread related API. It queries the state of one of the threads known to the thread-manager.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.
- **id** – [in] The thread id of the thread the state should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns the currently captured stack back trace of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the zero.

Returns This function returns the thread state of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be *terminated*.

`std::size_t get_thread_phase(thread_id_type const &id, error_code &ec = throws) noexcept`

The function `get_thread_phase` is part of the thread related API. It queries the phase of one of the threads known to the thread-manager.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread the phase should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns the thread phase of the thread referenced by the *id* parameter.

If the thread is not known to the thread-manager the return value will be ~0.

bool **get_thread_interruption_enabled**(thread_id_type const &*id*, *error_code* &*ec* = *throws*)

Returns whether the given thread can be interrupted at this point.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if the given thread can be interrupted at this point in time.

It will return *false* otherwise.

bool **set_thread_interruption_enabled**(thread_id_type const &*id*, bool *enable*, *error_code* &*ec* = *throws*)

Set whether the given thread can be interrupted at this point.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should receive the new value.
- **enable** – [in] This value will determine the new interruption enabled status for the given thread.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns the previous value of whether the given thread could have been interrupted.

bool **get_thread_interruption_requested**(thread_id_type const &*id*, *error_code* &*ec* = *throws*)

Returns whether the given thread has been flagged for interruption.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if the given thread was flagged for interruption. It will return *false* otherwise.

void **interrupt_thread**(thread_id_type const &*id*, bool *flag*, *error_code* &*ec* = *throws*)

Flag the given thread for interruption.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be interrupted.
- **flag** – [in] The flag encodes whether the thread should be interrupted (if it is *true*), or ‘uninterrupted’ (if it is *false*).
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline void **interrupt_thread**(thread_id_type const &id, *error_code* &ec = *throws*)

void **interruption_point**(thread_id_type const &id, *error_code* &ec = *throws*)

Interrupt the current thread at this point if it was canceled. This will throw a *thread_interrupted* exception, which will cancel the thread.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn’t throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be interrupted.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

threads::thread_priority **get_thread_priority**(thread_id_type const &id, *error_code* &ec = *throws*)
noexcept

Return priority of the given thread

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn’t throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::ptrdiff_t **get_stack_size**(thread_id_type const &id, *error_code* &ec = *throws*) noexcept

Return stack size of the given thread

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn’t throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

threads::thread_pool_base ***get_pool**(thread_id_type const &id, *error_code* &ec = *throws*)

Returns a pointer to the pool that was used to run the current thread

Throws If – &ec != &throws, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside of a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

hpx::get_worker_thread_num, hpx::get_local_worker_thread_num, hpx::get_local_worker_thread_num, hpx::get_thread_pool_num, hpx::get_thread_pool_num

Defined in header `hpx/runtime.hpp`⁷⁸⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

`std::size_t get_worker_thread_num()` noexcept

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by `get_os_thread_count()`).

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t get_worker_thread_num(error_code&)` noexcept

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by `get_os_thread_count()`). It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters `ec` – [in,out] this represents the error status on exit (obsolete, ignored).

`std::size_t get_local_worker_thread_num()` noexcept

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

⁷⁸⁶ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/runtime.hpp>

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t get_local_worker_thread_num(error_code&)` noexcept

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters `ec` – [in,out] this represents the error status on exit (obsolete, ignored).

`std::size_t get_thread_pool_num()` noexcept

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t get_thread_pool_num(error_code&)` noexcept

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters `ec` – [in,out] this represents the error status on exit (obsolete, ignored).

namespace `threads`

hpx/threading_base/thread_pool_base.hpp

Defined in header hpx/threading_base/thread_pool_base.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **threads**

Functions

`std::ostream &operator<<(std::ostream &os, thread_pool_base const &thread_pool)`

class **thread_pool_base**

`#include <thread_pool_base.hpp>` The base class used to manage a pool of OS threads.

Public Functions

`virtual void suspend_processing_unit_direct(std::size_t virt_core, error_code &ec = throws) = 0`

Suspends the given processing unit. Blocks until the processing unit has been suspended.

Parameters

- **virt_core** – [in] The processing unit on the the pool to be suspended. The processing units are indexed starting from 0.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`virtual void resume_processing_unit_direct(std::size_t virt_core, error_code &ec = throws) = 0`

Resumes the given processing unit. Blocks until the processing unit has been resumed.

Parameters

- **virt_core** – [in] The processing unit on the the pool to be resumed. The processing units are indexed starting from 0.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`virtual void resume_direct(error_code &ec = throws) = 0`

Resumes the thread pool. Blocks until all OS threads on the thread pool have been resumed.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`virtual void suspend_direct(error_code &ec = throws) = 0`

Suspends the thread pool. Blocks until all OS threads on the thread pool have been suspended.

Note: A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Throws `hpx::exception` – if called from an HPX thread which is running on the pool itself.

namespace **hpx**

 namespace **threads**

Functions

`thread_data *get_self_id_data() noexcept`

The function `get_self_id_data` returns the data of the HPX thread id associated with the current thread (or nullptr if the current thread is not a HPX thread).

`thread_self &get_self()`

The function `get_self` returns a reference to the (OS thread specific) self reference to the current HPX thread.

`thread_self *get_self_ptr() noexcept`

The function `get_self_ptr` returns a pointer to the (OS thread specific) self reference to the current HPX thread.

`thread_self_impl_type *get_ctx_ptr()`

The function `get_ctx_ptr` returns a pointer to the internal data associated with each coroutine.

`thread_self *get_self_ptr_checked(error_code &ec = throws)`

The function `get_self_ptr_checked` returns a pointer to the (OS thread specific) self reference to the current HPX thread.

`thread_id_type get_self_id() noexcept`

The function `get_self_id` returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

`thread_id_type get_outer_self_id() noexcept`

The function `get_outer_self_id` returns the HPX thread id of the current outer thread (or zero if the current thread is not a HPX thread). This usually returns the same as `get_self_id`, except for directly executed threads, in which case this returns the thread id of the outermost HPX thread.

`thread_id_type get_parent_id() noexcept`

The function `get_parent_id` returns the HPX thread id of the current thread's parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

`std::size_t get_parent_phase()` noexcept

The function `get_parent_phase` returns the HPX phase of the current thread's parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

`std::ptrdiff_t get_self_stacksize()` noexcept

The function `get_self_stacksize` returns the stack size of the current thread (or zero if the current thread is not a HPX thread).

`thread_stacksize get_self_stacksize_enum()` noexcept

The function `get_self_stacksize_enum` returns the stack size of the /.

`std::uint32_t get_parent_locality_id()` noexcept

The function `get_parent_locality_id` returns the id of the locality of the current thread's parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

`std::uint64_t get_self_component_id()` noexcept

The function `get_self_component_id` returns the lva of the component the current thread is acting on

Note: This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_TARGET_ADDRESS` being defined.

namespace **policies**

threadmanager

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/modules/threadmanager.hpp

Defined in header `hpx/modules/threadmanager.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **threads**

class **threadmanager**

`#include <threadmanager.hpp>` The `thread-manager` class is the central instance of management for all (non-depleted) threads

Public Types

```
using notification_policy_type = threads::policies::callback_notifier
```

```
using pool_type = std::unique_ptr<thread_pool_base>
```

```
using pool_vector = std::vector<pool_type>
```

Public Functions

```
threadmanager(hpx::util::runtime_configuration &rtcfg_, notification_policy_type &notifier,  
             detail::network_background_callback_type const &network_background_callback  
             = detail::network_background_callback_type())
```

```
threadmanager(threadmanager const&) = delete
```

```
threadmanager(threadmanager&&) = delete
```

```
threadmanager &operator=(threadmanager const&) = delete
```

```
threadmanager &operator=(threadmanager&&) = delete
```

```
~threadmanager()
```

```
void init() const
```

```
void create_pools()
```

```
void print_pools(std::ostream&) const
```

FIXME move to private and add `-hpx:printpools` cmd line option.

```
thread_pool_base &default_pool() const
```

```
thread_pool_base &get_pool(std::string const &pool_name) const
```

```
thread_pool_base &get_pool(pool_id_type const &pool_id) const
```

```
thread_pool_base &get_pool(std::size_t thread_index) const
```

```
bool pool_exists(std::string const &pool_name) const
```

```
bool pool_exists(std::size_t pool_index) const
```

```
thread_id_ref_type register_work(thread_init_data &data, error_code &ec = throws) const
```

The function `register_work` adds a new work item to the thread manager. It doesn't immediately create a new `thread`, it just adds the task parameters (function, initial state and description) to the internal management data structures. The thread itself will be created when the number of existing threads drops below the number of threads specified by the constructors `max_count` parameter.

Parameters

- **data** – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- **ec** –

```
void register_thread(thread_init_data &data, thread_id_ref_type &id, error_code &ec =  
throws) const
```

The function *register_thread* adds a new work item to the thread manager. It creates a new *thread*, adds it to the internal management data structures, and schedules the new thread, if appropriate.

Parameters

- **data** – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- **id** – [out] This parameter will hold the id of the created thread. This id is guaranteed to be validly initialized before the thread function is executed.
- **ec** –

```
bool run() const
```

Run the thread manager’s work queue. This function instantiates the specified number of OS threads in each pool. All OS threads are started to execute the function *tfunc*.

Returns The function returns *true* if the thread manager has been started successfully, otherwise it returns *false*.

```
void stop(bool blocking = true) const
```

Forcefully stop the thread-manager.

Parameters **blocking** –

```
bool is_busy() const
```

```
bool is_idle() const
```

```
void wait() const
```

```
bool wait_for(hpx::chrono::steady_duration const &rel_time) const
```

```
void suspend() const
```

```
void resume() const
```

```
hpx::state status() const
```

Return whether the thread manager is still running. This returns the “minimal state”, i.e. the state of the least advanced thread pool

```
std::int64_t get_thread_count(thread_schedule_state state = thread_schedule_state::unknown,  
thread_priority priority = thread_priority::default_, std::size_t  
num_thread = static_cast<std::size_t>(-1), bool reset = false)  
const
```

return the number of HPX-threads with the given state

Note: This function locks the internal OS lock in the thread manager

```
std::int64_t get_idle_core_count() const
```

```
mask_type get_idle_core_mask() const
```

```
std::int64_t get_background_thread_count() const
```

```
bool enumerate_threads(hpx::function<bool(thread_id_type)> const &f, thread_schedule_state  
state = thread_schedule_state::unknown) const
```

```
void abort_all_suspended_threads() const
bool cleanup_terminated(bool delete_all) const
std::size_t get_os_thread_count() const
    Return the number of OS threads running in this thread-manager.
    This function will return correct results only if the thread-manager is running.
std::thread &get_os_thread_handle(std::size_t num_thread) const
void report_error(std::size_t num_thread, std::exception_ptr const &e) const
    API functions forwarding to notification policy.
    This notifies the thread manager that the passed exception has been raised. The exception will be
    routed through the notifier and the scheduler (which will result in it being passed to the runtime
    object, which in turn will report it to the console, etc.).
mask_type get_used_processing_units() const
    Returns the mask identifying all processing units used by this thread manager.
hwloc_bitmap_ptr get_pool numa_bitmap(std::string const &pool_name) const
void set_scheduler_mode(threads::policies::scheduler_mode mode) const noexcept
void add_scheduler_mode(threads::policies::scheduler_mode mode) const noexcept
void add_remove_scheduler_mode(threads::policies::scheduler_mode to_add_mode,

timed_execution

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/timed_execution/timed_execution.hpp

Defined in header `hpx/timed_execution/timed_execution.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

```
namespace parallel
```

```
    namespace execution
```

hpx/timed_execution/timed_execution_fwd.hpp

Defined in header `hpx/timed_execution/timed_execution_fwd.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

 namespace **parallel**

 namespace **execution**

Variables

`hpx::parallel::execution::post_at_t post_at`

`hpx::parallel::execution::post_after_t post_after`

`hpx::parallel::execution::async_execute_at_t async_execute_at`

`hpx::parallel::execution::async_execute_after_t async_execute_after`

`hpx::parallel::execution::sync_execute_at_t sync_execute_at`

`hpx::parallel::execution::sync_execute_after_t sync_execute_after`

```
struct async_execute_after_t : public
hpx::functional::detail::tag_fallback<async_execute_after_t>
```

`#include <timed_execution_fwd.hpp>` Customization point of asynchronous execution agent creation supporting timed execution.

This asynchronously creates a single function invocation `f()` using the associated executor at the given point in time.

Note: This calls `exec.async_execute_after(rel_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::async_execute()` on the underlying non-time-scheduled execution agent.

Param exec [in] The executor object to use for scheduling of the function *f*.

Param rel_time [in] The duration of time after which the given function should be scheduled to run.

Param f [in] The function which will be scheduled using the given executor.

Param ts... [in] Additional arguments to use to invoke *f*.

Return *f(ts...)*'s result through a future

Private Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(async_execute_after_t, Executor &&exec,
                                               hpx::chrono::steady_duration const
                                               &rel_time, F &&f, Ts&&... ts)
```

```
struct async_execute_at_t : public hpx::functional::detail::tag_fallback<async_execute_at_t>
#include <timed_execution_fwd.hpp> Customization point of asynchronous execution agent creation supporting timed execution.
```

This asynchronously creates a single function invocation f() using the associated executor at the given point in time.

Note: This calls exec.async_execute_at(abs_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::async_execute() on the underlying non-time-scheduled execution agent.

Param exec [in] The executor object to use for scheduling of the function *f*.

Param abs_time [in] The point in time the given function should be scheduled at to run.

Param f [in] The function which will be scheduled using the given executor.

Param ts... [in] Additional arguments to use to invoke *f*.

Return *f(ts...)*'s result through a future

Private Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(async_execute_at_t, Executor &&exec,
                                               hpx::chrono::steady_time_point const
                                               &abs_time, F &&f, Ts&&... ts)
```

```
struct post_after_t : public hpx::functional::detail::tag_fallback<post_after_t>
#include <timed_execution_fwd.hpp> Customization point of asynchronous fire & forget execution agent creation supporting timed execution.
```

This asynchronously (fire & forget) creates a single function invocation f() using the associated executor at the given point in time.

Note: This calls exec.post_after(rel_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::post() on the underlying non-time-scheduled execution agent.

Param exec [in] The executor object to use for scheduling of the function *f*.

Param rel_time [in] The duration of time after which the given function should be scheduled to run.

Param f [in] The function which will be scheduled using the given executor.

Param ts... [in] Additional arguments to use to invoke *f*.

Private Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(post_after_t, Executor &&exec,
                                               hpx::chrono::steady_duration const
                                               &rel_time, F &&f, Ts&&... ts)
```

```
struct post_at_t : public hpx::functional::detail::tag_fallback<post_at_t>
#include <timed_execution_fwd.hpp> Customization point of asynchronous fire & forget execution agent creation supporting timed execution.
```

This asynchronously (fire & forget) creates a single function invocation f() using the associated executor at the given point in time.

Note: This calls exec.post_at(abs_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::post() on the underlying non-time-scheduled execution agent.

Param exec [in] The executor object to use for scheduling of the function *f*.

Param abs_time [in] The point in time the given function should be scheduled at to run.

Param f [in] The function which will be scheduled using the given executor.

Param ts... [in] Additional arguments to use to invoke *f*.

Private Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(post_at_t, Executor &&exec,
                                               hpx::chrono::steady_time_point const
                                               &abs_time, F &&f, Ts&&... ts)
```

```
struct sync_execute_after_t : public
hpx::functional::detail::tag_fallback<sync_execute_after_t>
```

```
#include <timed_execution_fwd.hpp> Customization point of synchronous execution agent creation supporting timed execution.
```

This synchronously creates a single function invocation f() using the associated executor at the given point in time.

Note: This calls exec.sync_execute_after(rel_time, f, ts...), if available, otherwise it emulates timed scheduling by delaying calling execution::sync_execute() on the underlying non-time-scheduled execution agent.

Param exec [in] The executor object to use for scheduling of the function *f*.

Param rel_time [in] The duration of time after which the given function should be scheduled to run.

Param f [in] The function which will be scheduled using the given executor.

Param ts... [in] Additional arguments to use to invoke *f*.

Return *f(ts...)*'s result

Private Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) friend tag_fallback_invoke(sync_execute_after_t, Executor &&exec,
                                               hpx::chrono::steady_duration const
                                               &rel_time, F &&f, Ts&&... ts)
```

```
struct sync_execute_at_t : public hpx::functional::detail::tag_fallback<sync_execute_at_t>

timing

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx::chrono::high_resolution_clock

Defined in header `hpx/chrono.hpp`⁷⁸⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **chrono**

struct **high_resolution_clock**

`#include <high_resolution_clock.hpp>` Class `hpx::chrono::high_resolution_clock` represents the clock with the smallest tick period provided by the implementation. It may be an alias of `std::chrono::system_clock` or `std::chrono::steady_clock`, or a third, independent clock. `hpx::chrono::high_resolution_clock` meets the requirements of *TrivialClock*.

Public Static Functions

`static inline std::uint64_t now() noexcept`

returns a `std::chrono::time_point` representing the current value of the clock

`static inline constexpr std::uint64_t min() noexcept`

`static inline constexpr std::uint64_t max() noexcept`

hpx::chrono::high_resolution_timer

Defined in header `hpx/chrono.hpp`⁷⁸⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **chrono**

class **high_resolution_timer**

`#include <high_resolution_timer.hpp>` `high_resolution_timer` is a timer object which measures the elapsed time

⁷⁸⁷ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/core/include_local/include/hpx/chrono.hpp

~topology()

inline *std*::size_t **get_socket_number**(*std*::size_t num_thread, [[maybe_unused]] *error_code* &ec
= *throws*) const noexcept

Return the Socket number of the processing unit the given thread is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline *std*::size_t **get numa_node_number**(*std*::size_t num_thread, [[maybe_unused]] *error_code*
&ec = *throws*) const noexcept

Return the NUMA node number of the processing unit the given thread is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_machine_affinity_mask**(*error_code* &ec = *throws*) const noexcept

Return a bit mask where each set bit corresponds to a processing unit available to the application.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_type **get_service_affinity_mask**(mask_cref_type used_processing_units, *error_code*
&ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the service threads in the application.

Parameters

- **used_processing_units** – [in] This is the mask of processing units which are not available for service threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_socket_affinity_mask**(*std*::size_t num_thread, *error_code* &ec = *throws*)
const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the socket it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get numa_node_affinity_mask**(*std*::size_t num_thread, *error_code* &ec =
throws) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the NUMA domain it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_cref_type get_core_affinity_mask(std::size_t num_thread, error_code &ec = throws)  
const
```

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the core it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_cref_type get_thread_affinity_mask(std::size_t num_thread, error_code &ec = throws)  
const
```

Return a bit mask where each set bit corresponds to a processing unit available to the given thread.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
void set_thread_affinity_mask(mask_cref_type mask, error_code &ec = throws) const
```

Use the given bit mask to set the affinity of the given thread. Each set bit corresponds to a processing unit the thread will be allowed to run on.

Note: Use this function on systems where the affinity must be set from inside the thread itself.

Parameters

- **mask** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_type get_thread_affinity_mask_from_lva(void const *lva, error_code &ec = throws)  
const
```

Return a bit mask where each set bit corresponds to a processing unit co-located with the memory the given address is currently allocated on.

Parameters

- **lva** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
void print_affinity_mask(std::ostream &os, std::size_t num_thread, mask_cref_type m,  
std::string const &pool_name) const
```

Prints the given mask *m* to *os* in a human readable form.

```
bool reduce_thread_priority(error_code &ec = throws) const
```

Reduce thread priority of the current thread.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
std::size_t get_number_of_sockets() const
    Return the number of available NUMA domains.

std::size_t get_number_of_numa_nodes() const
    Return the number of available NUMA domains.

std::size_t get_number_of_cores() const
    Return the number of available cores.

std::size_t get_number_of_pus() const noexcept
    Return the number of available hardware processing units.

std::size_t get_number_of_numa_node_cores(std::size_t numa) const
    Return number of cores in given numa domain.

std::size_t get_number_of_numa_node_pus(std::size_t numa) const
    Return number of processing units in a given numa domain.

std::size_t get_number_of_socket_pus(std::size_t socket) const
    Return number of processing units in a given socket.

std::size_t get_number_of_core_pus(std::size_t core) const
    Return number of processing units in given core.

std::size_t get_number_of_socket_cores(std::size_t socket) const
    Return number of cores units in given socket.

inline std::size_t get_core_number(std::size_t num_thread, error_code& = throws) const

util

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/util/insert_checked.hpp

Defined in header `hpx/util/insert_checked.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

Functions

```
template<typename Iterator>
constexpr bool insert_checked(std::pair<Iterator, bool> const &r) noexcept
```

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

Parameters `r` – [in] The return value of a std::map insert operation.

Returns This function returns `r.second`.

```
template<typename Iterator>
bool insert_checked(std::pair<Iterator, bool> const &r, Iterator &it)
```

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

Parameters

- `r` – [in] The return value of a std::map insert operation.
- `r` – [out] A reference to an Iterator, which is set to `r.first`.
- `it` – [out] on exit, will hold the iterator referring to the inserted element

Returns This function returns `r.second`.

hpx/util/sed_transform.hpp

Defined in header `hpx/util/sed_transform.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

Functions

```
bool parse_sed_expression(std::string const &input, std::string &search, std::string &replace)
```

Parse a sed command.

Note: Currently, only supports search and replace syntax (s/search/replace/)

Parameters

- **input** – [in] The content to parse.
- **search** – [out] If the parsing is successful, this string is set to the search expression.
- **replace** – [out] If the parsing is successful, this string is set to the replace expression.

Returns *true* if the parsing was successful, false otherwise.

```
struct sed_transform
```

```
#include <sed_transform.hpp> An unary function object which applies a sed command to its subject  
and returns the resulting string.
```

Note: Currently, only supports search and replace syntax (s/search/replace/)

Public Functions

```
sed_transform(std::string const &search, std::string replace)
```

```
explicit sed_transform(std::string const &expression)
```

```
std::string operator() (std::string const &input) const
```

```
inline explicit operator bool() const noexcept
```

```
inline bool operator!() const noexcept
```

Private Members

```
std::shared_ptr<command> command_
```

namespace **hpx**

 namespace **actions**

HPX_REGISTER_ACTION_DECLARATION, HPX_REGISTER_ACTION

Defined in header hpx/components.hpp.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_REGISTER_ACTION_DECLARATION(...)

Declare the necessary component action boilerplate code.

The macro *HPX_REGISTER_ACTION_DECLARATION* can be used to declare all the boilerplate code which is required for proper functioning of component actions in the context of *HPX*.

The parameter *action* is the type of the action to declare the boilerplate for.

This macro can be invoked with an optional second parameter. This parameter specifies a unique name of the action to be used for serialization purposes. The second parameter has to be specified if the first parameter is not usable as a plain (non-qualified) C++ identifier, i.e. the first parameter contains special characters which cannot be part of a C++ identifier, such as '<', '>', or ':'.

```
namespace app
{
    // Define a simple component exposing one action 'print_greeting'
    class HPX_COMPONENT_EXPORT server
        : public hpx::components::component_base<server>
    {
        void print_greeting ()
        {
            hpx::cout << "Hey, how are you?\n" << std::flush;
        }

        // Component actions need to be declared, this also defines the
        // type 'print_greeting_action' representing the action.
        HPX_DEFINE_COMPONENT_ACTION(server,
            print_greeting, print_greeting_action);
    };

    // Declare boilerplate code required for each of the component actions.
    HPX_REGISTER_ACTION_DECLARATION(app::server::print_greeting_action)
}
```

Example:

Note: This macro has to be used once for each of the component actions defined using one of the *HPX_DEFINE_COMPONENT_ACTION* macros. It has to be visible in all translation units using the action, thus it is recommended to place it into the header file defining the component.

HPX_REGISTER_ACTION_DECLARATION_(...)

HPX_REGISTER_ACTION_DECLARATION_1(action)

HPX_REGISTER_ACTION(...)

Define the necessary component action boilerplate code.

The macro *HPX_REGISTER_ACTION* can be used to define all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter *action* is the type of the action to define the boilerplate for.

This macro can be invoked with an optional second parameter. This parameter specifies a unique name of the action to be used for serialization purposes. The second parameter has to be specified if the first parameter is not usable as a plain (non-qualified) C++ identifier, i.e. the first parameter contains special characters which cannot be part of a C++ identifier, such as '<', '>', or ':'.

Note: This macro has to be used once for each of the component actions defined using one of the *HPX_DEFINE_COMPONENT_ACTION* or *HPX_DEFINE_PLAIN_ACTION* macros. It has to occur exactly once for each of the actions, thus it is recommended to place it into the source file defining the component.

Note: Only one of the forms of this macro *HPX_REGISTER_ACTION* or *HPX_REGISTER_ACTION_ID* should be used for a particular action, never both.

HPX_REGISTER_ACTION_ID(action, actionname, actionid)

Define the necessary component action boilerplate code and assign a predefined unique id to the action.

The macro *HPX_REGISTER_ACTION* can be used to define all the boilerplate code which is required for proper functioning of component actions in the context of HPX.

The parameter *action* is the type of the action to define the boilerplate for.

The parameter *actionname* specifies an unique name of the action to be used for serialization purposes. The second parameter has to be usable as a plain (non-qualified) C++ identifier, it should not contain special characters which cannot be part of a C++ identifier, such as '<', '>', or ':'.

The parameter *actionid* specifies an unique integer value which will be used to represent the action during serialization.

Note: This macro has to be used once for each of the component actions defined using one of the *HPX_DEFINE_COMPONENT_ACTION* or global actions *HPX_DEFINE_PLAIN_ACTION* macros. It has to occur exactly once for each of the actions, thus it is recommended to place it into the source file defining the component.

Note: Only one of the forms of this macro *HPX_REGISTER_ACTION* or *HPX_REGISTER_ACTION_ID* should be used for a particular action, never both.

namespace **hpx**

 namespace **actions**

hpx/actions_base/basic_action_fwd.hpp

Defined in header `hpx/actions_base/basic_action_fwd.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

 namespace **actions**

```
template<typename Component, typename Signature, typename Derived>
struct basic_action
{
    #include <basic_action_fwd.hpp>
    Template Parameters
    • Component – component type
    • Signature – return type and arguments
    • Derived – derived action class
```

HPX_DEFINE_COMPONENT_ACTION

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_DEFINE_COMPONENT_ACTION(...)

Registers a member function of a component as an action type with HPX.

The macro *HPX_DEFINE_COMPONENT_ACTION* can be used to register a member function of a component as an action type named *action_type*.

The parameter *component* is the type of the component exposing the member function *func* which should be associated with the newly defined action type. The parameter *action_type* is the name of the action type to register with HPX.

```
namespace app
{
    // Define a simple component exposing one action 'print_greeting'
```

(continues on next page)

(continued from previous page)

```

class HPX_COMPONENT_EXPORT server
    : public hpx::components::component_base<server>
{
    void print_greeting() const
    {
        hpx::cout << "Hey, how are you?\n" << std::flush;
    }

    // Component actions need to be declared, this also defines the
    // type 'print_greeting_action' representing the action.
    HPX_DEFINE_COMPONENT_ACTION(server, print_greeting,
        print_greeting_action);
};

}

```

Example:

The first argument must provide the type name of the component the action is defined for.

The second argument must provide the member function name the action should wrap.

The default value for the third argument (the typename of the defined action) is derived from the name of the function (as passed as the second argument) by appending ‘_action’. The third argument can be omitted only if the second argument with an appended suffix ‘_action’ resolves to a valid, unqualified C++ type name.

Note: The macro *HPX_DEFINE_COMPONENT_ACTION* can be used with 2 or 3 arguments. The third argument is optional.

namespace **hpx**

namespace **actions**

hpx/actions_base/lambda_to_action.hpp

Defined in header `hpx/actions_base/lambda_to_action.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

hpx/actions_base/plain_action.hpp

Defined in header `hpx/actions_base/plain_action.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

Defines

HPX_DEFINE_PLAIN_ACTION(...)

Defines a plain action type.

```
namespace app
{
    void some_global_function(double d)
    {
        cout << d;
    }

    // This will define the action type 'app::some_global_action' which
    // represents the function 'app::some_global_function'.
    HPX_DEFINE_PLAIN_ACTION(some_global_function, some_global_action);
}
```

Example:

Note: Usually this macro will not be used in user code unless the intent is to avoid defining the action_type in global namespace. Normally, the use of the macro *HPX_PLAIN_ACTION* is recommended.

Note: The macro *HPX_DEFINE_PLAIN_ACTION* can be used with 1 or 2 arguments. The second argument is optional. The default value for the second argument (the typename of the defined action) is derived from the name of the function (as passed as the first argument) by appending '_action'. The second argument can be omitted only if the first argument with an appended suffix '_action' resolves to a valid, unqualified C++ type name.

HPX_DECLARE_PLAIN_ACTION(...)

Declares a plain action type.

HPX_PLAIN_ACTION(...)

Defines a plain action type based on the given function *func* and registers it with HPX.

The macro *HPX_PLAIN_ACTION* can be used to define a plain action (e.g. an action encapsulating a global or free function) based on the given function *func*. It defines the action type *name* representing the given function. This macro additionally registers the newly define action type with HPX.

The parameter *func* is a global or free (non-member) function which should be encapsulated into a plain action. The parameter *name* is the name of the action type defined by this macro.

```
namespace app {
    void some_global_function(double d) {
        cout << d;
    }

    // This will define the action type 'some_global_action' which
```

(continues on next page)

(continued from previous page)

```
// represents the function 'app::some_global_function'.
HPX_PLAIN_ACTION(app::some_global_function, some_global_action)
```

Example:

Note: The macro *HPX_PLAIN_ACTION* has to be used at global namespace even if the wrapped function is located in some other namespace. The newly defined action type is placed into the global namespace as well.

Note: The macro *HPX_PLAIN_ACTION_ID* can be used with 1, 2, or 3 arguments. The second and third arguments are optional. The default value for the second argument (the typename of the defined action) is derived from the name of the function (as passed as the first argument) by appending ‘_action’. The second argument can be omitted only if the first argument with an appended suffix ‘_action’ resolves to a valid, unqualified C++ type name. The default value for the third argument is *hpx::components::factory_state::check*.

Note: Only one of the forms of this macro *HPX_PLAIN_ACTION* or *HPX_PLAIN_ACTION_ID* should be used for a particular action, never both.

HPX_PLAIN_ACTION_ID(func, name, id)

Defines a plain action type based on the given function *func* and registers it with HPX.

The macro *HPX_PLAIN_ACTION_ID* can be used to define a plain action (e.g. an action encapsulating a global or free function) based on the given function *func*. It defines the action type *actionname* representing the given function.

The parameter *actionid* specifies a unique integer value which will be used to represent the action during serialization.

The parameter *func* is a global or free (non-member) function which should be encapsulated into a plain action. The parameter *name* is the name of the action type defined by this macro.

The second parameter has to be usable as a plain (non-qualified) C++ identifier, it should not contain special characters which cannot be part of a C++ identifier, such as ‘<’, ‘>’, or ‘:’.

```
namespace app {
    void some_global_function(double d) {
        cout << d;
    }
}

// This will define the action type 'some_global_action' which
// represents the function 'app::some_global_function'.
HPX_PLAIN_ACTION_ID(app::some_global_function, some_global_action,
    some_unique_id);
```

Example:

Note: The macro `HPX_PLAIN_ACTION_ID` has to be used at global namespace even if the wrapped function is located in some other namespace. The newly defined action type is placed into the global namespace as well.

Note: Only one of the forms of this macro `HPX_PLAIN_ACTION` or `HPX_PLAIN_ACTION_ID` should be used for a particular action, never both.

                      std::uint32_t num_threads, error_code &ec = throws)
```

Add a locality to the runtime.

```
parcelset::endpoints_type const &resolve_locality(naming::gid_type const &gid, error_code
&ec = throws)
```

Resolve a locality to its prefix.

Returns Returns an empty vector if the locality is not registered.

```
bool has_resolved_locality(naming::gid_type const &gid)
```

```
bool unregister_locality(naming::gid_type const &gid, error_code &ec = throws)
```

Remove a locality from the runtime.

```
void remove_resolved_locality(naming::gid_type const &gid)
```

remove given locality from locality cache

```
bool get_console_locality(naming::gid_type &locality, error_code &ec = throws)
```

Get locality locality_id of the console locality.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **locality** – [out] The locality_id value uniquely identifying the console locality. This is valid only, if the return value of this function is true.
- **try_cache** – [in] If this is set to true the console is first tried to be found in the local cache. Otherwise this function will always query AGAS, even if the console locality_id is already known locally.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if a console locality_id exists and returns *false* otherwise.

```
bool get_localities(std::vector<naming::gid_type> &locality_ids,
                    components::component_type type, error_code &ec = throws) const
```

Query for the locality_ids of all known localities.

This function returns the locality_ids of all localities known to the AGAS server or all localities having a registered factory for a given component type.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **locality_ids** – [out] The vector will contain the prefixes of all localities registered with the AGAS server. The returned vector holds the prefixes representing the runtime_support components of these localities.
- **type** – [in] The component type will be used to determine the set of prefixes having a registered factory for this component. The default value for this parameter is *components::component_enum_type::invalid*, which will return prefixes of all localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
inline bool get_localities(std::vector<naming::gid_type> &locality_ids, error_code &ec = throws) const
```

```
hpx::future<std::uint32_t> get_num_localities_async(components::component_type type = to_int(hpx::components::component_enum_type::invalid)) const
```

Query for the number of all known localities.

This function returns the number of localities known to the AGAS server or the number of localities having a registered factory for a given component type.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **type** – [in] The component type will be used to determine the set of prefixes having a registered factory for this component. The default value for this parameter is *components::component_type::invalid*, which will return prefixes of all localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
std::uint32_t get_num_localities(components::component_type type, error_code &ec = throws) const
```

```
inline std::uint32_t get_num_localities(error_code &ec = throws) const
```

```
hpx::future<std::uint32_t> get_num_overall_threads_async() const
```

```
std::uint32_t get_num_overall_threads(error_code &ec = throws) const
```

```
hpx::future<std::vector<std::uint32_t>> get_num_threads_async() const
```

```
std::vector<std::uint32_t> get_num_threads(error_code &ec = throws) const
```

```
components::component_type get_component_id(std::string const &name, error_code &ec = throws) const
```

Return a unique id usable as a component type.

This function returns the component type id associated with the given component name. If this is the first request for this component name a new unique id will be created.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **name** – [in] The component name (string) to get the component type for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns The function returns the currently associated component type. Any error results in an exception thrown from this function.

```
void iterate_types(iterate_types_function_type const &f, error_code &ec = throws) const
std::string get_component_type_name(components::component_type id, error_code &ec =
= throws) const
inline components::component_type register_factory(naming::gid_type const &locality_id,
std::string const &name, error_code &ec =
= throws) const
```

Register a factory for a specific component type.

This function allows to register a component factory for a given locality and component type.

Note: As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

Parameters

- **locality_id** – [in] The locality value uniquely identifying the given locality the factory needs to be registered for.
- **name** – [in] The component name (string) to register a factory for the given component type for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns The function returns the currently associated component type. Any error results in an exception thrown from this function. The returned component type is the same as if the function `get_component_id` was called using the same component name.

```
components::component_type register_factory(std::uint32_t locality_id, std::string const
&name, error_code &ec = throws) const
bool get_id_range(std::uint64_t count, naming::gid_type &lower_bound, naming::gid_type
&upper_bound, error_code &ec = throws)
```

Get unique range of freely assignable global ids.

Every locality needs to be able to assign global ids to different components without having to consult the AGAS server for every id to generate. This function can be called to preallocate a range of ids usable for this purpose.

Note: This function assigns a range of global ids usable by the given locality for newly created components. Any of the returned global ids still has to be bound to a local address, either by calling `bind` or `bind_range`.

Note: As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

Parameters

- **l** – [in] The locality the locality id needs to be generated for. Repeating calls using the same locality results in identical locality_id values.

- **count** – [in] The number of global ids to be generated.
- **lower_bound** – [out] The lower bound of the assigned id range. The returned value can be used as the first id to assign. This is valid only, if the return value of this function is true.
- **upper_bound** – [out] The upper bound of the assigned id range. The returned value can be used as the last id to assign. This is valid only, if the return value of this function is true.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns This function returns *true* if a new range has been generated (it has been called for the first time for the given locality) and returns *false* if this locality already got a range assigned in an earlier call. Any error results in an exception thrown from this function.

```
inline bool bind_local(naming::gid_type const &id, naming::address const &addr, error_code&ec = throws)
```

Bind a global address to a local address.

Every element in the HPX namespace has a unique global address (global id). This global address has to be associated with a concrete local address to be able to address an instance of a component using its global address.

Note: As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

Note: Binding a gid to a local address sets its global reference count to one.

Parameters

- **id** – [in] The global address which has to be bound to the local address.
- **addr** – [in] The local address to be bound to the global address.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns This function returns *true*, if this global id got associated with an local address. It returns *false* otherwise.

```
inline hpx::future<bool> bind_async(naming::gid_type const &id, naming::address const &addr, std::uint32_t locality_id)
```

```
inline hpx::future<bool> bind_async(naming::gid_type const &id, naming::address const &addr, naming::gid_type const &locality)
```

```
bool bind_range_local(naming::gid_type const &lower_id, std::uint64_t count, naming::address const &baseaddr, std::uint64_t offset, error_code&ec = throws)
```

Bind unique range of global ids to given base address.

Every locality needs to be able to bind global ids to different components without having to consult the AGAS server for every id to bind. This function can be called to bind a range of consecutive global ids to a range of consecutive local addresses (separated by a given *offset*).

Note: As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

Note: Binding a gid to a local address sets its global reference count to one.

Parameters

- **lower_id** – [in] The lower bound of the assigned id range. The value can be used as the first id to assign.
- **count** – [in] The number of consecutive global ids to bind starting at *lower_id*.
- **baseaddr** – [in] The local address to bind to the global id given by *lower_id*. This is the base address for all additional local addresses to bind to the remaining global ids.
- **offset** – [in] The offset to use to calculate the local addresses to be bound to the range of global ids.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true*, if the given range was successfully bound. It returns *false* otherwise.

```
hpx::future<bool> bind_range_async(naming::gid_type const &lower_id, std::uint64_t count,
                                     naming::address const &baseaddr, std::uint64_t offset,
                                     naming::gid_type const &locality)
```

```
inline hpx::future<bool> bind_range_async(naming::gid_type const &lower_id, std::uint64_t
                                           count, naming::address const &baseaddr,
                                           std::uint64_t offset, std::uint32_t locality_id)
```

```
inline bool unbind_local(naming::gid_type const &id, error_code &ec = throws)
```

Unbind a global address.

Remove the association of the given global address with any local address, which was bound to this global address. Additionally it returns the local address which was bound at the time of this call.

Note: You can unbind only global ids bound using the function *bind*. Do not use this function to unbind any of the global ids bound using *bind_range*.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: This function will raise an error if the global reference count of the given gid is not zero!

Parameters

- **id** – [in] The global address (id) for which the association has to be removed.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The function returns *true* if the association has been removed, and it returns *false* if no association existed. Any error results in an exception thrown from this function.

```
inline bool unbind_local(naming::gid_type const &id, naming::address &addr, error_code &ec =
                           throws)
```

Unbind a global address.

Remove the association of the given global address with any local address, which was bound to this global address. Additionally it returns the local address which was bound at the time of this call.

Note: You can unbind only global ids bound using the function *bind*. Do not use this function to unbind any of the global ids bound using *bind_range*.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: This function will raise an error if the global reference count of the given gid is not zero!

Parameters

- **id** – [in] The global address (id) for which the association has to be removed.
- **addr** – [out] The local address which was associated with the given global address (id). This is valid only if the return value of this function is true.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The function returns *true* if the association has been removed, and it returns *false* if no association existed. Any error results in an exception thrown from this function.

```
inline bool unbind_range_local(naming::gid_type const &lower_id, std::uint64_t count,  
                           error_code &ec = throws)
```

Unbind the given range of global ids.

Note: You can unbind only global ids bound using the function *bind_range*. Do not use this function to unbind any of the global ids bound using *bind*.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: This function will raise an error if the global reference count of the given gid is not zero!

Parameters

- **lower_id** – [in] The lower bound of the assigned id range. The value must be the first id of the range as specified to the corresponding call to *bind_range*.
- **count** – [in] The number of consecutive global ids to unbind starting at *lower_id*. This number must be identical to the number of global ids bound by the corresponding call to *bind_range*.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if a new range has been generated (it has been called for the first time for the given locality) and returns *false* if this locality already got a range assigned in an earlier call. Any error results in an exception thrown from this function.

```
bool unbind_range_local(naming::gid_type const &lower_id, std::uint64_t count,  
                        naming::address &addr, error_code &ec = throws)
```

Unbind the given range of global ids.

Note: You can unbind only global ids bound using the function `bind_range`. Do not use this function to unbind any of the global ids bound using `bind`.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Note: This function will raise an error if the global reference count of the given gid is not zero!

Parameters

- **lower_id** – [in] The lower bound of the assigned id range. The value must be the first id of the range as specified to the corresponding call to `bind_range`.
- **count** – [in] The number of consecutive global ids to unbind starting at `lower_id`. This number must be identical to the number of global ids bound by the corresponding call to `bind_range`
- **addr** – [out] The local address which was associated with the given global address (id). This is valid only if the return value of this function is true.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns This function returns `true` if a new range has been generated (it has been called for the first time for the given locality) and returns `false` if this locality already got a range assigned in an earlier call.

`hpx::future<naming::address> unbind_range_async(naming::gid_type const &lower_id,
std::uint64_t count = 1)`

`inline bool is_local_address_cached(naming::gid_type const &id, error_code &ec = throws)`

Test whether the given address refers to a local object.

This function will test whether the given address refers to an object living on the locality of the caller.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Parameters

- **id** – [in] The address to test.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns This function returns `true` if the passed address refers to an object which lives on the locality of the caller.

`bool is_local_address_cached(naming::gid_type const &id, naming::address &addr,
error_code &ec = throws)`

```
bool is_local_address_cached(naming::gid_type const &id, naming::address &addr,  
                           std::pair<bool, components::pinned_ptr> &r,  
                           hpx::move_only_function<std::pair<bool,  
                           components::pinned_ptr>(<naming::address const&)> &&f,  
                           error_code &ec = throws)  
  
bool is_local_lva_encoded_address(std::uint64_t msb) const  
  
inline bool resolve_local(naming::gid_type const &id, naming::address &addr, error_code &ec =  
                           throws)
```

Resolve a given global address (*id*) to its associated local address.

This function returns the local address which is currently associated with the given global address (*id*).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The global address (*id*) for which the associated local address should be returned.
- **addr** – [out] The local address which currently is associated with the given global address (*id*), this is valid only if the return value of this function is true.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns *true* if the global address has been resolved successfully (there exists an association to a local address) and the associated local address has been returned. The function returns *false* if no association exists for the given global address. Any error results in an exception thrown from this function.

```
inline bool resolve_local(hpx::id_type const &id, naming::address &addr, error_code &ec =  
                           throws)  
  
inline naming::address resolve_local(naming::gid_type const &id, error_code &ec = throws)  
  
inline naming::address resolve_local(hpx::id_type const &id, error_code &ec = throws)  
  
hpx::future_or_value<naming::address> resolve_async(naming::gid_type const &id)  
  
inline hpx::future_or_value<naming::address> resolve_async(hpx::id_type const &id)  
  
hpx::future_or_value<id_type> get_colocation_id_async(hpx::id_type const &id)  
  
bool resolve_full_local(naming::gid_type const &id, naming::address &addr, error_code &ec =  
                           throws)  
  
inline bool resolve_full_local(hpx::id_type const &id, naming::address &addr, error_code &ec =  
                           throws)  
  
inline naming::address resolve_full_local(naming::gid_type const &id, error_code &ec =  
                           throws)  
  
inline naming::address resolve_full_local(hpx::id_type const &id, error_code &ec = throws)  
  
hpx::future_or_value<naming::address> resolve_full_async(naming::gid_type const &id)
```

```
inline hpx::future_or_value<naming::address> resolve_full_async(hpx::id_type const &id)
bool resolve_cached(naming::gid_type const &id, naming::address &addr, error_code &ec =
    throws)
inline bool resolve_cached(hpx::id_type const &id, naming::address &addr, error_code &ec =
    throws)
inline bool resolve_local(naming::gid_type const *gids, naming::address *addrs, std::size_t size,
    hpx::detail::dynamic_bitset<> &locals, error_code &ec = throws)
bool resolve_full_local(naming::gid_type const *gids, naming::address *addrs, std::size_t size,
    hpx::detail::dynamic_bitset<> &locals, error_code &ec = throws)
bool resolve_cached(naming::gid_type const *gids, naming::address *addrs, std::size_t size,
    hpx::detail::dynamic_bitset<> &locals, error_code &ec = throws)
hpx::future_or_value<std::int64_t> inref_async(naming::gid_type const &gid, std::int64_t
    credits = 1, hpx::id_type const &keep_alive =
    hpx::invalid_id)
```

Increment the global reference count for the given id.

Note: As long as *ec* is not pre-initialized to *hpx*::*throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx*::exception.

Parameters

- **gid** – [in] The global address (id) for which the global reference count has to be incremented.
- **credits** – [in] The number of reference counts to add for the given id.
- **keep_alive** – [in] Id to keep alive (if valid)
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx*::*throws* the function will throw on error instead.

Returns Whether the operation was successful.

```
inline std::int64_t inref(naming::gid_type const &gid, std::int64_t credits = 1, error_code &ec =
    throws)
```

```
void decref(naming::gid_type const &id, std::int64_t credits = 1, error_code &ec = throws)
```

Decrement the global reference count for the given id.

Note: As long as *ec* is not pre-initialized to *hpx*::*throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx*::exception.

Parameters

- **id** – [in] The global address (id) for which the global reference count has to be decremented.
- **t** – [out] If this was the last outstanding global reference for the given gid (the return value of this function is zero), t will be set to the component type of the corresponding element. Otherwise t will not be modified.
- **credits** – [in] The number of reference counts to add for the given id.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx*::*throws* the function will throw on error instead.

Returns The global reference count after the decrement.

hpx::future<iterate_names_return_type> **iterate_ids**(*std::string const &pattern*) const

Invoke the supplied *hpx::function* for every registered global name.

This function iterates over all registered global ids and returns every found entry matching the given name pattern. Any error results in an exception thrown (or reported) from this function.

Parameters **pattern** – [in] pattern (possibly using wildcards) to match all existing entries against

bool register_name(*std::string const &name*, *naming::gid_type const &id*, *error_code &ec = throws*) const

Register a global name with a global address (id)

This function registers an association between a global name (string) and a global address (id) usable with one of the functions above (bind, unbind, and resolve).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **name** – [in] The global name (string) to be associated with the global address.
- **id** – [in] The global address (id) to be associated with the global address.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The function returns *true* if the global name was registered. It returns false if the global name is not registered.

hpx::future<bool> **register_name_async**(*std::string const &name*, *hpx::id_type const &id*) const

bool register_name(*std::string const &name*, *hpx::id_type const &id*, *error_code &ec = throws*) const

hpx::future<hpx::id_type> **unregister_name_async**(*std::string const &name*) const

Unregister a global name (release any existing association)

This function releases any existing association of the given global name with a global address (id).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **name** – [in] The global name (string) for which any association with a global address (id) has to be released.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The function returns *true* if an association of this global name has been released, and it returns *false*, if no association existed. Any error results in an exception thrown from this function.

hpx::id_type unregister_name(*std::string const &name*, *error_code &ec = throws*) const

hpx::future<hpx::id_type> **resolve_name_async**(*std::string const &name*) const

Query for the global address associated with a given global name.

This function returns the global address associated with the given global name.

This function returns true if it returned global address (id), which is currently associated with the given global name, and it returns false, if currently there is no association for this global name. Any error results in an exception thrown from this function.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Parameters

- **name** – [in] The global name (string) for which the currently associated global address has to be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns [out] The id currently associated with the given global name (valid only if the return value is true).

```
hpx::id_type resolve_name(std::string const &name, error_code &ec = throws) const
future<hpx::id_type> on_symbol_namespace_event(std::string const &name, bool
call_for_past_events = false) const
```

Install a listener for a given symbol namespace event.

This function installs a listener for a given symbol namespace event. It returns a future which becomes ready as a result of the listener being triggered.

Note: The only event type which is currently supported is `symbol_ns_bind`, i.e. the listener is triggered whenever a global id is registered with the given name.

Parameters

- **name** – [in] The global name (string) for which the given event should be triggered.
- **evt** – [in] The event for which a listener should be installed.
- **call_for_past_events** – [in, optional] Trigger the listener even if the given event has already happened in the past. The default for this parameter is `false`.

Returns A future instance encapsulating the global id which is causing the registered listener to be triggered.

```
void update_cache_entry(naming::gid_type const &gid, gva const &gva, error_code &ec =
throws)
```

Warning: This function is for internal use only. It is dangerous and may break your code if you use it.

```
inline void update_cache_entry(naming::gid_type const &gid, naming::address const &addr,
std::uint64_t count = 0, std::uint64_t offset = 0, error_code &ec =
throws)
```

Warning: This function is for internal use only. It is dangerous and may break your code if you use it.

```
bool get_cache_entry(naming::gid_type const &gid, gva &gva, naming::gid_type &idbase,
error_code &ec = throws) const
```

Warning: This function is for internal use only. It is dangerous and may break your code if you use it.

```
void remove_cache_entry(naming::gid_type const &id, error_code &ec = throws) const
```

Warning: This function is for internal use only. It is dangerous and may break your code if you use it.

```
void clear_cache(error_code &ec = throws) const
```

Warning: This function is for internal use only. It is dangerous and may break your code if you use it.

```
void start_shutdown(error_code &ec = throws)
```

hpx::future<std::pair<hpx::id_type, naming::address>> **begin_migration**(*hpx::id_type const &id*)
start/stop migration of an object

Returns Current locality and address of the object to migrate

```
bool end_migration(hpx::id_type const &id)
```

std::pair<bool, components::pinned_ptr> **was_object_migrated**(*naming::gid_type const &gid,*
hpx::move_only_function<components::pinned_ptr> &&f)

Maintain list of migrated objects.

hpx::future<void> **mark_as_migrated**(*naming::gid_type const &gid,*
hpx::move_only_function<std::pair<bool,
hpx::future<void>>() &&f, bool
expect_to_be_marked_as_migrating)

Mark the given object as being migrated (if the object is unpinned). Delay migration until the object is unpinned otherwise.

```
void unmark_as_migrated(naming::gid_type const &gid_, hpx::move_only_function<void()>  
&&f)
```

Remove the given object from the table of migrated objects.

```

namespace **server**

AGAS's primary namespace maps 128-bit global identifiers (GIDs) to resolved addresses.

The following is the canonical description of the partitioning of AGAS's primary namespace.

-----MSB----- -----LSB-----
BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB
prefix RC ---identifier---
<p>MSB - Most significant bits (bit 64 to bit 127)</p> <p>LSB - Least significant bits (bit 0 to bit 63)</p> <p>prefix - Highest 32 bits (bit 96 to bit 127) of the MSB. Each locality is assigned a prefix. This creates a 96-bit address space for each locality.</p> <p>RC - Bit 88 to bit 92 of the MSB. This is the log₂ of the number of reference counting credits on the GID. Bit 93 is used by the locking scheme for gid_types. Bit 94 is a flag which is set if the credit value is valid. Bit 95 is a flag that is set if a GID's credit count is ever split (e.g. if the GID is ever passed to another locality). - Bit 87 marks the gid such that it will not be stored in any of the AGAS caches. This is used mainly for ids</p>

(continues on next page)

(continued from previous page)

which represent 'one-shot' objects (like promises).

identifier - Bit 64 to bit 86 of the MSB, and the entire LSB. The content of these bits depends on the component type of the underlying object. For all user-defined components, these bits contain a unique 88-bit number which is assigned sequentially for each locality. For `\a hpx#components#component_enum_type#runtime_support` the high 24 bits are zeroed and the low 64 bits hold the LVA of the component.

The following address ranges are reserved. Some are either explicitly or implicitly protected by AGAS. The letter x represents a single-byte wild card.

```
00000000xxxxxxxxxxxxxxxxxxxxx
    Historically unused address space reserved for future use.
xxxxxxxxxx000xxxxxxxxxxxxx
    Address space for LVA-encoded GIDs.
00000001xxxxxxxxxxxxxxxxxxxx
    Prefix of the bootstrap AGAS locality.
0000000100000000100000000000000001
    Address of the primary_namespace component on the bootstrap AGAS
    locality.
000000010000000010000000000000000002
    Address of the component_namespace component on the bootstrap AGAS
    locality.
000000010000000010000000000000000003
    Address of the symbol_namespace component on the bootstrap AGAS
    locality.
000000010000000010000000000000000004
    Address of the locality_namespace component on the bootstrap AGAS
    locality.
```

Note: The layout of the address space is implementation defined, and subject to change. Never write application code that relies on the internal layout of GIDs. AGAS only guarantees that all assigned GIDs will be unique.

async_colocated

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx::get_colocation_id

Defined in header `hpx/runtime.hpp`⁷⁸⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

`hpx::id_type get_colocation_id(launch::sync_policy, hpx::id_type const &id, error_code &ec = throws)`

Return the id of the locality where the object referenced by the given id is currently located on.

The function `hpx::get_colocation_id()` returns the id of the locality where the given object is currently located.

See also:

`hpx::get_colocation_id()`

Note: As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

Parameters

- **id** – [in] The id of the object to locate.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

⁷⁸⁹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/runtime.hpp>

`hpx::future<hpx::id_type> get_colocation_id(hpx::id_type const &id)`

Asynchronously return the id of the locality where the object referenced by the given id is currently located on.

See also:

`hpx::get_colocation_id(launch::sync_policy)`

Parameters **id** – [in] The id of the object to locate.

async_distributed

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx::async (distributed)

Defined in header `hpx/async.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

template<typename **Action**, typename **Target**, typename ...**Ts**>
auto **async**(*Action* &&*action*, *Target* &&*target*, *Ts*&&... *ts*)

The distributed implementation of `hpx::async` can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID. The action executes asynchronously.

Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed
- **Ts** – The type of any additional arguments

Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

Returns `hpx::future` referring to the shared state created by this call to `hpx::async`

hpx/async_distributed/base_lco.hpp

Defined in header `hpx/async_distributed/base_lco.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<>

```
struct hpx::get_lva<hpx::lcos::base_lco>

static inline constexpr hpx::lcos::base_lco const *call(hpx::naming::address_type lva) noexcept
```

namespace `lcos`

class `base_lco`

`#include <base_lco.hpp>` The `base_lco` class is the common base class for all LCO's implementing a simple `set_event` action

Subclassed by `hpx::lcos::base_lco_with_value< Result, RemoteResult, ComponentTag >, hpx::lcos::base_lco_with_value< void, void, ComponentTag >`

Public Types

```
typedef components::managed_component<base_lco> wrapping_type
```

```
typedef base_lco base_type_holder
```

Public Functions

```
virtual void set_event() = 0
```

```
virtual void set_exception(std::exception_ptr const &e)
```

```
virtual void connect(hpx::id_type const&)
```

```
virtual void disconnect(hpx::id_type const&)
```

```
virtual ~base_lco()
```

Destructor, needs to be virtual to allow for clean destruction of derived objects

```
void set_event_nonvirt()
```

The *function* `set_event_nonvirt` is called whenever a *set_event_action* is applied on a instance of a LCO. This function just forwards to the virtual function `set_event`, which is overloaded by the derived concrete LCO.

```
void set_exception_nonvirt(std::exception_ptr const &e)
```

The *function* `set_exception` is called whenever a *set_exception_action* is applied on a instance of a LCO. This function just forwards to the virtual function `set_exception`, which is overloaded by the derived concrete LCO.

Parameters `e` – [in] The exception encapsulating the error to report to this LCO instance.

```
void connect_nonvirt(hpx::id_type const &id)
```

The *function* `connect_nonvirt` is called whenever a *connect_action* is applied on a instance of a LCO. This function just forwards to the virtual function `connect`, which is overloaded by the derived concrete LCO.

Parameters `id` – [in] target id

```
void disconnect_nonvirt(hpx::id_type const &id)
```

The *function* `disconnect_nonvirt` is called whenever a *disconnect_action* is applied on a instance of a LCO. This function just forwards to the virtual function `disconnect`, which is overloaded by the derived concrete LCO.

Parameters `id` – [in] target id

```
HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco, set_event_nonvirt,  
set_event_action) HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco
```

Each of the exposed functions needs to be encapsulated into an action type, allowing to generate all required boilerplate code for threads, serialization, etc.

The *set_event_action* may be used to unconditionally trigger any LCO instances, it carries no additional parameters. The *set_exception_action* may be used to transfer arbitrary error information from the remote site to the LCO instance specified as a continuation. This action carries 2 parameters:

Parameters `std::exception_ptr` – [in] The exception encapsulating the error to report to this LCO instance.

```
set_exception_action HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco,
connect_nonvirt, connect_action) HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco
```

The *connect_action* may be used to.

The *set_exception_action* may be used to

namespace **hpx**

namespace **components**

namespace **lcos**

```
template<typename Result, typename RemoteResult, typename ComponentTag>
```

```
class base_lco_with_value : public hpx::lcos::base_lco, public ComponentTag
```

```
#include <base_lco_with_value.hpp> The base_lco_with_value class is the common base class for all LCO's synchronizing on a value. The RemoteResult template argument should be set to the type of the argument expected for the set_value action.
```

Template Parameters

- **RemoteResult** – The type of the result value to be carried back to the LCO instance.
- **ComponentTag** – The tag type representing the type of the component (either **component_tag** or **managed_component_tag**).

Public Types

```
using wrapping_type = typename detail::base_lco_wrapping_type<ComponentTag,  
base_lco_with_value>::type
```

```
using base_type_holder = base_lco_with_value
```

Public Functions

```
inline void set_value_nonvirt(RemoteResult &&result)
```

The *function* **set_value_nonvirt** is called whenever a *set_value_action* is applied on this LCO instance. This function just forwards to the virtual function **set_value**, which is overloaded by the derived concrete LCO.

Parameters **result** – [in] The result value to be transferred from the remote operation back to this LCO instance.

```
inline Result get_value_nonvirt()
```

The *function* **get_result_nonvirt** is called whenever a *get_result_action* is applied on this LCO instance. This function just forwards to the virtual function **get_result**, which is overloaded by the derived concrete LCO.

```
HPX_DEFINE_COMPONENT_DIRECT_ACTION (base_lco_with_value, set_value_nonvirt,
set_value_action) HPX_DEFINE_COMPONENT_DIRECT_ACTION(base_lco_with_value
```

The *set_value_action* may be used to trigger any LCO instances while carrying an additional parameter of any type.

RemoteResult is taken by rvalue ref. This allows for perfect forwarding. When the action thread function is created, the values are moved into the called function. If we took it by const lvalue reference, we would disable the possibility to further move the result to the designated destination.

Parameters **RemoteResult** – [in] The type of the result to be transferred back to this LCO instance. The *get_value_action* may be used to query the value this LCO instance exposes as its ‘result’ value.

namespace traits
```

hpx::dataflow (distributed)

Defined in header hpx/async.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

Functions

```
template<typename Action, typename Target, typename ...Ts>  
decltype(auto) dataflow(Action &&action, Target &&target, Ts&&... ts)
```

The distributed implementation of `hpx::dataflow` can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID. The action executes asynchronously.

Note: Its behavior is similar to `hpx::async` with the exception that if one of the arguments is a future, then `hpx::dataflow` will wait for the future to be ready to launch the thread.

Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed
- **Ts** – The type of any additional arguments

Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

Returns `hpx::future` referring to the shared state created by this call to `hpx::dataflow`

`hpx::distributed::promise`

Defined in header `hpx/future.hpp`⁷⁹⁰.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace `hpx`

namespace `distributed`

```
template<typename Result, typename RemoteResult>
```

```
class promise
```

`#include <promise.hpp>` A promise can be used by a single *thread* to invoke a (remote) action and wait for the result. The result is expected to be sent back to the promise using the LCO's `set_event` action

A promise is one of the simplest synchronization primitives provided by HPX. It allows to synchronize on a eager evaluated remote operation returning a result of the type `Result`. The `promise` allows to synchronize exactly one *thread* (the one passed during construction time).

```
// Create the promise (the expected result is a id_type)
hpx::distributed::promise<hpx::id_type> p;

// Get the associated future
future<hpx::id_type> f = p.get_future();

// initiate the action supplying the promise as a
// continuation
apply<some_action>(<b>new</b> continuation(p.get_id()), ...);

// Wait for the result to be returned, yielding control
// in the meantime.
hpx::id_type result = f.get();
// ...
```

Note: The action executed by the promise must return a value of a type convertible to the type as specified by the template parameter `RemoteResult`

Template Parameters

- **Result** – The template parameter `Result` defines the type this promise is expected to return from `promise::get`.

⁷⁹⁰ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/future.hpp>

- **RemoteResult** – The template parameter *RemoteResult* defines the type this promise is expected to receive from the remote action.

namespace **lcos**

TypeDefs

```
using instead = hpx::distributed::promise<Result, RemoteResult>

template<typename Result, typename RemoteResult, typename ComponentTag>
class base_lco_with_value : public hpx::lcos::base_lco, public ComponentTag
    #include <base_lco_with_value.hpp>

template<typename Action, typename Result = typename traits::promise_local_result<typename Action::remote_result_type>::type, bool DirectExecute = Action::direct_execution::value>
class packaged_action
    #include <packaged_action.hpp> A packaged_action can be used by a single thread to invoke a (remote) action and wait for the result. The result is expected to be sent back to the packaged_action using the LCO's set_event action

A packaged_action is one of the simplest synchronization primitives provided by HPX. It allows to synchronize on a eager evaluated remote operation returning a result of the type Result.
```

Note: The action executed using the *packaged_action* as a continuation must return a value of a type convertible to the type as specified by the template parameter *Result*.

Template Parameters

- **Action** – The template parameter *Action* defines the action to be executed by this *packaged_action* instance. The arguments *arg0, ..., argN* are used as parameters for this action.
- **Result** – The template parameter *Result* defines the type this *packaged_action* is expected to return from its associated future *packaged_action::get_future*.
- **DirectExecute** – The template parameter *DirectExecute* is an optimization aid allowing to execute the action directly if the target is local (without spawning a new thread for this). This template does not have to be supplied explicitly as it is derived from the template parameter *Action*.

namespace **lcos**

hpx/async_distributed/packaged_action.hpp

Defined in header hpx/async_distributed/packaged_action.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **lcos**

```
template<typename Action, typename Result = typename traits::promise_local_result<typename Action::remote_result_type>::type, bool DirectExecute = Action::direct_execution::value>
class packaged_action

    #include <packaged_action.hpp>

template<typename Action, typename Result>
class packaged_action<Action, Result, false> : public hpx::distributed::promise<Result, hpx::traits::extract_action<Action>::remote_result_type>
    Subclassed by hpx::lcos::packaged_action<Action, Result, true >
```

Public Functions

```
inline packaged_action()

template<typename Allocatorpackaged_action(std::allocator_arg_t, Allocator const &alloc)

template<typename ...Ts>
inline void post(hpx::id_type const &id, Ts&&... vs)

template<typename ...Ts>
inline void post(naming::address &&addr, hpx::id_type const &id, Ts&&... vs)

template<typename Callback, typename ...Ts>
inline void post_cb(hpx::id_type const &id, Callback &&cb, Ts&&... vs)

template<typename Callback, typename ...Ts>

                     Callback &&cb, Ts&&... vs)  
  
template<typename Callback, typename ...Ts>  
inline void do_post_cb(hpx::id_type const &id, hpx::launch policy, Callback &&cb, Ts&&... vs)  
  
template<typename Action, typename Result>  
class packaged_action<Action, Result, true> : public hpx::lcos::packaged_action<Action, Result,  
false>
```

Public Functions

```
inline packaged_action()  
Construct a (non-functional) instance of an packaged_action. To use this instance its member  
function post needs to be directly called.  
  
template<typename Allocator>  
inline packaged_action(std::allocator_arg_t, Allocator const &alloc)  
  
template<typename ...Ts>  
inline void post(hpx::id_type const &id, Ts&&... vs)  
  
template<typename ...Ts>  
inline void post(naming::address &&addr, hpx::id_type const &id, Ts&&... vs)  
  
template<typename Callback, typename ...Ts>  
inline void post_cb(hpx::id_type const &id, Callback &&cb, Ts&&... vs)  
  
template<typename Callback, typename ...Ts>  
inline void post_cb(naming::address &&addr, hpx::id_type const &id, Callback &&cb, Ts&&... vs)
```

Private Types

```
using action_type = typename packaged_action<Action, Result, false>::action_type
```

hpx::post (distributed)

Defined in header `hpx/async.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename Action, typename Target, typename ...Ts>
bool post(Action &&action, Target &&target, Ts&&... ts)
```

The distributed implementation of `hpx::post` can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID.

Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed
- **Ts** – The type of any additional arguments

Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

Returns `true` if the action was successfully posted, `false` otherwise.

hpx/async_distributed/promise.hpp

Defined in header `hpx/async_distributed/promise.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

template<>

```
class hpx::distributed::promise<void, hpx::util::unused_type> : public lcos::detail::promise_base<void,
hpx::util::unused_type, lcos::detail::promise_data<void>>
```

Public Functions

promise() = default

constructs a promise object and a shared state.

template<typename **Allocator**>

inline **promise**(*std*::allocator_arg_t, *Allocator* const &a)

constructs a promise object and a shared state. The constructor uses the allocator a to allocate the memory for the shared state.

promise(*promise* &&*other*) noexcept = default

constructs a new promise object and transfers ownership of the shared state of other (if any) to the newly-constructed object.

Post other has no shared state.

~promise() = default

Abandons any shared state.

promise &**operator=**(*promise* &&*other*) noexcept = default

Abandons any shared state (30.6.4) and then as if *promise*(*HPX_MOVE*(*other*)).*swap*(*this).

Returns *this.

inline void **swap**(*promise* &*other*) noexcept

Exchanges the shared state of *this and other.

Post *this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that *this had prior to the call to swap.

inline void **set_value()**

atomically stores the value r in the shared state and makes that state ready (30.6.4).

Throws *future_error* – if its shared state already has a stored value. if shared state has no stored value exception is raised. *promise_already_satisfied* if its shared state already has a stored value or exception. *no_state* if *this has no shared state.

Private Types

```
using base_type = lcos::detail::promise_base<void, hpx::util::unused_type,  
lcos::detail::promise_data<void>>
```

template<typename R, typename **Allocator**>

struct **uses_allocator**<*hpx*::distributed::promise<R>, *Allocator*> : public true_type

#include <promise.hpp> Requires: Allocator shall be an allocator (17.6.3.5)

namespace **hpx**

namespace **distributed**

Functions

```
template<typename Result, typename RemoteResult>
void swap(promise<Result, RemoteResult> &x, promise<Result, RemoteResult> &y) noexcept

template<typename Result, typename RemoteResult>
class promise
    #include <promise.hpp>

template<> unused_type > : public lcos::detail::promise_base< void,
hpx::util::unused_type, lcos::detail::promise_data< void > >
```

Public Functions

promise() = default

constructs a promise object and a shared state.

template<typename Allocator>

inline promise(*std*::allocator_arg_t, *Allocator* const &a)

constructs a promise object and a shared state. The constructor uses the allocator a to allocate the memory for the shared state.

promise(*promise* &&other) noexcept = default

constructs a new promise object and transfers ownership of the shared state of other (if any) to the newly-constructed object.

Post other has no shared state.

~promise() = default

Abandons any shared state.

promise &operator=(*promise* &&other) noexcept = default

Abandons any shared state (30.6.4) and then as if *promise*(HPX_MOVE(other)).*swap*(*this).

Returns *this.

inline void swap(*promise* &other) noexcept

Exchanges the shared state of *this and other.

Post *this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that *this had prior to the call to swap.

inline void set_value()

atomically stores the value r in the shared state and makes that state ready (30.6.4).

Throws future_error – if its shared state already has a stored value. if shared state has no stored value exception is raised. *promise_already_satisfied* if its shared state already has a stored value or exception. *no_state* if *this has no shared state.

Private Types

```
using base_type = lcos::detail::promise_base<void, hpx::util::unused_type,  
lcos::detail::promise_data<void>>
```

namespace **std**

```
template<typename R, typename Allocator> promise< R >,  
Allocator > : public true_type
```

#include <promise.hpp> Requires: Allocator shall be an allocator (17.6.3.5)

hpx::sync (distributed)

Defined in header hpx/async.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename Action, typename Target, typename ...Ts>  
decltype(auto) sync(Action &&action, Target &&target, Ts&&... ts)
```

The distributed implementation of `hpx::sync` can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID. The action executes synchronously.

Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed
- **Ts** – The type of any additional arguments

Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

Returns `hpx::future` referring to the shared state created by this call to `hpx::sync`

hpx/async_distributed/transfer_continuation_action.hpp

Defined in header `hpx/async_distributed/transfer_continuation_action.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

hpx/async_distributed/trigger_lco.hpp

Defined in header `hpx/async_distributed/trigger_lco.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

hpx/async_distributed/trigger_lco_fwd.hpp

Defined in header `hpx/async_distributed/trigger_lco_fwd.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Functions

`void trigger_lco_event(hpx::id_type id, naming::address &&addr, bool move_credits = true)`

Trigger the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should be triggered.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

`inline void trigger_lco_event(hpx::id_type const &id, bool move_credits = true)`

Trigger the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should be triggered.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

`void trigger_lco_event(hpx::id_type id, naming::address &&addr, hpx::id_type const &cont, bool move_credits = true)`

Trigger the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should be triggered.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **cont** – [in] This represents the LCO to trigger after completion.

- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
inline void trigger_lco_event(hpx::id_type const &id, hpx::id_type const &cont, bool move_credits = true)
```

Trigger the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should be triggered.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
template<typename Result>  
void set_lco_value(hpx::id_type id, naming::address &&addr, Result &&t, bool move_credits = true)
```

Set the result value for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **t** – [in] This is the value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
template<typename Result>  
std::enable_if_t<!std::is_same_v<std::decay_t<Result>, naming::address>> set_lco_value(hpx::id_type  
const &id,  
Result &&t,  
bool  
move_credits =  
true)
```

Set the result value for the (managed) LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
template<typename Result>  
std::enable_if_t<!std::is_same_v<std::decay_t<Result>, naming::address>> set_lco_value_unmanaged(hpx::id_type  
const &id,  
Result &&t,  
bool  
move_credits =  
true)
```

Set the result value for the (unmanaged) LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
template<typename Result>
void set_lco_value(hpx::id_type id, naming::address &&addr, Result &&t, hpx::id_type const &cont, bool move_credits = true)
```

Set the result value for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **t** – [in] This is the value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
template<typename Result>
std::enable_if_t<!std::is_same_v<std::decay_t<Result>, naming::address>> set_lco_value(hpx::id_type
const &id,
Result &&t,
hpx::id_type
const &cont,
bool
move_credits =
true)
```

Set the result value for the (managed) LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
template<typename Result>
std::enable_if_t<!std::is_same_v<std::decay_t<Result>, naming::address>> set_lco_value_unmanaged(hpx::id_type
const
&id,
Result
&&t,
hpx::id_type
const
&cont,
bool
move_credits
=
true)
```

Set the result value for the (unmanaged) LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the given value.
- **t** – [in] This is the value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(hpx::id_type id, naming::address &&addr, std::exception_ptr const &e, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(hpx::id_type id, naming::address &&addr, std::exception_ptr &&e, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
inline void set_lco_error(hpx::id_type const &id, std::exception_ptr const &e, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
inline void set_lco_error(hpx::id_type const &id, std::exception_ptr &&e, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.

- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(hpx::id_type id, naming::address &&addr, std::exception_ptr const &e, hpx::id_type const &cont, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
void set_lco_error(hpx::id_type id, naming::address &&addr, std::exception_ptr &&e, hpx::id_type const &cont, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **addr** – [in] This represents the addr of the LCO which should be triggered.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
inline void set_lco_error(hpx::id_type const &id, std::exception_ptr const &e, hpx::id_type const &cont, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

```
inline void set_lco_error(hpx::id_type const &id, std::exception_ptr &&e, hpx::id_type const &cont, bool move_credits = true)
```

Set the error state for the LCO referenced by the given id.

Parameters

- **id** – [in] This represents the id of the LCO which should receive the error value.
- **e** – [in] This is the error value which should be sent to the LCO.
- **cont** – [in] This represents the LCO to trigger after completion.
- **move_credits** – [in] If this is set to *true* then it is ok to send all credits in *id* along with the generated message. The default value is *true*.

checkpoint

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/checkpoint/checkpoint.hpp

Defined in header hpx/checkpoint/checkpoint.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

This header defines the save_checkpoint and restore_checkpoint functions. These functions are designed to help HPX application developer's checkpoint their applications. Save_checkpoint serializes one or more objects and saves them as a byte stream. Restore_checkpoint converts the byte stream back into instances of the objects.

namespace **hpx**

namespace **util**

Functions

inline `std::ostream &operator<<(std::ostream &ost, checkpoint const &ckp)`
Operator<< Overload

This overload is the main way to write data from a checkpoint to an object such as a file. Inside the function, the size of the checkpoint will be written to the stream before the checkpoint's data. The operator>> overload uses this to read the correct number of bytes. Be mindful of this additional write and read when you use different facilities to write out or read in data to a checkpoint!

Parameters

- **ost** – Output stream to write to.
- **ckp** – Checkpoint to copy from.

Returns Operator<< returns the ostream object.

inline `std::istream &operator>>(std::istream &ist, checkpoint &ckp)`
Operator>> Overload

This overload is the main way to read in data from an object such as a file to a checkpoint. It is important to note that inside the function, the first variable to be read is the size of the checkpoint. This size variable is written to the stream before the checkpoint's data in the operator<< overload. Be mindful of this additional read and write when you use different facilities to read in or write out data from a checkpoint!

Parameters

- **ist** – Input stream to write from.
- **ckp** – Checkpoint to write to.

Returns Operator>> returns the ostream object.

template<typename T, typename ...Ts, typename U = typename
`std::enable_if<!hpx::traits::is_launch_policy<T>::value && !std::is_same<typename`
`std::decay<T>::type, checkpoint>::value>::type>`

`hpx::future<checkpoint> save_checkpoint(T &&t, Ts&&... ts)`

Save_checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **U** – This parameter is used to make sure that T is not a launch policy or a checkpoint. This forces the compiler to choose the correct overload.

Parameters

- **t** – A container to restore.
- **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save_checkpoint will simply return a checkpoint.

`template<typename T, typename ...Ts>`

`hpx::future<checkpoint> save_checkpoint(checkpoint &&c, T &&t, Ts&&... ts)`

Save_checkpoint - Take a pre-initialized checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.

Parameters

- **c** – Takes a pre-initialized checkpoint to copy data into.
- **t** – A container to restore.
- **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save_checkpoint will simply return a checkpoint.

`template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<typename std::decay<T>::type, checkpoint>::value>::type>`

`hpx::future<checkpoint> save_checkpoint(hpx::launch p, T &&t, Ts&&... ts)`

Save_checkpoint - Policy overload

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.

Parameters

- **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save_checkpoint will simply return a checkpoint.

```
template<typename T, typename ...Ts>
hpx::future<checkpoint> save_checkpoint(hpx::launch p, checkpoint &&c, T &&t, Ts&&... ts)
```

Save_checkpoint - Policy overload & pre-initialized checkpoint

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.

Parameters

- **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- **c** – Takes a pre-initialized checkpoint to copy data into.
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint returns a future to a checkpoint with one exception: if you pass hpx::launch::sync as the first argument. In this case save_checkpoint will simply return a checkpoint.

```
template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<typename
std::decay<T>::type, checkpoint>::value>::type>
checkpoint save_checkpoint(hpx::launch::sync_policy sync_p, T &&t, Ts&&... ts)
```

Save_checkpoint - Sync_policy overload

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the

component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **U** – This parameter is used to make sure that T is not a checkpoint. This forces the compiler to choose the correct overload.

Parameters

- **sync_p** – hpx::launch::sync_policy
- **t** – A container to restore.
- **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint which is passed hpx::launch::sync_policy will return a checkpoint which contains the serialized values checkpoint.

```
template<typename T, typename ...Ts>
checkpoint save_checkpoint(hpx::launch::sync_policy sync_p, checkpoint &&c, T &&t, Ts&&... ts)
Save_checkpoint - Sync_policy overload & pre-init. checkpoint
```

Save_checkpoint takes any number of objects which a user may wish to store and returns a future to a checkpoint object. This function can also store a component either by passing a shared_ptr to the component or by passing a component's client instance to save_checkpoint. Additionally the function can take a policy as a first object which changes its behavior depending on the policy passed to it. Most notably, if a sync policy is used save_checkpoint will simply return a checkpoint object.

Template Parameters

- **T** – Containers passed to save_checkpoint to be serialized and placed into a checkpoint object.
- **Ts** – More containers passed to save_checkpoint to be serialized and placed into a checkpoint object.

Parameters

- **sync_p** – hpx::launch::sync_policy
- **c** – Takes a pre-initialized checkpoint to copy data into.
- **t** – A container to restore.
- **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Returns Save_checkpoint which is passed hpx::launch::sync_policy will return a checkpoint which contains the serialized values checkpoint.

```
template<typename T, typename ...Ts, typename U = typename
std::enable_if<!hpx::traits::is_launch_policy<T>::value && !std::is_same<typename
std::decay<T>::type, checkpoint>::value>::type>
hpx::future<checkpoint> prepare_checkpoint(T const &t, Ts const&... ts)
prepare_checkpoint
```

prepare_checkpoint takes the containers which have to be filled from the byte stream by a subsequent restore_checkpoint invocation. prepare_checkpoint will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

Template Parameters

- **T** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters

- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns `prepare_checkpoint` returns a properly resized checkpoint object that can be used for a subsequent `restore_checkpoint` operation.

```
template<typename T, typename ...Ts>
hpx::future<checkpoint> prepare_checkpoint(checkpoint &&c, T const &t, Ts const&... ts)
```

```
    prepare_checkpoint
```

`prepare_checkpoint` takes the containers which have to be filled from the byte stream by a subsequent `restore_checkpoint` invocation. `prepare_checkpoint` will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

Template Parameters

- **T** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters

- **c** – Takes a pre-initialized checkpoint to prepare
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns `prepare_checkpoint` returns a properly resized checkpoint object that can be used for a subsequent `restore_checkpoint` operation.

```
template<typename T, typename ...Ts, typename U = typename std::enable_if<!std::is_same<T,
checkpoint>::value>::type>
```

```
hpx::future<checkpoint> prepare_checkpoint(hpx::launch p, T const &t, Ts const&... ts)
```

```
    prepare_checkpoint
```

`prepare_checkpoint` takes the containers which have to be filled from the byte stream by a subsequent `restore_checkpoint` invocation. `prepare_checkpoint` will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

Template Parameters

- **T** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters

- **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. `async`, `sync`, etc.
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns `prepare_checkpoint` returns a properly resized checkpoint object that can be used for a subsequent `restore_checkpoint` operation.

```
template<typename T, typename ...Ts>
hpx::future<checkpoint> prepare_checkpoint(hpx::launch p, checkpoint &&c, T const &t, Ts
const&... ts)
```

```
    prepare_checkpoint
```

`prepare_checkpoint` takes the containers which have to be filled from the byte stream by a subsequent `restore_checkpoint` invocation. `prepare_checkpoint` will calculate the necessary buffer size and will return an appropriately sized checkpoint object.

Template Parameters

- **T** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters

- **p** – Takes an HPX launch policy. Allows the user to change the way the function is launched i.e. async, sync, etc.
- **c** – Takes a pre-initialized checkpoint to prepare
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns `prepare_checkpoint` returns a properly resized checkpoint object that can be used for a subsequent `restore_checkpoint` operation.

```
template<typename T, typename ...Ts>
void restore_checkpoint(checkpoint const &c, T &t, Ts&... ts)
```

Restore_checkpoint

`Restore_checkpoint` takes a checkpoint object as a first argument and the containers which will be filled from the byte stream (in the same order as they were placed in `save_checkpoint`). `Restore_checkpoint` can resurrect a stored component in two ways: by passing in a instance of a component's `shared_ptr` or by passing in an instance of the component's client.

Template Parameters

- **T** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters

- **c** – The checkpoint to restore.
- **t** – A container to restore.
- **ts** – Other containers to restore Containers must be in the same order that they were inserted into the checkpoint.

Returns `Restore_checkpoint` returns void.

```
class checkpoint
#include <checkpoint.hpp> Checkpoint Object
```

Checkpoint is the container object which is produced by `save_checkpoint` and is consumed by a `restore_checkpoint`. A checkpoint may be moved into the `save_checkpoint` object to write the byte stream to the pre-created checkpoint object.

Checkpoints are able to store all containers which are able to be serialized including components.

Public Types

```
using const_iterator = std::vector<char>::const_iterator
```

Public Functions

```
checkpoint() = default  
~checkpoint() = default  
checkpoint(checkpoint const &c) = default  
checkpoint(checkpoint &&c) noexcept = default  
inline checkpoint(std::vector<char> const &vec)  
inline checkpoint(std::vector<char> &&vec) noexcept  
checkpoint &operator=(checkpoint const &c) = default  
checkpoint &operator=(checkpoint &&c) noexcept = default  
inline const_iterator begin() const noexcept  
inline const_iterator end() const noexcept  
inline std::size_t size() const noexcept  
inline char *data() noexcept  
inline char const *data() const noexcept
```

Private Functions

```
template<typename Archive>  
inline void serialize(Archive &arch, const unsigned int)
```

Private Members

```
std::vector<char> data_
```

Friends

```
friend class hpx::serialization::access  
friend std::ostream &operator<<(std::ostream &ost, checkpoint const &ckp)  
    Operator<< Overload
```

This overload is the main way to write data from a checkpoint to an object such as a file. Inside the function, the size of the checkpoint will be written to the stream before the checkpoint's data. The operator>> overload uses this to read the correct number of bytes. Be mindful of this additional write and read when you use different facilities to write out or read in data to a checkpoint!

Parameters

- **ost** – Output stream to write to.
- **ckp** – Checkpoint to copy from.

Returns Operator<< returns the ostream object.

```
friend std::istream &operator>>(std::istream &ist, checkpoint &ckp)
```

Operator>> Overload

This overload is the main way to read in data from an object such as a file to a checkpoint. It is important to note that inside the function, the first variable to be read is the size of the checkpoint. This size variable is written to the stream before the checkpoint's data in the operator<< overload. Be mindful of this additional read and write when you use different facilities to read in or write out data from a checkpoint!

Parameters

- **ist** – Input stream to write from.
- **ckp** – Checkpoint to write to.

Returns Operator>> returns the ostream object.

```
template<typename T, typename ...Ts>
```

```
friend void restore_checkpoint(checkpoint const &c, T &t, Ts&... ts)
```

Restore_checkpoint

Restore_checkpoint takes a checkpoint object as a first argument and the containers which will be filled from the byte stream (in the same order as they were placed in save_checkpoint). Restore_checkpoint can resurrect a stored component in two ways: by passing in a instance of a component's shared_ptr or by passing in an instance of the component's client.

Template Parameters

- **T** – A container to restore.
- **Ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Parameters

- **c** – The checkpoint to restore.
- **t** – A container to restore.
- **ts** – Other containers to restore. Containers must be in the same order that they were inserted into the checkpoint.

Returns Restore_checkpoint returns void.

```
inline friend bool operator==(checkpoint const &lhs, checkpoint const &rhs)
```

```
inline friend bool operator!=(checkpoint const &lhs, checkpoint const &rhs)
```

checkpoint_base

namespace **hpx**

 namespace **util**

Functions

```
template<typename Container, typename ...Ts>
void save_checkpoint_data(Container &data, Ts&&... ts)
    save_checkpoint_data
```

Save_checkpoint_data takes any number of objects which a user may wish to store in the given container.

Template Parameters

- **Container** – Container used to store the check-pointed data.
- **Ts** – Types of variables to checkpoint

Parameters

- **data** – Container instance used to store the checkpoint data
- **ts** – Variable instances to be inserted into the checkpoint.

```
template<typename ...Ts>
std::size_t prepare_checkpoint_data(Ts const&... ts)
    prepare_checkpoint_data
```

prepare_checkpoint_data takes any number of objects which a user may wish to store in a subsequent save_checkpoint_data operation. The function will return the number of bytes necessary to store the data that will be produced.

Template Parameters **Ts** – Types of variables to checkpoint

Parameters **ts** – Variable instances to be inserted into the checkpoint.

```
template<typename Container, typename ...Ts>
void restore_checkpoint_data(Container const &cont, Ts&... ts)
    restore_checkpoint_data
```

restore_checkpoint_data takes any number of objects which a user may wish to restore from the given container. The sequence of objects has to correspond to the sequence of objects for the corresponding call to save_checkpoint_data that had used the given container instance.

Template Parameters

- **Container** – Container used to restore the check-pointed data.
- **Ts** – Types of variables to restore

Parameters

- **cont** – Container instance used to restore the checkpoint data
- **ts** – Variable instances to be restored from the container

```
struct checkpointing_tag  
template<>  
struct extra_data_helper<checkpointing_tag>
```

Public Static Functions

```
static extra_data_id_type id() noexcept

Functions

```
template<typename T>  
hpx::future<std::vector<std::decay_t<T>>> all_gather(char const *basename, T &&result,  
                                num_sites_arg num_sites = num_sites_arg(),  
                                this_site_arg this_site = this_site_arg(),  
                                generation_arg generation = generation_arg(),  
                                root_site_arg root_site = root_site_arg())
```

AllGather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the all_gather operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
\params root_site The site that is responsible for creating the all_gather support object. This value is optional and defaults to ‘0’ (zero).

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_gather operation has been completed.

```
template<typename T>
hpx::future<std::vector<decay_t<T>>> all_gather(communicator comm, T &&result,
                                                     this_site_arg this_site = this_site_arg(),
                                                     generation_arg generation =
                                                     generation_arg())
```

AllGather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

AllGather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – The value to transmit to all participating sites from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*

                                             generation_arg(), root_site_arg root_site = root_site_arg())
```

AllToAll a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the all_to_all operation
- **local_result** – A vector of values to transmit to all participating sites from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

- **generation** – The generational counter identifying the sequence number of the all_to_all operation performed on the given base name. This is optional and needs to be supplied only if the all_to_all operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

- **root_site** – The site that is responsible for creating the all_to_all support object. This value is optional and defaults to ‘0’ (zero).

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_to_all operation has been completed.

```
template<typename T>
hpx::future<std::vector<T>> all_to_all(communicator fid, std::vector<T> &&local_result,
                                             this_site_arg this_site = this_site_arg(), generation_arg
                                             generation = generation_arg())
```

AllToAll a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

AllToAll a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **fid** – A communicator object returned from *create_communicator*
- **local_result** – A vector of values to transmit to all participating sites from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_to_all operation performed on the given base name. This is optional and needs to be supplied only if the all_to_all operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **fid** – A communicator object returned from *create_communicator*
- **local_result** – A vector of values to transmit to all participating sites from this call site.
- **generation** – The generational counter identifying the sequence number of the all_to_all operation performed on the given base name. This is optional and needs to be supplied only if the all_to_all operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_to_all operation has been completed.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_to_all operation has been completed.

hpx/collectives/argument_types.hpp

Defined in header `hpx/collectives/argument_types.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

TypeDefs

using **num_sites_arg** = detail::argument_type<detail::num_sites_tag>

The number of participating sites (default: all localities)

using **this_site_arg** = detail::argument_type<detail::this_site_tag>

The local end of the communication channel.

using **that_site_arg** = detail::argument_type<detail::that_site_tag>

The opposite end of the communication channel.

using **generation_arg** = detail::argument_type<detail::generation_tag>

The generational counter identifying the sequence number of the operation performed on the given base name. It needs to be supplied only if the operation on the given base name has to be performed more than once. It must be a positive number greater than zero.

using **root_site_arg** = detail::argument_type<detail::root_site_tag, 0>

The site that is responsible for creating the support object of the operation. It defaults to ‘0’ (zero).

using **tag_arg** = detail::argument_type<detail::tag_tag, 0>

The tag identifying the concrete operation.

using **arity_arg** = detail::argument_type<detail::arity_tag>

The number of children each of the communication nodes is connected to (default: picked based on `num_sites`).

hpx::distributed::barrier

Defined in header `hpx/barrier.hpp`⁷⁹¹.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

⁷⁹¹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/barrier.hpp>

namespace hpx

Top level HPX namespace.

namespace distributed**Functions**

explicit barrier(*std*::string const &base_name)

Creates a barrier, rank is locality id, size is number of localities

A barrier *base_name* is created. It expects that `hpx::get_num_localities()` participate and the local rank is `hpx::get_locality_id()`.

Parameters **base_name** – The name of the barrier

barrier(*std*::string const &base_name, *std*::size_t num)

Creates a barrier with a given size, rank is locality id

A barrier *base_name* is created. It expects that *num* participate and the local rank is `hpx::get_locality_id()`.

Parameters

- **base_name** – The name of the barrier
- **num** – The number of participating threads

barrier(*std*::string const &base_name, *std*::size_t num, *std*::size_t rank)

Creates a barrier with a given size and rank

A barrier *base_name* is created. It expects that *num* participate and the local rank is *rank*.

Parameters

- **base_name** – The name of the barrier
- **num** – The number of participating threads
- **rank** – The rank of the calling site for this invocation

barrier(*std*::string const &base_name, *std*::vector<*std*::size_t> const &ranks, *std*::size_t rank)

Creates a barrier with a vector of ranks

A barrier *base_name* is created. It expects that `ranks.size()` and the local rank is *rank* (must be contained in *ranks*).

Parameters

- **base_name** – The name of the barrier
- **ranks** – Gives a list of participating ranks (this could be derived from a list of locality ids)
- **rank** – The rank of the calling site for this invocation

void wait() const

Wait until each participant entered the barrier. Must be called by all participants

Returns This function returns once all participants have entered the barrier (have called *wait*).

```
hpx::future<void> wait(hpx::launch::async_policy) const
```

Wait until each participant entered the barrier. Must be called by all participants

Returns a future that becomes ready once all participants have entered the barrier (have called *wait*).

```
static void synchronize()
```

Perform a global synchronization using the default global barrier. The barrier is created once at startup and can be reused throughout the lifetime of an HPX application.

Note: This function currently does not support dynamic connection and disconnection of localities.

hpx/collectives/broadcast.hpp

Defined in header hpx/collectives/broadcast.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

```
template<typename T>
hpx::future<T> broadcast_to(char const *basename, T &&local_result, num_sites_arg num_sites =
    num_sites_arg(), this_site_arg this_site = this_site_arg(),
    generation_arg generation = generation_arg())
```

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the broadcast operation
- **local_result** – A value to transmit to all participating sites from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

```
template<typename T>
hpx::future<T> broadcast_to(communicator comm, T &&local_result, this_site_arg this_site =
    this_site_arg(), generation_arg generation = generation_arg())
```

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

Note: The generation values from corresponding *broadcast_to* and *broadcast_from* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – A value to transmit to all participating sites from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

```
template<typename T>
hpx::future<T> broadcast_to(communicator comm, generation_arg generation, T &&local_result,
                             this_site_arg this_site = this_site_arg())
```

Broadcast a value to different call sites

This function sends a set of values to all call sites operating on the given base name.

Note: The generation values from corresponding *broadcast_to* and *broadcast_from* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – A value to transmit to all participating sites from this call site.
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

Returns This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

```
template<typename T>
hpx::future<T> broadcast_from(char const *basename, this_site_arg this_site = this_site_arg(),
                               generation_arg generation = generation_arg())
```

Receive a value that was broadcast to different call sites

This function sends a set of values to all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the broadcast operation
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

Returns This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

```
template<typename T>
```

```
hpx::future<T> broadcast_from(communicator comm, this_site_arg this_site = this_site_arg(),
                                generation_arg generation = generation_arg())
```

Receive a value that was broadcast to different call sites

This function sends a set of values to all call sites operating on the given base name.

Receive a value that was broadcast to different call sites

This function sends a set of values to all call sites operating on the given base name.

Note: The generation values from corresponding *broadcast_to* and *broadcast_from* have to match.

Note: The generation values from corresponding *broadcast_to* and *broadcast_from* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever *hpx::get_locality_id()* returns.
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*
- **generation** – The generational counter identifying the sequence number of the broadcast operation performed on the given base name. This is optional and needs to be supplied only if the broadcast operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever *hpx::get_locality_id()* returns.

Returns This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

Returns This function returns a future holding the value that was sent to all participating sites. It will become ready once the broadcast operation has been completed.

hpx/collectives/broadcast_direct.hpp

Defined in header hpx/collectives/broadcast_direct.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

namespace **lcos**

Functions

```
template<typename Action, typename ArgN, ...
> hpx::future< std::vector< decltype(Action(hpx::id_type, ArgN,...,
)>> > broadcast (std::vector< hpx::id_type > const &ids, ArgN argN,...)
```

Perform a distributed broadcast operation.

The function `hpx::lcos::broadcast` performs a distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The given action is invoked asynchronously on all given identifiers, and the arguments `ArgN` are passed along to those invocations.

Note: If `decltype(Action(...))` is void, then the result of this function is `future<void>`.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall reduction operation.

```
template<typename Action, typename ArgN, ...
> void broadcast_post (std::vector< hpx::id_type > const &ids, ArgN argN,...)
```

Perform an asynchronous (fire&forget) distributed broadcast operation.

The function `hpx::lcos::broadcast_post` performs an asynchronous (fire&forget) distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The given action is invoked asynchronously on all given identifiers, and the arguments `ArgN` are passed along to those invocations.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

```
template<typename Action, typename ArgN, ...
> hpx::future< std::vector< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))>> > broadcast_with_index (std::vector< hpx::id_type > const &ids,
ArgN argN,...)
```

Perform a distributed broadcast operation.

The function `hpx::lcos::broadcast_with_index` performs a distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

Note: If `decltype(Action(...))` is void, then the result of this function is `future<void>`.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall reduction operation.

```
template<typename Action, typename ArgN, ...>
void broadcast_post_with_index (std::vector< hpx::id_type > const &ids,
ArgN argN,...)
```

Perform an asynchronous (fire&forget) distributed broadcast operation.

The function `hpx::lcos::broadcast_post_with_index` performs an asynchronous (fire&forget) distributed broadcast operation resulting in action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The given action is invoked asynchronously on all given identifiers, and the arguments ArgN are passed along to those invocations.

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

hpx/collectives/channel_communicator.hpp

Defined in header `hpx/collectives/channel_communicator.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

```
hpx::future<channel_communicator> create_channel_communicator(char const *basename,
                                                               num_sites_arg num_sites =
                                                               num_sites_arg(), this_site_arg
                                                               this_site = this_site_arg())
```

Create a new communicator object usable with peer-to-peer channel-based operations

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of channel-based peer-to-peer operations.

Parameters

- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future to a new communicator object usable with the collective operation.

```
channel_communicator create_channel_communicator(hpx::launch::sync_policy, char const
                                                 *basename, num_sites_arg num_sites =
                                                 num_sites_arg(), this_site_arg this_site =
                                                 this_site_arg())
```

Create a new communicator object usable with peer-to-peer channel-based operations

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of channel-based peer-to-peer operations.

Parameters

- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a new communicator object usable with the collective operation.

```
template<typename T>
hpx::future<void> set(channel_communicator comm, that_site_arg site, T &&value, tag_arg tag =
tag_arg())
```

Send a value to the given site

This function sends a value to the given site based on the given communicator.

Parameters

- **comm** – The channel communicator object to use for the data transfer
- **site** – The destination site
- **value** – The value to send
- **tag** – The (optional) tag identifying the concrete operation

Returns This function returns a future<void> that becomes ready once the data transfer operation has finished.

```
template<typename T>
hpx::future<T> get(channel_communicator comm, that_site_arg site, tag_arg tag = tag_arg())
```

Send a value to the given site

This function receives a value from the given site based on the given communicator.

Parameters

- **comm** – The channel communicator object to use for the data transfer
- **site** – The source site

Returns This function returns a future<T> that becomes ready once the data transfer operation has finished. The future will hold the received value.

class **channel_communicator**

#include <channel_communicator.hpp> A handle identifying the communication channel to use for get/set operations

hpx/collectives/communication_set.hpp

Defined in header hpx/collectives/communication_set.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

```
communicator create_communication_set(char const *basename, num_sites_arg num_sites =
                                         num_sites_arg(), this_site_arg this_site = this_site_arg(),
                                         generation_arg generation = generation_arg(), arity_arg
                                         arity = arity_arg())
```

The function *create_communication_set* sets up a (distributed) tree-like communication structure that can be used with any of the collective APIs (such like *all_to_all* and similar).

Parameters

- **basename** – The base name identifying the all_to_all operation
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
- **arity** – The number of children each of the communication nodes is connected to (default: picked based on num_sites).

Returns This function returns a new communicator object usable with the collective operation.

hpx/collectives/create_communicator.hpp

Defined in header `hpx/collectives/create_communicator.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

```
communicator create_communicator(char const *basename, num_sites_arg num_sites =
    num_sites_arg(), this_site_arg this_site = this_site_arg(),
    generation_arg generation = generation_arg(), root_site_arg
    root_site = root_site_arg())
```

Create a new communicator object usable with any collective operation

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of any of the collective operations (such as *all_gather*, *all_reduce*, *all_to_all*, *broadcast*, etc.).

Parameters

- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
- **root_site** – The site that is responsible for creating the collective support object. This value is optional and defaults to ‘0’ (zero).

Returns This function returns a new communicator object usable with the collective operation.

```
communicator create_local_communicator(char const *basename, num_sites_arg num_sites,
    this_site_arg this_site, generation_arg generation =
    generation_arg(), root_site_arg root_site =
    root_site_arg())
```

Create a new communicator object usable with any local collective operation

This functions creates a new communicator object that can be called in order to pre-allocate a communicator object usable with multiple invocations of any of the collective operations (such as *all_gather*, *all_reduce*, *all_to_all*, *broadcast*, etc.).

Parameters

- **basename** – The base name identifying the collective operation
- **num_sites** – The number of participating sites
- **this_site** – The sequence number of this invocation (usually the sequence number of the object participating in the collective operation). This value must be in the range [0, `num_sites`).

- **generation** – The generational counter identifying the sequence number of the collective operation performed on the given base name. This is optional and needs to be supplied only if the collective operation on the given base name has to be performed more than once.
- **root_site** – The site that is responsible for creating the collective support object. This value is optional and defaults to ‘0’ (zero).

Returns This function returns a new communicator object usable for all local collective operations.

struct **communicator**

#include <create_communicator.hpp> A communicator instance represents the list of sites that participate in a particular collective operation.

Public Functions

void **set_info**(*num_sites_arg* num_sites, *this_site_arg* this_site) noexcept

Store the number of used sites and the index of the current site for this communicator instance.

Parameters

- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this site (usually the locality id).

std::pair<*num_sites_arg*, *this_site_arg*> **get_info**() const noexcept

Retrieve the number of used sites and the index of the current site for this communicator instance.

bool **is_root**() const

Return whether this communicator instance represents the root site of the communication operation.

hpx/collectives/exclusive_scan.hpp

Defined in header hpx/collectives/exclusive_scan.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> exclusive_scan(char const *basename, T &&result, F &&op,
                                                num_sites_arg num_sites = num_sites_arg(),
                                                this_site_arg this_site = this_site_arg(),
                                                generation_arg generation = generation_arg(),
                                                root_site_arg root_site = root_site_arg())
```

Exclusive scan a set of values from different call sites

This function performs an exclusive scan operation on a set of values received from all call sites operating on the given base name.

Note: The result returned on the root_site is always the same as the result returned on thus_site == 1 and is the same as the value provided by the root_site.

Parameters

- **basename** – The base name identifying the exclusive_scan operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the exclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the exclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero. \params root_site The site that is responsible for creating the exclusive_scan support object. This value is optional and defaults to '0' (zero).

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the exclusive_scan operation has been completed.

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> exclusive_scan(communicator comm, T &&result, F &&op,
                                                 this_site_arg this_site = this_site_arg(),
                                                 generation_arg generation = generation_arg())
```

Exclusive scan a set of values from different call sites

This function performs an exclusive scan operation on a set of values received from all call sites operating on the given base name.

Exclusive scan a set of values from different call sites

This function performs an exclusive scan operation on a set of values received from all call sites operating on the given base name.

Note: The result returned on the root_site is always the same as the result returned on thus_site == 1 and is the same as the value provided by the root_site.

Note: The result returned on the root_site is always the same as the result returned on thus_site == 1 and is the same as the value provided by the root_site.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the exclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the exclusive_scan operation on the given base name has to be performed

more than once. The generation number (if given) must be a positive number greater than zero.

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **generation** – The generational counter identifying the sequence number of the exclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the exclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the exclusive_scan operation has been completed.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the exclusive_scan operation has been completed.

hpx/collectives/fold.hpp

Defined in header hpx/collectives/fold.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

namespace **lcos**

Functions

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN, ...
))> fold (std::vector< hpx::id_type > const &ids, FoldOp &&fold_op, Init &&init,
ArgN argN, ...)
```

Perform a distributed fold operation.

The function hpx::lcos::fold performs a distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

Note: The type of the initial value must be convertible to the result type returned from the invoked action.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.

- **init** – [in] The initial value to be used for the folding operation
- **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall folding operation.

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))> fold_with_index (std::vector< hpx::id_type > const &ids,
FoldOp &&fold_op, Init &&init, ArgN argN,...)
```

Perform a distributed folding operation.

The function `hpx::lcos::fold_with_index` performs a distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

Note: The type of the initial value must be convertible to the result type returned from the invoked action.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
- **init** – [in] The initial value to be used for the folding operation
- **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall folding operation.

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...
> hpx::future< decltype(Action(hpx::id_type, ArgN,...,
))> inverse_fold (std::vector< hpx::id_type > const &ids, FoldOp &&fold_op,
Init &&init, ArgN argN,...)
```

Perform a distributed inverse folding operation.

The function `hpx::lcos::inverse_fold` performs an inverse distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

Note: The type of the initial value must be convertible to the result type returned from the invoked action.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.

- **init** – [in] The initial value to be used for the folding operation
- **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall folding operation.

```
template<typename Action, typename FoldOp, typename Init, typename ArgN, ...>
> hpx::future< decltype(Action(hpx::id_type, ArgN,...,
std::size_t))> inverse_fold_with_index (std::vector< hpx::id_type > const &ids,
FoldOp &&fold_op, Init &&init, ArgN argN,...)
```

Perform a distributed inverse folding operation.

The function `hpx::lcos::inverse_fold_with_index` performs an inverse distributed folding operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

Note: The type of the initial value must be convertible to the result type returned from the invoked action.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **fold_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the folding operation performed on its arguments.
- **init** – [in] The initial value to be used for the folding operation
- **argN** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall folding operation.

hpx/collectives/gather.hpp

Defined in header `hpx/collectives/gather.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

```
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_here(char const *basename, T &&result,
                                                       num_sites_arg num_sites = num_sites_arg(),
                                                       this_site_arg this_site = this_site_arg(),
                                                       generation_arg generation = generation_arg())
```

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the gather operation
- **result** – The value to transmit to the central gather point from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

```
template<typename T>
hpx::future<std::vector<decay_t<T>>> gather_here(communicator comm, T &&result, this_site_arg
                                                       this_site = this_site_arg(), generation_arg
                                                       generation = generation_arg())
```

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Gather a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Note: The generation values from corresponding *gather_here* and *gather_there* have to match.

Note: The generation values from corresponding *gather_here* and *gather_there* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **result** – The value to transmit to the central gather point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*
- **result** – The value to transmit to the central gather point from this call site.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied

only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

```
template<typename T>
hpx::future<void> gather_there(char const *basename, T &&local_result, this_site_arg this_site =
    this_site_arg(), generation_arg generation = generation_arg(),
    root_site_arg root_site = root_site_arg())
```

Gather a given value at the given call site

This function transmits the value given by *result* to a central gather site (where the corresponding *gather_here* is executed)

Parameters

- **basename** – The base name identifying the gather operation
- **local_result** – The value to transmit to the central gather point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **root_site** – The sequence number of the central gather point (usually the locality id). This value is optional and defaults to 0.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

```
template<typename T>
hpx::future<void> gather_there(communicator fid, T &&local_result, this_site_arg this_site =
    this_site_arg(), generation_arg generation = generation_arg())
```

Gather a given value at the given call site

This function transmits the value given by *result* to a central gather site (where the corresponding *gather_here* is executed)

Gather a given value at the given call site

This function transmits the value given by *result* to a central gather site (where the corresponding *gather_here* is executed)

Note: The generation values from corresponding *gather_here* and *gather_there* have to match.

Note: The generation values from corresponding *gather_here* and *gather_there* have to match.

Parameters

- **fid** – A communicator object returned from *create_communicator*
- **local_result** – The value to transmit to the central gather point from this call site.

- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **fid** – A communicator object returned from *create_communicator*
- **local_result** – The value to transmit to the central gather point from this call site.
- **generation** – The generational counter identifying the sequence number of the gather operation performed on the given base name. This is optional and needs to be supplied only if the gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

Returns This function returns a future holding a vector with all gathered values. It will become ready once the gather operation has been completed.

hpx/collectives/inclusive_scan.hpp

Defined in header hpx/collectives/inclusive_scan.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> inclusive_scan(char const *basename, T &&result, F &&op,
                                                num_sites_arg num_sites = num_sites_arg(),
                                                this_site_arg this_site = this_site_arg(),
                                                generation_arg generation = generation_arg(),
                                                root_site_arg root_site = root_site_arg())
```

Inclusive inclusive_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the inclusive_scan operation
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the inclusive_scan operation performed on the given base name. This is optional and needs to be

supplied only if the inclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero. \params root_site The site that is responsible for creating the inclusive_scan support object. This value is optional and defaults to ‘0’ (zero).

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the inclusive_scan operation has been completed.

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> inclusive_scan(communicator comm, T &&result, F &&op,
                                                 this_site_arg this_site = this_site_arg(),
                                                 generation_arg generation = generation_arg())
```

Inclusive inclusive_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

Inclusive inclusive_scan a set of values from different call sites

This function performs an inclusive scan operation on a set of values received from all call sites operating on the given base name.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – The value to transmit to all participating sites from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the inclusive_scan operation performed on the given base name. This is optional and needs to be supplied only if the inclusive_scan operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the inclusive_scan operation has been completed.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the inclusive_scan operation has been completed.

hpx::distributed::latch

Defined in header `hpx/latch.hpp`⁷⁹².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace hpx

Top level HPX namespace.

namespace distributed

```
class latch : public components::client_base<latch, hpx::lcos::server::latch>
#include <latch.hpp> Latch is an implementation of a synchronization primitive that allows multiple
threads to wait for a shared event to occur before proceeding. This latch can be invoked in a distributed
application.
```

For a local only latch

See also:

`hpx::latch`.

Public Functions

latch() = default

explicit latch(`std::ptrdiff_t` count)

Initialize the latch

Requires: `count >= 0`. Synchronization: None Postconditions: `counter_ == count`.

inline latch(`hpx::id_type` const &`id`)

Extension: Create a client side representation for the existing `server::latch` instance with the given global id `id`.

inline latch(`hpx::future<hpx::id_type>` &&`f`)

Extension: Create a client side representation for the existing `server::latch` instance with the given global id `id`.

inline latch(`hpx::shared_future<hpx::id_type>` const &`id`)

Extension: Create a client side representation for the existing `server::latch` instance with the given global id `id`.

inline latch(`hpx::shared_future<hpx::id_type>` &&`id`)

inline void count_down_and_wait()

Decrements `counter_` by 1 . Blocks at the synchronization point until `counter_` reaches 0.

Requires: `counter_ > 0`.

Synchronization: Synchronizes with all calls that block on this latch and with all `is_ready` calls on this latch that return true.

Throws Nothing. –

⁷⁹² <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/latch.hpp>

```
inline void arrive_and_wait()  
    Decrements counter_ by update . Blocks at the synchronization point until counter_ reaches 0.  
    Requires: counter_ > 0.  
    Synchronization: Synchronizes with all calls that block on this latch and with all is_ready calls on  
    this latch that return true.  
    Throws Nothing. –  
  
inline void count_down(std::ptrdiff_t n)  
    Decrements counter_ by n. Does not block.  
    Requires: counter_ >= n and n >= 0.  
    Synchronization: Synchronizes with all calls that block on this latch and with all is_ready calls on  
    this latch that return true .  
    Throws Nothing. –  
  
inline bool is_ready() const noexcept  
    Returns: counter_ == 0. Does not block.  
    Throws Nothing. –  
  
inline bool try_wait() const noexcept  
    Returns: counter_ == 0. Does not block.  
    Throws Nothing. –  
  
inline void wait() const  
    If counter_ is 0, returns immediately. Otherwise, blocks the calling thread at the synchronization  
    point until counter_ reaches 0.  
    Throws Nothing. –
```

Private Types

```
typedef components::client_base<latch, hpx::lcos::server::latch> base_type
```

```
namespace lcos
```

hpx/collectives/reduce.hpp

Defined in header hpx/collectives/reduce.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

Top level HPX namespace.

```
namespace collectives
```

Top level HPX namespace.

Functions

```
template<typename T, typename F>
hpx::future<std::decay_t<T>> reduce_here(char const *basename, T &&result, F &&op,
                                              num_sites_arg num_sites = num_sites_arg(), this_site_arg
                                              this_site = this_site_arg(), generation_arg generation =
                                              generation_arg())
```

Reduce a set of values from different call sites

This function receives a set of values from all call sites operating on the given base name.

Parameters

- **basename** – The base name identifying the all_reduce operation
- **local_result** – A value to reduce on the central reduction point from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.

Returns This function returns a future holding a vector with all values send by all participating sites. It will become ready once the all_reduce operation has been completed.

```
template<typename T, typename F>
hpx::future<decay_t<T>> reduce_here(communicator comm, T &&local_result, F &&op,
                                             this_site_arg this_site = this_site_arg(), generation_arg
                                             generation = generation_arg())
```

Reduce a set of values from different call sites

This function receives a set of values that are the result of applying a given operator on values supplied from all call sites operating on the given base name.

Reduce a set of values from different call sites

This function receives a set of values that are the result of applying a given operator on values supplied from all call sites operating on the given base name.

Note: The generation values from corresponding *reduce_here* and *reduce_there* have to match.

Note: The generation values from corresponding *reduce_here* and *reduce_there* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – A value to reduce on the root_site from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed

more than once. The generation number (if given) must be a positive number greater than zero.

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – A value to reduce on the root_site from this call site.
- **op** – Reduction operation to apply to all values supplied from all participating sites
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

Returns This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

```
template<typename T, typename F>
hpx::future<void> reduce_there(char const *basename, T &&result, this_site_arg this_site =
    this_site_arg(), generation_arg generation = generation_arg(),
    root_site_arg root_site = root_site_arg())
```

Reduce a given value at the given call site

This function transmits the value given by *result* to a central reduce site (where the corresponding *reduce_here* is executed)

Parameters

- **basename** – The base name identifying the reduction operation
- **result** – A future referring to the value to transmit to the central reduction point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **root_site** – The sequence number of the central reduction point (usually the locality id). This value is optional and defaults to 0.

Returns This function returns a future<void>. It will become ready once the reduction operation has been completed.

```
template<typename T>
hpx::future<void> reduce_there(communicator comm, T &&local_result, this_site_arg this_site =
    this_site_arg(), generation_arg generation = generation_arg())
```

Reduce a given value at the given call site

This function transmits the value given by *result* to a central reduce site (where the corresponding *reduce_here* is executed)

Reduce a given value at the given call site

This function transmits the value given by *result* to a central reduce site (where the corresponding *reduce_here* is executed)

Note: The generation values from corresponding *reduce_here* and *reduce_there* have to match.

Note: The generation values from corresponding *reduce_here* and *reduce_there* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **local_result** – A value to reduce on the central reduction point from this call site.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*
- **local_result** – A value to reduce on the central reduction point from this call site.
- **generation** – The generational counter identifying the sequence number of the all_reduce operation performed on the given base name. This is optional and needs to be supplied only if the all_reduce operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

Returns This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

Returns This function returns a future holding a value calculated based on the values send by all participating sites. It will become ready once the all_reduce operation has been completed.

hpx/collectives/reduce_direct.hpp

Defined in header `hpx/collectives/reduce_direct.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

namespace **lcos**

Functions

```
template<typename Action, typename ReduceOp, typename ArgN, ...>
> hpx::future< decltype(Action(hpx::id_type, ArgN,...))> reduce (std::vector< hpx::id_type > const &ids, ReduceOp &&reduce_op, ArgN argN,...)
```

Perform a distributed reduction operation.

The function `hpx::lcos::reduce` performs a distributed reduction operation over results returned from action invocations on a given set of global identifiers. The action can be either a plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **reduce_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the reduction operation performed on its arguments.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall reduction operation.

```
template<typename Action, typename ReduceOp, typename ArgN, ...>
> hpx::future< decltype(Action(hpx::id_type, ArgN,..., std::size_t))> reduce_with_index (std::vector< hpx::id_type > const &ids, ReduceOp &&reduce_op, ArgN argN,...)
```

Perform a distributed reduction operation.

The function `hpx::lcos::reduce_with_index` performs a distributed reduction operation over results returned from action invocations on a given set of global identifiers. The action can be either plain action (in which case the global identifiers have to refer to localities) or a component action (in which case the global identifiers have to refer to instances of a component type which exposes the action).

The function passes the index of the global identifier in the given list of identifiers as the last argument to the action.

Parameters

- **ids** – [in] A list of global identifiers identifying the target objects for which the given action will be invoked.
- **reduce_op** – [in] A binary function expecting two results as returned from the action invocations. The function (or function object) is expected to return the result of the reduction operation performed on its arguments.
- **argN** – [in] Any number of arbitrary arguments (passed by const reference) which will be forwarded to the action invocation.

Returns This function returns a future representing the result of the overall reduction operation.

hpx/collectives/scatter.hpp

Defined in header hpx/collectives/scatter.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

namespace **collectives**

Top level HPX namespace.

Functions

```
template<typename T>
hpx::future<T> scatter_from(char const *basename, this_site_arg this_site = this_site_arg(),
                           generation_arg generation = generation_arg(), root_site_arg root_site =
                           root_site_arg())
```

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

Parameters

- **basename** – The base name identifying the scatter operation
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **root_site** – The sequence number of the central scatter point (usually the locality id). This value is optional and defaults to 0.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

```
template<typename T>
hpx::future<T> scatter_from(communicator comm, this_site_arg this_site = this_site_arg(),
                           generation_arg generation = generation_arg())
```

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

Scatter (receive) a set of values to different call sites

This function receives an element of a set of values operating on the given base name.

Note: The generation values from corresponding *scatter_to* and *scatter_from* have to match.

Note: The generation values from corresponding *scatter_to* and *scatter_from* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

```
template<typename T>
hpx::future<T> scatter_to(char const *basename, std::vector<T> &&result, num_sites_arg num_sites
    = num_sites_arg(), this_site_arg this_site = this_site_arg(), generation_arg
    generation = generation_arg())
```

Scatter (send) a part of the value set at the given call site

This function transmits the value given by *result* to a central scatter site (where the corresponding *scatter_from* is executed)

Parameters

- **basename** – The base name identifying the scatter operation
- **result** – The value to transmit to the central scatter point from this call site.
- **num_sites** – The number of participating sites (default: all localities).
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever hpx::get_locality_id() returns.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

```
template<typename T>
hpx::future<T> scatter_to(communicator comm, std::vector<T> &&result, this_site_arg this_site =
    this_site_arg(), generation_arg generation = generation_arg())
```

Scatter (send) a part of the value set at the given call site

This function transmits the value given by *result* to a central scatter site (where the corresponding *scatter_from* is executed)

Scatter (send) a part of the value set at the given call site

This function transmits the value given by *result* to a central scatter site (where the corresponding

scatter_from is executed)

Note: The generation values from corresponding *scatter_to* and *scatter_from* have to match.

Note: The generation values from corresponding *scatter_to* and *scatter_from* have to match.

Parameters

- **comm** – A communicator object returned from *create_communicator*
- **num_sites** – The number of participating sites (default: all localities).
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **comm** – A communicator object returned from *create_communicator*
- **num_sites** – The number of participating sites (default: all localities).
- **generation** – The generational counter identifying the sequence number of the all_gather operation performed on the given base name. This is optional and needs to be supplied only if the all_gather operation on the given base name has to be performed more than once. The generation number (if given) must be a positive number greater than zero.
- **this_site** – The sequence number of this invocation (usually the locality id). This value is optional and defaults to whatever `hpx::get_locality_id()` returns.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

Returns This function returns a future holding a the scattered value. It will become ready once the scatter operation has been completed.

components

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/components/basename_registration.hpp

Defined in header hpx/components/basename_registration.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename Client>
std::vector<Client> find_all_from_basename(std::string base_name, std::size_t num_ids)
```

Return all registered clients from all localities from the given base name.

This function locates all ids which were registered with the given base name. It returns a list of futures representing those ids.

Return all registered ids from all localities from the given base name.

This function locates all ids which were registered with the given base name. It returns a list of futures representing those ids.

Note: The futures embedded in the returned client objects will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Note: The futures will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Template Parameters **Client** – The client type to return

Parameters

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **num_ids** – [in] The number of registered ids to expect.
- **base_name** – [in] The base name for which to retrieve the registered ids.
- **num_ids** – [in] The number of registered ids to expect.

Returns A list of futures representing the ids which were registered using the given base name.

Returns A list of futures representing the ids which were registered using the given base name.

```
template<typename Client>
std::vector<Client> find_from_basename(std::string base_name, std::vector<std::size_t> const &ids)
```

Return registered clients from the given base name and sequence numbers.

This function locates the ids which were registered with the given base name and the given sequence numbers. It returns a list of futures representing those ids.

Return registered ids from the given base name and sequence numbers.

This function locates the ids which were registered with the given base name and the given sequence numbers. It returns a list of futures representing those ids.

Note: The futures embedded in the returned client objects will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve

ids from a name, even if the name was already registered.

Note: The futures will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Template Parameters `Client` – The client type to return

Parameters

- `base_name` – [in] The base name for which to retrieve the registered ids.
- `ids` – [in] The sequence numbers of the registered ids.
- `base_name` – [in] The base name for which to retrieve the registered ids.
- `ids` – [in] The sequence numbers of the registered ids.

Returns A list of futures representing the ids which were registered using the given base name and sequence numbers.

Returns A list of futures representing the ids which were registered using the given base name and sequence numbers.

template<typename `Client`>

`Client find_from_basename(std::string base_name, std::size_t sequence_nr)`

Return registered id from the given base name and sequence number.

This function locates the id which was registered with the given base name and the given sequence number. It returns a future representing those id.

This function locates the id which was registered with the given base name and the given sequence number. It returns a future representing those id.

Note: The future embedded in the returned client object will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Note: The future will become ready even if the event (for instance, binding the name to an id) has already happened in the past. This is important in order to reliably retrieve ids from a name, even if the name was already registered.

Template Parameters `Client` – The client type to return

Parameters

- `base_name` – [in] The base name for which to retrieve the registered ids.
- `sequence_nr` – [in] The sequence number of the registered id.
- `base_name` – [in] The base name for which to retrieve the registered ids.
- `sequence_nr` – [in] The sequence number of the registered id.

Returns A representing the id which was registered using the given base name and sequence numbers.

Returns A representing the id which was registered using the given base name and sequence numbers.

```
template<typename Client, typename Stub, typename Data>
hpx::future<bool> register_with_basename(std::string base_name, components::client_base<Client, Stub,
                                            Data> &client, std::size_t sequence_nr)
```

Register the id wrapped in the given client using the given base name.

The function registers the object the given client refers to using the provided base name.

Note: The operation will fail if the given sequence number is not unique.

Template Parameters **Client** – The client type to register

Parameters

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **client** – [in] The client which should be registered using the given base name.
- **sequence_nr** – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system-wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

Returns A future representing the result of the registration operation itself.

```
template<typename Client>
Client unregister_with_basename(std::string base_name, std::size_t sequence_nr =
                                -static_cast<std::size_t>(0))
```

Unregister the given id using the given base name.

Unregister the given base name.

The function unregisters the given ids using the provided base name.

The function unregisters the given ids using the provided base name.

Template Parameters **Client** – The client type to return

Parameters

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **sequence_nr** – [in, optional] The sequential number to use for the un-registration. This number has to be the same as has been used with *register_with_basename* before.
- **base_name** – [in] The base name for which to retrieve the registered ids.
- **sequence_nr** – [in, optional] The sequential number to use for the un-registration. This number has to be the same as has been used with *register_with_basename* before.

Returns A future representing the result of the un-registration operation itself.

Returns A future representing the result of the un-registration operation itself.

hpx/components/basename_registration_fwd.hpp

Defined in header hpx/components/basename_registration_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
hpx::future<bool> register_with_basename(std::string base_name, hpx::id_type const &id, std::size_t sequence_nr = ~static_cast<std::size_t>(0))
```

Register the given id using the given base name.

The function registers the given ids using the provided base name.

Note: The operation will fail if the given sequence number is not unique.

Parameters

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **id** – [in] The id to register using the given base name.
- **sequence_nr** – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system-wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

Returns A future representing the result of the registration operation itself.

```
bool register_with_basename(hpx::launch::sync_policy, std::string base_name, hpx::id_type const &id,  
                           std::size_t sequence_nr = ~static_cast<std::size_t>(0), error_code &ec =  
                           throws)
```

```
hpx::future<bool> register_with_basename(std::string base_name, hpx::future<hpx::id_type> f,  
                                         std::size_t sequence_nr = ~static_cast<std::size_t>(0))
```

Register the id wrapped in the given future using the given base name.

The function registers the object the given future refers to using the provided base name.

Note: The operation will fail if the given sequence number is not unique.

Parameters

- **base_name** – [in] The base name for which to retrieve the registered ids.
- **f** – [in] The future which should be registered using the given base name.
- **sequence_nr** – [in, optional] The sequential number to use for the registration of the id. This number has to be unique system-wide for each registration using the same base name. The default is the current locality identifier. Also, the sequence numbers have to be consecutive starting from zero.

Returns A future representing the result of the registration operation itself.

hpx::components::client

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

```
template<typename Component, typename Data = void>
class client : public hpx::components::client_base<client<Component, void>, Component, void>
#include <client.hpp> The client class is a wrapper that manages a distributed component. It extends
client_base with specific Component and Data types.
```

Template Parameters

- **Component** – The type of the component.
- **Data** – The type of the data associated with the client (default is void).

Public Functions

```
client() = default
inline explicit client(hpx::id_type const &id)
inline explicit client(hpx::id_type &&id)
inline explicit client(future_type const &f) noexcept
inline explicit client(future_type &&f) noexcept
inline client(future<hpx::id_type> &&f) noexcept
inline client(future<client> &&c)
client(client const &rhs) noexcept = default
client(client &&rhs) noexcept = default
~client() = default
inline client &operator=(hpx::id_type const &id)
inline client &operator=(hpx::id_type &&id)
inline client &operator=(future_type const &f) noexcept
inline client &operator=(future_type &&f) noexcept
inline client &operator=(future<hpx::id_type> &&f) noexcept
client &operator=(client const &rhs) noexcept = default
client &operator=(client &&rhs) noexcept = default
```

Private Types

```
using base_type = client_base<client, Component, Data>
```

```
using future_type = typename base_type::future_type
```

hpx::components::client_base

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename Derived>
struct is_client<Derived, std::void_t<typename Derived::is_client_tag>> : public true_type
```

namespace **hpx**

namespace **components**

Functions

```
template<typename Derived, typename Stub, typename Data>
bool operator==(client_base<Derived, Stub, Data> const &lhs, client_base<Derived, Stub, Data>
const &rhs)
```

```
template<typename Derived, typename Stub, typename Data>
bool operator<(client_base<Derived, Stub, Data> const &lhs, client_base<Derived, Stub, Data> const
&rhs)
```

```
template<typename Derived, typename Stub, typename Data>
```

```
class client_base : public detail::make_stub::type<Stub>
```

`#include <client_base.hpp>` This class template serves as a base class for client components, providing common functionality such as managing shared state, ID retrieval, and asynchronous operations.

Template Parameters

- **Derived** – The derived client component type.
- **Stub** – The stub type used for communication.
- **Data** – The extra data type used for additional information.

Public Types

```
using stub_argument_type = Stub
```

```
using server_component_type = typename detail::make_stub<Stub>::server_component_type
```

```
using is_client_tag = void
```

Public Functions

```

hpx::future<std::shared_ptr<Component>> get_ptr(hpx::id_type const &id)
```

Returns a future referring to the pointer to the underlying memory of a component.

The function `hpx::get_ptr` can be used to extract a future referring to the pointer to the underlying memory of a given component.

Note: This function will successfully return the requested result only if the given component is currently located on the calling locality. Otherwise, the function will raise an error.

Note: The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned `shared_ptr` alive.

Parameters `id` – [in] The global id of the component for which the pointer to the underlying memory should be retrieved.

Template Parameters `Component` – The type of the server side component.

Returns This function returns a future representing the pointer to the underlying memory for the component instance with the given `id`.

```
template<typename Derived, typename Stub, typename Data>
```

```
hpx::future<std::shared_ptr<typename components::client_base<Derived, Stub, Data>::server_component_type>> get_ptr(components::client_base<Derived, Stub, Data> &c)
```

Returns a future referring to the pointer to the underlying memory of a component.

The function `hpx::get_ptr` can be used to extract a future referring to the pointer to the underlying memory of a given component.

Note: This function will successfully return the requested result only if the given component is currently located on the calling locality. Otherwise, the function will raise an error.

Note: The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned `shared_ptr` alive.

Parameters `c` – [in] A client side representation of the component for which the pointer to the underlying memory should be retrieved.

Returns This function returns a future representing the pointer to the underlying memory for the component instance with the given `id`.

```
template<typename Component>
```

```
std::shared_ptr<Component> get_ptr(launch::sync_policy p, hpx::id_type const &id, error_code &ec = throws)
```

Returns the pointer to the underlying memory of a component.

The function `hpx::get_ptr_sync` can be used to extract the pointer to the underlying memory of a given component.

Note: This function will successfully return the requested result only if the given component is currently located on the requesting locality. Otherwise, the function will raise an error.

Note: The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned `shared_ptr` alive.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise, it throws an instance of `hpx::exception`.

Parameters

- **p** – [in] The parameter `p` represents a placeholder type to turn make the call synchronous.
- **id** – [in] The global id of the component for which the pointer to the underlying memory should be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Template Parameters Component – The only template parameter has to be the type of the server side component.

Returns This function returns the pointer to the underlying memory for the component instance with the given `id`.

```
template<typename Derived, typename Stub, typename Data>
std::shared_ptr<typename components::client_base<Derived, Stub, Data>::server_component_type> get_ptr(launch::sync_policy
p,
com-
po-
nents::client_bas
Stub,
Data>
const
&c,
er-
ror_code
&ec
=
throws)
```

Returns the pointer to the underlying memory of a component.

The function `hpx::get_ptr_sync` can be used to extract the pointer to the underlying memory of a given component.

Note: This function will successfully return the requested result only if the given component is currently located on the requesting locality. Otherwise, the function will raise an error.

Note: The component instance the returned pointer refers to can not be migrated as long as there is at least one copy of the returned shared_ptr alive.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **p** – [in] The parameter *p* represents a placeholder type to turn make the call synchronous.
- **c** – [in] A client side representation of the component for which the pointer to the underlying memory should be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function returns the pointer to the underlying memory for the component instance with the given *id*.

HPX_REGISTER_COMMANDLINE_MODULE

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

Defines

`HPX_DEFINE_COMPONENT_COMMANDLINE_OPTIONS(add_options_function)`

`HPX_REGISTER_COMMANDLINE_MODULE(add_options_function)`

Macro to register a command-line module with the HPX runtime.

This macro facilitates the registration of a command-line module with the HPX runtime system. A command-line module typically provides additional command-line options that can be used to configure the HPX application.

Parameters

- `add_options_function` – The function that adds custom command-line options.

`HPX_REGISTER_COMMANDLINE_MODULE_DYNAMIC(add_options_function)`

namespace `hpx`

namespace `components`

struct `component_commandline` : public `component_commandline_base`

`#include <component_commandline.hpp>` The `component_startup_shutdown` provides a minimal implementation of a component's startup/shutdown function provider.

Public Functions

inline `hpx::program_options::options_description add_commandline_options()` override

Return any additional command line options valid for this component.

Note: This function will be executed by the runtime system during system startup.

Returns The module is expected to fill a `options_description` object with any additional command line options this component will handle.

namespace `commandline_options_provider`

Functions

`hpx::program_options::options_description add_commandline_options()`

HPX_REGISTER_STARTUP_MODULE

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

Defines

`HPX_DEFINE_COMPONENT_STARTUP_SHUTDOWN(startup_, shutdown_)`

`HPX_REGISTER_STARTUP_SHUTDOWN_MODULE_(startup, shutdown)`

`HPX_REGISTER_STARTUP_SHUTDOWN_MODULE_(startup, shutdown)`

`HPX_REGISTER_STARTUP_SHUTDOWN_MODULE_DYNAMIC(startup, shutdown)`

`HPX_REGISTER_STARTUP_MODULE(startup)`

Macro to register a startup module with the HPX runtime.

This macro facilitates the registration of a startup module with the HPX runtime system. A startup module typically contains initialization code that should be executed when the HPX runtime starts.

Parameters

- `startup` – The name of the startup function to be registered.

`HPX_REGISTER_STARTUP_MODULE_DYNAMIC(startup)`

`HPX_REGISTER_SHUTDOWN_MODULE(shutdown)`

`HPX_REGISTER_SHUTDOWN_MODULE_DYNAMIC(shutdown)`

namespace `hpx`

namespace `components`

```
template<bool (*Startup)(startup_function_type&, bool&), bool
(*Shutdown)(shutdown_function_type&, bool&) >
struct component_startup_shutdown : public component_startup_shutdown_base
```

`#include <component_startup_shutdown.hpp>` The `component_startup_shutdown` class provides a minimal implementation of a component's startup/shutdown function provider.

Public Functions

inline bool **get_startup_function**(*startup_function_type* &startup, bool &pre_startup) override
Return any startup function for this component.

Parameters

- **startup** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre_startup** –

Returns Returns *true* if the parameter *startup* has been successfully initialized with the startup function.

inline bool **get_shutdown_function**(*shutdown_function_type* &shutdown, bool &pre_shutdown) override

Return any shutdown function for this component.

Parameters

- **shutdown** – [in, out] The module is expected to fill this function object with a reference to a shutdown function. This function will be executed by the runtime system during system shutdown.
- **pre_shutdown** –

Returns Returns *true* if the parameter *shutdown* has been successfully initialized with the shutdown function.

enumerator **check**

Functions

`constexpr naming::component_type to_int(component_enum_type t) noexcept`

`constexpr int to_int(factory_state t) noexcept`

`bool &enabled(component_type type)`

`util::atomic_count &instance_count(component_type type)`

`component_deleter_type &deleter(component_type type)`

`bool enumerate_instance_counts(hpx::move_only_function<bool(component_type)> const &f)`

`std::string get_component_type_name(component_type type)`

Return the string representation for a given component type id.

`constexpr component_type get_base_type(component_type t) noexcept`

The lower short word of the component type is the type of the component exposing the actions.

`constexpr component_type get_derived_type(component_type t) noexcept`

The upper short word of the component is the actual component type.

`constexpr component_type derived_component_type(component_type derived, component_type base) noexcept`

A component derived from a base component exposing the actions needs to have a specially formatted component type.

`constexpr bool types_are_compatible(component_type lhs, component_type rhs) noexcept`

Verify the two given component types are matching (compatible)

`template<typename Component, typename Enable = void>`
`char const *get_component_name() noexcept`

hpx::components::component, hpx::components::component_base

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

namespace **components**

Typedefs

```
using instead = abstract_component_base<Component>

template<typename Component = void>
class abstract_component_base

template<typename Component, typename Derived = void>
class abstract_managed_component_base

template<typename Component>
class component

#include <components_base_fwd.hpp> The component class wraps around a given component type, adding additional type aliases and constructors. It inherits from the specified component type.

template<typename Component = void>
class component_base

#include <components_base_fwd.hpp> component_base serves as a base class for components. It provides common functionality needed by components, such as address and ID retrieval. The template parameter Component specifies the derived component type.

template<typename Component>
class fixed_component

template<typename Component>
class fixed_component_base

template<typename Component, typename Derived>
class managed_component

#include <managed_component_base.hpp> The managed_component template is used as an indirection layer for components allowing to gracefully handle the access to non-existing components.
```

Additionally, it provides memory management capabilities for the wrapping instances, and it integrates the memory management with the AGAS service. Every instance of a *managed_component* gets assigned a global id. The provided memory management allocates the *managed_component* instances from a special heap, ensuring fast allocation and avoids a full network round trip to the AGAS service for each of the allocated instances.

Template Parameters

- **Component** – Component type
- **Derived** – Most derived component type

```
template<typename Component, typename Wrapper, typename CtorPolicy, typename DtorPolicy>
class managed_component_base
```

hpx/components_base/get_lva.hpp

Defined in header hpx/components_base/get_lva.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

```
template<typename Component, typename Enable = void>
```

```
struct get_lva
```

```
#include <get_lva.hpp> The get_lva template is a helper structure allowing to convert a local virtual address as stored in a local address (returned from the function resolver_client::resolve) to the address of the component implementing the action.
```

The default implementation uses the template argument *Component* to deduce the type wrapping the component implementing the action. This is used to get the needed address.

Template Parameters **Component** – This is the type of the component implementing the action to execute.

hpx/distribution_policies/binpacking_distribution_policy.hpp

Defined in header hpx/distribution_policies/binpacking_distribution_policy.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **components**

Variables

```
constexpr char const *const default_binpacking_counter_name =
"/runtime{locality/total}/count/component@"
```

```
static const binpacking_distribution_policy binpacked = {}
```

A predefined instance of the binpacking *distribution_policy*. It will represent the local locality and will place all items to create here.

```
struct binpacking_distribution_policy
```

#include <binpacking_distribution_policy.hpp> This class specifies the parameters for a binpacking distribution policy to use for creating a given number of items on a given set of localities. The binpacking policy will distribute the new objects in a way such that each of the localities will equalize the number of overall objects of this type based on a given criteria (by default this criteria is the overall number of objects of this type).

Public Functions

```
inline binpacking_distribution_policy()
```

Default-construct a new instance of a *binpacking_distribution_policy*. This policy will represent one locality (the local locality).

```
inline binpacking_distribution_policy operator() (std::vector<id_type> const &locs, char const
                                                 *perf_counter_name =
                                                 default_binpacking_counter_name) const
```

Create a new *default_distribution* policy representing the given set of localities.

Parameters

- **locs** – [in] The list of localities the new instance should represent
- **perf_counter_name** – [in] The name of the performance counter which should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

```
inline binpacking_distribution_policy operator() (std::vector<id_type> &&locs, char const
                                                 *perf_counter_name =
                                                 default_binpacking_counter_name) const
```

Create a new *default_distribution* policy representing the given set of localities.

Parameters

- **locs** – [in] The list of localities the new instance should represent
- **perf_counter_name** – [in] The name of the performance counter which should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

```
inline binpacking_distribution_policy operator() (id_type const &loc, char const
                                                 *perf_counter_name =
                                                 default_binpacking_counter_name) const
```

Create a new *default_distribution* policy representing the given locality

Parameters

- **loc** – [in] The locality the new instance should represent
- **perf_counter_name** – [in] The name of the performance counter that should be used as the distribution criteria (by default the overall number of existing instances of the given component type will be used).

```
template<typename Component, typename ...Ts>
inline hpx::future<hpx::id_type> create(Ts&&... vs) const
    Create one object on one of the localities associated by this policy instance
    Parameters vs – [in] The arguments which will be forwarded to the constructor of the new
        object.
    Returns A future holding the global address which represents the newly created object

template<bool WithCount, typename Component, typename ...Ts>
inline hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs)
    const
    Create multiple objects on the localities associated by this policy instance
    Parameters
        • count – [in] The number of objects to create
        • vs – [in] The arguments which will be forwarded to the constructors of the new objects.
    Returns A future holding the list of global addresses which represent the newly created
        objects

inline std::string const &get_counter_name() const
    Returns the name of the performance counter associated with this policy instance.

inline std::size_t get_num_localities() const
    Returns the number of associated localities for this distribution policy
```

Note: This function is part of the creation policy implemented by this class

hpx/distribution_policies/colocating_distribution_policy.hpp

Defined in header hpx/distribution_policies/colocating_distribution_policy.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **components**

Variables

```
static const colocating_distribution_policy colocated = {}
```

A predefined instance of the co-locating *distribution_policy*. It will represent the local locality and will place all items to create here.

```
struct colocating_distribution_policy
```

```
#include <colocating_distribution_policy.hpp> This class specifies the parameters for a distribution
policy to use for creating a given number of items on the locality where a given object is currently
placed.
```

Public Functions

```
constexpr colocating_distribution_policy() = default
```

Default-construct a new instance of a `colocating_distribution_policy`. This policy will represent the local locality.

```
inline colocating_distribution_policy operator()(id_type const &id) const
```

Create a new `colocating_distribution_policy` representing the locality where the given object is current located

Parameters **id** – [in] The global address of the object with which the new instances should be colocated on

```
template<typename Client, typename Stub, typename Data>
```

```
inline colocating_distribution_policy operator()(client_base<Client, Stub, Data> const &client) const
```

Create a new `colocating_distribution_policy` representing the locality where the given object is current located

Parameters **client** – [in] The client side representation of the object with which the new instances should be colocated on

```
template<typename Component, typename ...Ts>
```

```
inline hpx::future<hpx::id_type> create(Ts&&... vs) const
```

Create one object on the locality of the object this distribution policy instance is associated with

Note: This function is part of the placement policy implemented by this class

Parameters **vs** – [in] The arguments which will be forwarded to the constructor of the new object.

Returns A future holding the global address which represents the newly created object

```
template<bool WithCount, typename Component, typename ...Ts>
```

```
inline hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs) const
```

Create multiple objects colocated with the object represented by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters

- **count** – [in] The number of objects to create
- **vs** – [in] The arguments which will be forwarded to the constructors of the new objects.

Returns A future holding the list of global addresses which represent the newly created objects

```
template<typename Action, typename ...Ts>
```

```
inline async_result<Action>::type async(launch policy, Ts&&... vs) const
```

```
template<typename Action, typename Callback, typename ...Ts>
```

```
inline async_result<Action>::type async_cb(launch policy, Callback &&cb, Ts&&... vs) const
```

Note: This function is part of the invocation policy implemented by this class

```

hpx::traits::extract_action<Action>::remote_result_type>::type>
```

`hpx/distribution_policies/default_distribution_policy.hpp`

Defined in header `hpx/distribution_policies/default_distribution_policy.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **components**

Variables

```
static const default_distribution_policy default_layout = {}
```

A predefined instance of the default *distribution_policy*. It will represent the local locality and will place all items to create here.

struct **default_distribution_policy**

```
#include <default_distribution_policy.hpp>
```

This class specifies the parameters for a simple distribution policy to use for creating (and evenly distributing) a given number of items on a given set of localities.

Public Functions

```
constexpr default_distribution_policy() = default
```

Default-construct a new instance of a *default_distribution_policy*. This policy will represent one locality (the local locality).

```
inline default_distribution_policy operator()(std::vector<id_type> locs) const
```

Create a new *default_distribution* policy representing the given set of localities.

Parameters *locs* – [in] The list of localities the new instance should represent

```
inline default_distribution_policy operator()(id_type loc) const
```

Create a new *default_distribution* policy representing the given locality

Parameters *loc* – [in] The locality the new instance should represent

```
template<typename Component, typename ...Ts>
```

```
inline hpx::future<hpx::id_type> create(Ts&&... vs) const
```

Create one object on one of the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters *vs* – [in] The arguments which will be forwarded to the constructor of the new object.

Returns A future holding the global address which represents the newly created object

```
template<bool WithCount, typename Component, typename ...Ts>
```

```
inline hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs) const
```

Create multiple objects on the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters

- **count** – [in] The number of objects to create
- **vs** – [in] The arguments which will be forwarded to the constructors of the new objects.

Returns A future holding the list of global addresses that represent the newly created objects

```
template<typename Action, typename ...Ts>
inline async_result<Action>::type async(launch policy, Ts&&... vs) const
```

```

    hpx::traits::extract_action<Action>::remote_result_type>::type>
```

`hpx/distribution_policies/target_distribution_policy.hpp`

Defined in header `hpx/distribution_policies/target_distribution_policy.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **components**

Variables

```
static const target_distribution_policy target = {}
```

A predefined instance of the `target_distribution_policy`. It will represent the local locality and will place all items to create here.

struct **target_distribution_policy**

`#include <target_distribution_policy.hpp>` This class specifies the parameters for a simple distribution policy to use for creating (and evenly distributing) a given number of items on a given set of localities.

Public Functions

target_distribution_policy() = default

Default-construct a new instance of a `target_distribution_policy`. This policy will represent one locality (the local locality).

inline `target_distribution_policy operator()` (`id_type const &id`) const

Create a new `target_distribution_policy` representing the given locality

Parameters `loc` – [in] The locality the new instance should represent

template<typename **Component**, typename ...**Ts**>

inline `hpx::future<hpx::id_type> create(Ts&&... vs) const`

Create one object on one of the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters `vs` – [in] The arguments which will be forwarded to the constructor of the new object.

Returns A future holding the global address which represents the newly created object

template<bool **WithCount**, typename **Component**, typename ...**Ts**>

```
inline hpx::future<std::vector<bulk_locality_result>> bulk_create(std::size_t count, Ts&&... vs)  
    const
```

Create multiple objects on the localities associated by this policy instance

Note: This function is part of the placement policy implemented by this class

Parameters

- **count** – [in] The number of objects to create
- **vs** – [in] The arguments which will be forwarded to the constructors of the new objects.

Returns A future holding the list of global addresses which represent the newly created objects

```
template<typename Action, typename ...Ts>  
inline async_result<Action>::type async(launch policy, Ts&&... vs) const
```

```
template<typename Action, typename Callback, typename ...Ts>  
inline async_result<Action>::type async_cb(launch policy, Callback &&cb, Ts&&... vs) const
```

Note: This function is part of the invocation policy implemented by this class

```

```
template<typename Action, typename Continuation, typename Callback, typename ...Ts>  
inline bool apply_cb(Continuation &&c, launch policy, Callback &&cb, Ts&&... vs) const
```

Note: This function is part of the invocation policy implemented by this class

```
template<typename Action, typename Callback, typename ...Ts>  
inline bool apply_cb(launch policy, Callback &&cb, Ts&&... vs) const
```

```
inline std::size_t get_num_localities() const
```

Returns the number of associated localities for this distribution policy

Note: This function is part of the creation policy implemented by this class

```
inline hpx::id_type get_next_target() const
```

Returns the locality which is anticipated to be used for the next async operation

```
template<typename Action>
```

```
struct async_result
```

```
#include <target_distribution_policy.hpp>
```

Note: This function is part of the invocation policy implemented by this class

Public Types

```

executors_distributed

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx/executors_distributed/distribution_policy_executor.hpp

Defined in header hpx/executors_distributed/distribution_policy_executor.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **execution**

namespace **experimental**

Functions

```
template<typename DistPolicy>
distribution_policy_executor(DistPolicy&&) ->
    distribution_policy_executor<std::decay_t<DistPolicy>>
```

```
template<typename DistPolicy> HPX_DEPRECATED_V(1, 9,
" hpx::parallel::execution::make_distribution_policy_executor is \"deprecated,
use \" \"hpx::parallel::execution::distribution_policy_executor instead\") distribution_policy
```

Create a new *distribution_policy_executor* from the given distribution_policy.

Parameters **policy** – The distribution_policy to create an executor from

```
template<typename DistPolicy>
```

```
class distribution_policy_executor
#include <distribution_policy_executor.hpp> A distribution_policy_executor creates groups of parallel execution agents that execute in threads implicitly created by the executor and placed on any of the associated localities.
```

Template Parameters *DistPolicy* – The distribution policy type for which an executor should be created. The expression *hpx::traits::is_distribution_policy_v<DistPolicy>* must evaluate to true.

init_runtime

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx::finalize, hpx::disconnect

Defined in header `hpx/init.hpp`⁷⁹³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

int **finalize**(double shutdown_timeout, double localwait = -1.0, *error_code* &ec = *throws*)

Main function to gracefully terminate the HPX runtime system.

The function *hpx::finalize* is the main way to (gracefully) exit any HPX application. It must be called at least once, but can be called multiple times as well. However, only the first invocation will have effect. It will notify all connected localities to finish execution. Only after all other localities have exited this function will return, allowing to exit the console locality as well.

During the execution of this function the runtime system will invoke all registered shutdown functions (see *hpx::init*) on all localities.

The default value (-1.0) will try to find a globally set timeout value (can be set as the configuration parameter `hpx.shutdown_timeout`), and if that is not set or -1.0 as well, it will disable any timeout, each connected locality will wait for all existing HPX-threads to terminate.

The default value (-1.0) will try to find a globally set wait time value (can be set as the configuration parameter “`hpx.finalize_wait_time`”), and if this is not set or -1.0 as well, it will disable any addition local wait time before proceeding.

This function will block and wait for all connected localities to exit before returning to the caller. It should be the last HPX-function called by any application.

Using this function is an alternative to *hpx::disconnect*, these functions do not need to be called both.

⁷⁹³ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/init_runtime/include/hpx/init.hpp

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **shutdown_timeout** – This parameter allows to specify a timeout (in microseconds), specifying how long any of the connected localities should wait for pending tasks to be executed. After this timeout, all suspended HPX-threads will be aborted. Note, that this function will not abort any running HPX-threads. In any case the shutdown will not proceed as long as there is at least one pending/running HPX-thread.
- **localwait** – This parameter allows to specify a local wait time (in microseconds) before the connected localities will be notified and the overall shutdown process starts.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function will always return zero.

inline int **finalize**(*error_code* &*ec* = *throws*)

Main function to gracefully terminate the HPX runtime system.

The function *hpx::finalize* is the main way to (gracefully) exit any HPX application. It must be called at least once, but can be called multiple times as well. However, only the first invocation will have effect. It will notify all connected localities to finish execution. Only after all other localities have exited this function will return, allowing to exit the console locality as well.

During the execution of this function the runtime system will invoke all registered shutdown functions (see *hpx::init*) on all localities.

This function will block and wait for all connected localities to exit before returning to the caller. It should be the last HPX-function called by any application.

Using this function is an alternative to *hpx::disconnect*, these functions do not need to be called both.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function will always return zero.

void **terminate**()

Terminate any application non-gracefully.

The function *hpx::terminate* is the non-graceful way to exit any application immediately. It can be called from any locality and will terminate all localities currently used by the application.

Note: This function will cause HPX to call *std::terminate()* on all localities associated with this application. If the function is called not from an HPX thread it will fail and return an error using the argument *ec*.

```
int disconnect(double shutdown_timeout, double localwait = -1.0, error_code &ec = throws)
```

Disconnect this locality from the application.

The function *hpx::disconnect* can be used to disconnect a locality from a running HPX application.

During the execution of this function the runtime system will invoke all registered shutdown functions (see *hpx::init*) on this locality.

The default value (-1.0) will try to find a globally set timeout value (can be set as the configuration parameter “*hpx.shutdown_timeout*”), and if that is not set or -1.0 as well, it will disable any timeout, each connected locality will wait for all existing HPX-threads to terminate.

The default value (-1.0) will try to find a globally set wait time value (can be set as the configuration parameter *hpx.finalize_wait_time*), and if this is not set or -1.0 as well, it will disable any addition local wait time before proceeding.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called by any locality being disconnected.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn’t throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **shutdown_timeout** – This parameter allows to specify a timeout (in microseconds), specifying how long this locality should wait for pending tasks to be executed. After this timeout, all suspended HPX-threads will be aborted. Note, that this function will not abort any running HPX-threads. In any case the shutdown will not proceed as long as there is at least one pending/running HPX-thread.
- **localwait** – This parameter allows to specify a local wait time (in microseconds) before the connected localities will be notified and the overall shutdown process starts.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns This function will always return zero.

```
inline int disconnect(error_code &ec = throws)
```

Disconnect this locality from the application.

The function *hpx::disconnect* can be used to disconnect a locality from a running HPX application.

During the execution of this function the runtime system will invoke all registered shutdown functions (see *hpx::init*) on this locality.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called by any locality being disconnected.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn’t throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns This function will always return zero.

```
int stop(error_code &ec = throws)
```

Stop the runtime system.

This function will block and wait for this locality to finish executing before returning to the caller. It should be the last HPX-function called on every locality. This function should be used only if the runtime system was started using `hpx::start`.

Returns The function returns the value, which has been returned from the user supplied main HPX function (usually `hpx_main`).

hpx/hpx_init.hpp

Defined in header `hpx/hpx_init.hpp`.

inline int init(std::function<int(hpx::program_options::variables_map&)> f, int argc, char **argv,  
    init_params const &params = init_params())
```

Main entry point for launching the HPX runtime system.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. This overload will not call `hpx_main`.

⁷⁹⁴ http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/init_runtime/include/hpx/init.hpp

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread.

Note: If the parameter `mode` is not given (defaulted), the created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc/argv`. Otherwise, it will be executed as specified by the `parametermode`.

Parameters

- **`f`** – [in] The function to be scheduled as an HPX thread. Usually this function represents the main entry point of any HPX application. If `f` is `nullptr` the HPX runtime environment will be started without invoking `f`.
- **`argc`** – [in] The number of command line arguments passed in `argv`. This is usually the unchanged value as passed by the operating system (to `main()`).
- **`argv`** – [in] The command line arguments for this application, usually that is the value as passed by the operating system (to `main()`).
- **`params`** – [in] The parameters to the `hpx::init` function (See documentation of `hpx::init_params`)

Returns The function returns the value, which has been returned from the user supplied `f`.

```
inline int init(std::function<int(int, char**) > f, int argc, char **argv, init_params const &params = init_params())
```

Main entry point for launching the HPX runtime system.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread. This overload will not call `hpx_main`.

This is the main entry point for any HPX application. This function (or one of its overloads below) should be called from the users `main()` function. It will set up the HPX runtime environment and schedule the function given by `f` as a HPX thread.

Note: The created runtime system instance will be executed in console or worker mode depending on the command line arguments passed in `argc/argv`. If no command line arguments are passed, console mode is assumed.

Note: If no command line arguments are passed the HPX runtime system will not support any of the default command line options as described in the section ‘HPX Command Line Options’.

Parameters `params` – [in] The parameters to the `hpx::start` function (See documentation of `hpx::init_params`)

Returns The function returns `true` if command line processing succeeded and the runtime system was started successfully. It will return `false` otherwise.

hpx::suspend, hpx::resume

Defined in header `hpx/init.hpp`⁷⁹⁷.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace `hpx`

Functions

int **suspend**(*error_code* &ec = *throws*)

Suspend the runtime system.

The function `hpx::suspend` is used to suspend the HPX runtime system. It can only be used when running HPX on a single locality. It will block waiting for all thread pools to be empty. This function only be called when the runtime is running, or already suspended in which case this function will do nothing.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Parameters `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns This function will always return zero.

int **resume**(*error_code* &ec = *throws*)

Resume the HPX runtime system.

The function `hpx::resume` is used to resume the HPX runtime system. It can only be used when running HPX on a single locality. It will block waiting for all thread pools to be resumed. This function only be called when the runtime suspended, or already running in which case this function will do nothing.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn’t throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Parameters `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns This function will always return zero.

hpx/naming_base/unmanaged.hpp

Defined in header hpx/naming_base/unmanaged.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

`hpx::id_type unmanaged(hpx::id_type const &id)`

The helper function `hpx::unmanaged` can be used to generate a global identifier which does not participate in the automatic garbage collection.

Note: This function allows to apply certain optimizations to the process of memory management in HPX. It however requires the user to take full responsibility for keeping the referenced objects alive long enough.

Parameters `id` – [in] The id to generated the unmanaged global id from This parameter can be itself a managed or a unmanaged global id.

Returns This function returns a new global id referencing the same object as the parameter `id`. The only difference is that the returned global identifier does not participate in the automatic garbage collection.

namespace **naming**

Defines

HPX_PARCELPORT_BACKGROUND_MODE_ENUM_DEPRECATED_MSG

namespace **hpx**

 namespace **parcelset**

Typedefs

```
using parcel_write_handler_type = hpx::function<void(std::error_code const&, parcelset::parcel const&)>
```

The type of the function that can be registered as a parcel write handler using the function *hpx::set_parcel_write_handler*.

Note: A parcel write handler is a function which is called by the parcel layer whenever a parcel has been sent by the underlying networking library and if no explicit parcel handler function was specified for the parcel.

Enums

```
enum class parcelport_background_mode : std::uint8_t
```

Type of background work to perform.

Values:

enumerator **flush_buffers**

perform buffer flush operations

enumerator **send**

perform send operations (includes buffer flush)

enumerator **receive**

perform receive operations

enumerator **all**

perform all operations

Functions

```
inline bool operator&(parcelport_background_mode lhs, parcelport_background_mode rhs)
```

```
char const *get_parcelport_background_mode_name(parcelport_background_mode mode)
```

Variables

```
parcel empty_parcel
```

```
constexpr parcelport_background_mode parcelport_background_mode_flush_buffers =  
parcelport_background_mode::flush_buffers
```

```
constexpr parcelport_background_mode parcelport_background_mode_send =  
parcelport_background_mode::send
```

```
constexpr parcelport_background_mode parcelport_background_mode_receive =  
parcelport_background_mode::receive
```

```
constexpr parcelport_background_mode parcelport_background_mode_all =

Functions

```
bool default_counter_discoverer(counter_info const&, discover_counter_func const&,  
discover_counters_mode, error_code&)
```

Default discovery function for performance counters; to be registered with the counter types. It will pass the `counter_info` and the `error_code` to the supplied function.

```
bool locality_counter_discoverer(counter_info const&, discover_counter_func const&,  
discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>(locality#<locality_id>/total)/<instancename>

```
bool locality_pool_counter_discoverer(counter_info const&, discover_counter_func const&,  
discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

/<objectname>(locality#<locality_id>/pool#<pool_name>/total)/<instancename>

```
bool locality0_counter_discoverer(counter_info const&, discover_counter_func const&,
                                  discover_counters_mode, error_code&)
```

Default discoverer function for AGAS performance counters; to be registered with the counter types.
It is suitable to be used for all counters following the naming scheme:

```
/<objectname>{locality#0/total}/<instancename>
```

```
bool locality_thread_counter_discoverer(counter_info const&, discover_counter_func const&,
                                         discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

```
/<objectname>(locality#<locality_id>/worker-thread#<threadnum>)/<instancename>
```

```
bool locality_pool_thread_counter_discoverer(counter_info const &info,
                                              discover_counter_func const &f,
                                              discover_counters_mode mode, error_code
                                              &ec)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

```
/<objectname>{locality#<locality_id>/pool#<poolname>/thread#<threadnum> }/<instancename>
```

```
bool locality_pool_thread_no_total_counter_discoverer(counter_info const &info,
                                                       discover_counter_func const &f,
                                                       discover_counters_mode mode,
                                                       error_code &ec)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

```
/<objectname>{locality#<locality_id>/pool#<poolname>/thread#<threadnum> }/<instancename>
```

This is essentially the same as above just that locality#*/total is not supported.

```
bool locality numa_counter_discoverer(counter_info const&, discover_counter_func const&,
                                         discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

```
/<objectname>(locality#<locality_id>/numa-node#<threadnum>)/<instancename>
```

```
naming::gid_type locality_raw_counter_creator(counter_info const&,
                                                 hpx::function<std::int64_t(bool)> const&,
                                                 error_code&)
```

Creation function for raw counters. The passed function is encapsulating the actual value to monitor.
This function checks the validity of the supplied counter name, it has to follow the scheme:

```
/<objectname>(locality#<locality_id>/total)/<instancename>
```

```
naming::gid_type locality_raw_values_counter_creator(counter_info const&,
                                                       hpx::function<std::vector<std::int64_t>(bool)>
                                                       const&, error_code&)
```

```
naming::gid_type agas_raw_counter_creator(counter_info const&, error_code&, char const*const)
```

Creation function for raw counters. The passed function is encapsulating the actual value to monitor.
This function checks the validity of the supplied counter name, it has to follow the scheme:

```
/agas(<objectinstance>/total)/<instancename>
```

```
bool agas_counter_discoverer(counter_info const&, discover_counter_func const&,
                             discover_counters_mode, error_code&)
```

Default discoverer function for performance counters; to be registered with the counter types. It is suitable to be used for all counters following the naming scheme:

```
/agas(<objectinstance>/total)/<instancename>
```

```
naming::gid_type local_action_invocation_counter_creator(counter_info const&,
                                                               error_code&)
```

```
bool local_action_invocation_counter_discoverer(counter_info const&,
                                                 discover_counter_func const&,
                                                 discover_counters_mode, error_code&)
```

hpx/performance_counters/counters.hpp

Defined in header hpx/performance_counters/counters.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **performance_counters**

TypeDefs

```
typedef hpx::function<naming::gid_type(counter_info const&, error_code&)> create_counter_func
```

This declares the type of a function, which will be called by HPX whenever a new performance counter instance of a particular type needs to be created.

```
typedef hpx::function<bool(counter_info const&, error_code&)> discover_counter_func
```

This declares a type of a function, which will be passed to a *discover_counters_func* in order to be called for each discovered performance counter instance.

```
typedef hpx::function<bool(counter_info const&, discover_counter_func const&,
                           discover_counters_mode, error_code&)> discover_counters_func
```

This declares the type of a function, which will be called by HPX whenever it needs to discover all performance counter instances of a particular type.

Enums

enum class **counter_type**

Values:

enumerator **text**

text shows a variable-length text string. It does not deliver calculated values.

Formula: None Average: None Type: Text

enumerator `raw`

raw shows the last observed value only. It does not deliver an average.

Formula: None. Shows raw data as collected. Average: None Type: Instantaneous

enumerator `monotonically_increasing`

monotonically_increasing shows the cumulatively accumulated observed value. It does not deliver an average.

Formula: None. Shows cumulatively accumulated data as collected. Average: None Type: Instantaneous

enumerator `average_base`

average_base is used as the base data (denominator) in the computation of time or count averages for the `counter_type::average_count` and `counter_type::average_timer` counter types. This counter type collects the last observed value only.

Formula: None. This counter uses raw data in factorial calculations without delivering an output. Average: $\text{SUM } (N) / x$ Type: Instantaneous

enumerator `average_count`

average_count shows how many items are processed, on average, during an operation. Counters of this type display a ratio of the items processed (such as bytes sent) to the number of operations completed. The ratio is calculated by comparing the number of items processed during the last interval to the number of operations completed during the last interval.

Formula: $(N1 - N0) / (D1 - D0)$, where the numerator (N) represents the number of items processed during the last sample interval, and the denominator (D) represents the number of operations completed during the last two sample intervals. Average: $(Nx - N0) / (Dx - D0)$ Type: Average

enumerator `aggregating`

aggregating applies a function to an embedded counter instance. The embedded counter is usually evaluated repeatedly after a fixed (but configurable) time interval.

Formula: $F(Nx)$

enumerator `average_timer`

average_timer measures the average time it takes to complete a process or operation. Counters of this type display a ratio of the total elapsed time of the sample interval to the number of processes or operations completed during that time. This counter type measures time in ticks of the system clock. The variable F represents the number of ticks per second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: $((N1 - N0) / F) / (D1 - D0)$, where the numerator (N) represents the number of ticks counted during the last sample interval, the variable F represents the frequency of the ticks, and the denominator (D) represents the number of operations completed during the last sample interval. Average: $((Nx - N0) / F) / (Dx - D0)$ Type: Average

enumerator `elapsed_time`

elapsed_time shows the total time between when the component or process started and the time when this value is calculated. The variable F represents the number of time units that elapse in one second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: $(D_0 - N_0) / F$, where the nominator (D) represents the current time, the numerator (N) represents the time the object was started, and the variable F represents the number of time units that elapse in one second. Average: $(D_x - N_0) / F$ Type: Difference

enumerator **histogram**

histogram exposes a histogram of the measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a *counter_value*. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

The first three values in the returned array represent the lower and upper boundaries, and the size of the histogram buckets. All remaining values in the returned array represent the number of measurements for each of the buckets in the histogram.

enumerator **raw_values**

raw_values exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a *counter_value*. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

enumerator **text**

enumerator **raw**

enumerator **average_base**

enumerator **average_count**

enumerator **aggregating**

enumerator **average_timer**

enumerator **elapsed_time**

enumerator **histogram**

enumerator **raw_values**

raw_values counter exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a *counter_value*. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

enum class **counter_status**

Status and error codes used by the functions related to performance counters.

Values:

enumerator `valid_data`

No error occurred, data is valid.

enumerator `new_data`

Data is valid and different from last call.

enumerator `invalid_data`

Some error occurred, data is not value.

enumerator `already_defined`

The type or instance already has been defined.

enumerator `counter_unknown`

The counter instance is unknown.

enumerator `counter_type_unknown`

The counter type is unknown.

enumerator `generic_error`

A unknown error occurred.

enumerator `valid_data`**enumerator `new_data`****enumerator `invalid_data`****enumerator `already_defined`****enumerator `counter_unknown`****enumerator `counter_type_unknown`****enumerator `generic_error`**

                    const &uom = "")
```

Public Members

counter_type **type_**

The type of the described counter.

std::uint32_t **version_**

The version of the described counter using the 0xMMmmSSSS scheme

counter_status **status_**

The status of the counter object.

std::string **fullname_**

The full name of this counter.

std::string **helptext_**

The full descriptive text for this counter.

std::string **unit_of_measure_**

The unit of measure for this counter.

Enums

enum class **counter_type**

Values:

enumerator **text**

text shows a variable-length text string. It does not deliver calculated values.

Formula: None Average: None Type: Text

enumerator **raw**

raw shows the last observed value only. It does not deliver an average.

Formula: None. Shows raw data as collected. Average: None Type: Instantaneous

enumerator **monotonically_increasing**

monotonically_increasing shows the cumulatively accumulated observed value. It does not deliver an average.

Formula: None. Shows cumulatively accumulated data as collected. Average: None Type: Instantaneous

enumerator **average_base**

average_base is used as the base data (denominator) in the computation of time or count averages for the *counter_type::average_count* and *counter_type::average_timer* counter types. This counter type collects the last observed value only.

Formula: None. This counter uses raw data in factorial calculations without delivering an output.
Average: SUM (N) / x Type: Instantaneous

enumerator **average_count**

average_count shows how many items are processed, on average, during an operation. Counters of this type display a ratio of the items processed (such as bytes sent) to the number of operations completed. The ratio is calculated by comparing the number of items processed during the last interval to the number of operations completed during the last interval.

Formula: $(N_1 - N_0) / (D_1 - D_0)$, where the numerator (N) represents the number of items processed during the last sample interval, and the denominator (D) represents the number of operations completed during the last two sample intervals. Average: $(N_x - N_0) / (D_x - D_0)$ Type: Average

enumerator **aggregating**

aggregating applies a function to an embedded counter instance. The embedded counter is usually evaluated repeatedly after a fixed (but configurable) time interval.

Formula: $F(N_x)$

enumerator **average_timer**

average_timer measures the average time it takes to complete a process or operation. Counters of this type display a ratio of the total elapsed time of the sample interval to the number of processes or operations completed during that time. This counter type measures time in ticks of the system clock. The variable F represents the number of ticks per second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: $((N1 - N0) / F) / (D1 - D0)$, where the numerator (N) represents the number of ticks counted during the last sample interval, the variable F represents the frequency of the ticks, and the denominator (D) represents the number of operations completed during the last sample interval.
Average: $((Nx - N0) / F) / (Dx - D0)$ Type: Average

enumerator **elapsed_time**

elapsed_time shows the total time between when the component or process started and the time when this value is calculated. The variable F represents the number of time units that elapse in one second. The value of F is factored into the equation so that the result is displayed in seconds.

Formula: $(D0 - N0) / F$, where the nominator (D) represents the current time, the numerator (N) represents the time the object was started, and the variable F represents the number of time units that elapse in one second. Average: $(Dx - N0) / F$ Type: Difference

enumerator **histogram**

histogram exposes a histogram of the measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a *counter_value*. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

The first three values in the returned array represent the lower and upper boundaries, and the size of the histogram buckets. All remaining values in the returned array represent the number of measurements for each of the buckets in the histogram.

enumerator **raw_values**

raw_values exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter_value_array* instead of a *counter_value*. Those will also not implement the *get_counter_value()* functionality. The results are exposed through a separate *get_counter_values_array()* function.

Functions

inline constexpr bool **operator<(counter_type lhs, counter_type rhs)** noexcept

inline constexpr bool **operator>(counter_type lhs, counter_type rhs)** noexcept

std::ostream &operator<<(std::ostream &os, counter_status rhs)

counter_status get_counter_type_name(counter_type_path_elements const &path, std::string &result, error_code &ec = throws)

Create a full name of a counter type from the contents of the given `counter_type_path_elements` instance. The generated counter type name will not contain any parameters.

counter_status get_full_counter_type_name(counter_type_path_elements const &path, std::string &result, error_code &ec = throws)

Create a full name of a counter type from the contents of the given `counter_type_path_elements` instance. The generated counter type name will contain all parameters.

counter_status get_counter_name(counter_path_elements const &path, std::string &result, error_code &ec = throws)

Create a full name of a counter from the contents of the given `counter_path_elements` instance.

counter_status get_counter_instance_name(counter_path_elements const &path, std::string &result, error_code &ec = throws)

Create a name of a counter instance from the contents of the given `counter_path_elements` instance.

counter_status get_counter_type_path_elements(std::string const &name, counter_type_path_elements &path, error_code &ec = throws)

Fill the given `counter_type_path_elements` instance from the given full name of a counter type.

counter_status get_counter_path_elements(std::string const &name, counter_path_elements &path, error_code &ec = throws)

Fill the given `counter_path_elements` instance from the given full name of a counter.

counter_status get_counter_name(std::string const &name, std::string &countername, error_code &ec = throws)

Return the canonical counter instance name from a given full instance name.

counter_status get_counter_type_name(std::string const &name, std::string &type_name, error_code &ec = throws)

Return the canonical counter type name from a given (full) instance name.

```
counter_status discover_counter_types(discover_counter_func const &discover_counter,
                                       discover_counters_mode mode =
                                       discover_counters_mode::minimal, error_code &ec =
                                       throws)
```

Call the supplied function for each registered counter type.

```
counter_status discover_counter_types(std::vector<counter_info> &counters,
                                       discover_counters_mode mode =
                                       discover_counters_mode::minimal, error_code &ec =
                                       throws)
```

Return a list of all available counter descriptions.

```
counter_status discover_counter_type(std::string const &name, discover_counter_func const
                                       &discover_counter, discover_counters_mode mode =
                                       discover_counters_mode::minimal, error_code &ec =
                                       throws)
```

Call the supplied function for the given registered counter type.

```
counter_status discover_counter_type(counter_info const &info, discover_counter_func const
                                       &discover_counter, discover_counters_mode mode =
                                       discover_counters_mode::minimal, error_code &ec =
                                       throws)
```

```
counter_status discover_counter_type(std::string const &name, std::vector<counter_info>
                                       &counters, discover_counters_mode mode =
                                       discover_counters_mode::minimal, error_code &ec =
                                       throws)
```

Return a list of matching counter descriptions for the given registered counter type.

```
counter_status discover_counter_type(counter_info const &info, std::vector<counter_info>
                                       &counters, discover_counters_mode mode =
                                       discover_counters_mode::minimal, error_code &ec =
                                       throws)
```

bool expand_counter_info(counter_info const&, discover_counter_func const&, error_code&)
call the supplied function will all expanded versions of the supplied counter info.

This function expands all locality#* and worker-thread#* wild cards only.

```
counter_status remove_counter_type(counter_info const &info, error_code &ec = throws)
```

Remove an existing counter type from the (local) registry.

Note: This doesn't remove existing counters of this type, it just inhibits defining new counters using this type.

```
counter_status get_counter_type(std::string const &name, counter_info &info, error_code &ec = throws)
```

Retrieve the counter type for the given counter name from the (local) registry.

```
hpx::future<hpx::id_type> get_counter_async(std::string name, error_code &ec = throws)
```

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter name.

```
hpx::future<hpx::id_type> get_counter_async(counter_info const &info, error_code &ec = throws)
```

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter info.

```
void get_counter_infos(counter_info const &info, counter_type &type, std::string &helptext, std::uint32_t &version, error_code &ec = throws)
```

Retrieve the meta data specific for the given counter instance.

```
void get_counter_infos(std::string name, counter_type &type, std::string &helptext, std::uint32_t &version, error_code &ec = throws)
```

Retrieve the meta data specific for the given counter instance.

Variables

```
constexpr counter_type counter_text = counter_type::text
```

```
constexpr counter_type counter_raw = counter_type::raw
```

struct counter_value
```

Public Functions

```
inline counter_value(std::int64_t value = 0, std::int64_t scaling = 1, bool scale_inverse = false)

template<typename T>
inline T get_value(error_code &ec = throws) const
```

Retrieve the ‘real’ value of the `counter_value`, converted to the requested type *T*.

Public Members

`std::uint64_t time_`

The local time when data was collected.

`std::uint64_t count_`

The invocation counter for the data.

`std::int64_t value_`

The current counter value.

`std::int64_t scaling_`

The scaling of the current counter value.

`counter_status status_`

The status of the counter value.

`bool scale_inverse_`

If true, `value_` needs to be divided by `scaling_`, otherwise it has to be multiplied.

Private Functions

```
void serialize(serialization::output_archive &ar, const unsigned int) const
void serialize(serialization::input_archive &ar, const unsigned int)
```

Friends

```
friend class hpx::serialization::access

struct counter_values_array
```

Public Functions

```
inline counter_values_array(std::int64_t scaling = 1, bool scale_inverse = false)
inline counter_values_array(std::vector<std::int64_t> &&values, std::int64_t scaling = 1, bool
                           scale_inverse = false)
inline counter_values_array(std::vector<std::int64_t> const &values, std::int64_t scaling = 1,
                           bool scale_inverse = false)

template<typename T>
inline T get_value(std::size_t index, error_code &ec = throws) const
    Retrieve the ‘real’ value of the counter_value, converted to the requested type T.
```

Public Members

std::uint64_t **time_**

The local time when data was collected.

std::uint64_t **count_**

The invocation counter for the data.

std::vector<*std*::int64_t> **values_**

The current counter values.

std::int64_t **scaling_**

The scaling of the current counter values.

counter_status **status_**

The status of the counter value.

bool **scale_inverse_**

If true, value_ needs to be divided by scaling_, otherwise it has to be multiplied.

Private Functions

hpx/performance_counters/manage_counter_type.hpp

Defined in header hpx/performance_counters/manage_counter_type.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **performance_counters**

Functions

```
counter_status install_counter_type(std::string const &name, hpx::function<std::int64_t(bool)>  
const &counter_value, std::string const &helptext = "",  
std::string const &uom = "", counter_type type =  
counter_type::raw, error_code &ec = throws)
```

Install a new generic performance counter type in a way, which will uninstall it automatically during shutdown.

The function *install_counter_type* will register a new generic counter type based on the provided function. The counter type will be automatically unregistered during system shutdown. Any consumer querying any instance of this counter type will cause the provided function to be called and the returned value to be exposed as the counter value.

The counter type is registered such that there can be one counter instance per locality. The expected naming scheme for the counter instances is: '/objectname{locality#<*>}/total'/countername' where '<*>' is a zero based integer identifying the locality the counter is created on.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Parameters

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.

- **counter_value** – [in] The function to call whenever the counter value is requested by a consumer.
- **helptext** – [in, optional] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **uom** – [in] The unit of measure for the new performance counter type.
- **type** – [in] Type for the new performance counter type.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns If successful, this function returns *valid_data*, otherwise it will either throw an exception or return an *error_code* from the enum *counter_status* (also, see note related to parameter *ec*).

```
counter_status install_counter_type(std::string const &name,
                                    hpx::function<std::vector<std::int64_t>(bool)> const
                                    &counter_value, std::string const &helptext = "", std::string
                                    const &uom = "", error_code &ec = throws)
```

Install a new generic performance counter type returning an array of values in a way, that will uninstall it automatically during shutdown.

The function *install_counter_type* will register a new generic counter type that returns an array of values based on the provided function. The counter type will be automatically unregistered during system shutdown. Any consumer querying any instance of this counter type will cause the provided function to be called and the returned array value to be exposed as the counter value.

The counter type is registered such that there can be one counter instance per locality. The expected naming scheme for the counter instances is: '/objectname{locality#<*>/total}/countername' where '<*>' is a zero based integer identifying the locality the counter is created on.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Parameters

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **counter_value** – [in] The function to call whenever the counter value (array of values) is requested by a consumer.
- **helptext** – [in, optional] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **uom** – [in] The unit of measure for the new performance counter type.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns If successful, this function returns *valid_data*, otherwise it will either throw an exception or return an *error_code* from the enum *counter_status* (also, see note related to parameter *ec*).

```
void install_counter_type(std::string const &name, counter_type type, error_code &ec = throws)
```

Install a new performance counter type in a way, which will uninstall it automatically during shutdown.

The function *install_counter_type* will register a new counter type based on the provided

counter_type_info. The counter type will be automatically unregistered during system shutdown.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **type** – [in] The type of the counters of this counter_type.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns If successful, this function returns *valid_data*, otherwise it will either throw an exception or return an *error_code* from the enum *counter_status* (also, see note related to parameter *ec*).

```
counter_status install_counter_type(std::string const &name, counter_type type, std::string const  
                                &helptext, std::string const &uom = "", std::uint32_t version =  
                                HPX_PERFORMANCE_COUNTER_V1, error_code &ec =  
                                throws)
```

Install a new performance counter type in a way, which will uninstall it automatically during shutdown.

The function *install_counter_type* will register a new counter type based on the provided *counter_type_info*. The counter type will be automatically unregistered during system shutdown.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **type** – [in] The type of the counters of this counter_type.
- **helptext** – [in] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **uom** – [in] The unit of measure for the new performance counter type.
- **version** – [in] The version of the counter type. This is currently expected to be set to HPX_PERFORMANCE_COUNTER_V1.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns If successful, this function returns *valid_data*, otherwise it will either throw an exception or return an *error_code* from the enum *counter_status* (also, see note related to parameter *ec*).

```
counter_status install_counter_type(std::string const &name, counter_type type, std::string const
&helptext, create_counter_func const &create_counter,
discover_counters_func const &discover_counters,
std::uint32_t version =
HPX_PERFORMANCE_COUNTER_V1, std::string const
&uom = "", error_code &ec = throws)
```

Install a new generic performance counter type in a way, which will uninstall it automatically during shutdown.

The function *install_counter_type* will register a new generic counter type based on the provided *counter_type_info*. The counter type will be automatically unregistered during system shutdown.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: The counter type registry is a locality based service. You will have to register each counter type on every locality where a corresponding performance counter will be created.

Parameters

- **name** – [in] The global virtual name of the counter type. This name is expected to have the format /objectname/countername.
- **type** – [in] The type of the counters of this counter_type.
- **helptext** – [in] A longer descriptive text shown to the user to explain the nature of the counters created from this type.
- **version** – [in] The version of the counter type. This is currently expected to be set to HPX_PERFORMANCE_COUNTER_V1.
- **create_counter** – [in] The function which will be called to create a new instance of this counter type.
- **discover_counters** – [in] The function will be called to discover counter instances which can be created.
- **uom** – [in] The unit of measure of the counter type (default: "")
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns If successful, this function returns *valid_data*, otherwise it will either throw an exception or return an *error_code* from the enum *counter_status* (also, see note related to parameter *ec*).

hpx/performance_counters/registry.hpp

Defined in header hpx/performance_counters/registry.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **performance_counters**

 class **registry**

Public Functions

registry() = default

void clear()

Reset registry by deleting all stored counter types.

counter_status add_counter_type(counter_info const &info, create_counter_func const &create_counter, discover_counters_func const &discover_counters, error_code &ec = throws)

Add a new performance counter type to the (local) registry.

counter_status discover_counter_types(discover_counter_func discover_counter, discover_counters_mode mode, error_code &ec = throws) const

Call the supplied function for all registered counter types.

counter_status discover_counter_type(std::string const &fullname, discover_counter_func discover_counter, discover_counters_mode mode, error_code &ec = throws)

Call the supplied function for the given registered counter type.

inline counter_status discover_counter_type(counter_info const &info, discover_counter_func const &f, discover_counters_mode mode, error_code &ec = throws)

counter_status get_counter_create_function(counter_info const &info, create_counter_func &create_counter, error_code &ec = throws) const

Retrieve the counter creation function which is associated with a given counter type.

counter_status get_counter_discovery_function(counter_info const &info, discover_counters_func &func, error_code &ec) const

Retrieve the counter discovery function which is associated with a given counter type.

counter_status remove_counter_type(counter_info const &info, error_code &ec = throws)

Remove an existing counter type from the (local) registry.

Note: This doesn't remove existing counters of this type, it just inhibits defining new counters using this type.

counter_status create_raw_counter_value(counter_info const &info, std::int64_t *countervalue, naming::gid_type &id, error_code &ec = throws)

Create a new performance counter instance of type raw_counter based on given counter value.

counter_status create_raw_counter(counter_info const &info, hpx::function<std::int64_t()> const &f, naming::gid_type &id, error_code &ec = throws)

Create a new performance counter instance of type raw_counter based on given function returning the counter value.

counter_status create_raw_counter(counter_info const &info, hpx::function<std::int64_t(bool)> const &f, naming::gid_type &id, error_code &ec = throws)

Create a new performance counter instance of type raw_counter based on given function returning the counter value.

```
counter_status create_raw_counter(counter_info const &info,  
                                hpx::function<std::vector<std::int64_t>()> const &f,  
                                naming::gid_type &id, error_code &ec = throws)
```

Create a new performance counter instance of type raw_counter based on given function returning the counter value.

```
counter_status create_raw_counter(counter_info const &info,  
                                hpx::function<std::vector<std::int64_t>(bool)> const &f,  
                                naming::gid_type &id, error_code &ec = throws)
```

Create a new performance counter instance of type raw_counter based on given function returning the counter value.

```
counter_status create_counter(counter_info const &info, naming::gid_type &id, error_code &ec  
                               = throws)
```

Create a new performance counter instance based on given counter info.

```
counter_status create_statistics_counter(counter_info const &info, std::string const  
                                         &base_counter_name, std::vector<std::size_t> const &parameters,  
                                         naming::gid_type &id,  
                                         error_code &ec = throws)
```

Create a new statistics performance counter instance based on given base counter name and given base time interval (milliseconds).

```
counter_status create_arithmetics_counter(counter_info const &info, std::vector<std::string> const  
                                         &base_counter_names, naming::gid_type &id, error_code &ec = throws)
```

Create a new arithmetics performance counter instance based on given base counter names.

```
counter_status create_arithmetics_counter_extended(counter_info const &info,  
                                                 std::vector<std::string> const  
                                                 &base_counter_names,  
                                                 naming::gid_type &id, error_code &ec = throws)
```

Create a new extended arithmetics performance counter instance based on given base counter names.

```
counter_status add_counter(hpx::id_type const &id, counter_info const &info, error_code &ec =  
                           throws)
```

Add an existing performance counter instance to the registry.

```
counter_status remove_counter(counter_info const &info, hpx::id_type const &id, error_code &ec =  
                           throws)
```

remove the existing performance counter from the registry

```
counter_status get_counter_type(std::string const &name, counter_info &info, error_code &ec  
                               = throws)
```

Retrieve counter type information for given counter name.

hpx/plugin_factories/binary_filter_factory.hpp

Defined in header hpx/plugin_factories/binary_filter_factory.hpp.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_REGISTER_BINARY_FILTER_FACTORY(BinaryFilter, pluginname)

This macro is used to create and to register a minimal component factory with `Hpx.Plugin`.

namespace **hpx**

namespace **plugins**

```
template<typename BinaryFilter>
struct binary_filter_factory : public binary_filter_factory_base
{
    #include <binary_filter_factory.hpp> The message_handler_factory provides a minimal implementation
    // of a message handler's factory. If no additional functionality is required this type can be used to
    // implement the full set of minimally required functions to be exposed by a message handler's factory
    // instance.
    Template Parameters BinaryFilter – The message handler type this factory should be
    // responsible for.
```

Public Functions

inline **binary_filter_factory**(*util*::section const *global, *util*::section const *local, bool
isenable)

Construct a new factory instance.

Note: The contents of both sections has to be cloned in order to save the configuration setting for later use.

Parameters

- **global** – [in] The pointer to a *hpx::util::section* instance referencing the settings read from the [settings] section of the global configuration file (*hpx.ini*) This pointer may be `nullptr` if no such section has been found.
- **local** – [in] The pointer to a *hpx::util::section* instance referencing the settings read from the section describing this component type: [*hpx.components.<name>*], where *<name>* is the instance name of the component as given in the configuration files.
- **isenable** –

~binary_filter_factory() override = default

inline *serialization*::binary_filter ***create**(bool compress, *serialization*::binary_filter *next_filter =
`nullptr`) override

Create a new instance of a message handler

return Returns the newly created instance of the message handler supported by this factory

Protected Attributes

`util::section global_settings_`

`util::section local_settings_`

`bool isenabled_`

Defines

`HPX_REGISTER_PLUGIN_REGISTRY(...)`

This macro is used create and to register a minimal plugin registry with `Hpx.Plugin`.

`HPX_REGISTER_PLUGIN_REGISTRY_(...)`

`HPX_REGISTER_PLUGIN_REGISTRY_2(PluginType, pluginname)`

`HPX_REGISTER_PLUGIN_REGISTRY_4(PluginType, pluginname, pluginsection, pluginsuffix)`

`HPX_REGISTER_PLUGIN_REGISTRY_5(PluginType, pluginname, pluginstring, pluginsection, pluginsuffix)`

namespace `hpx`

namespace `plugins`

```
template<typename Plugin, char const *const Name, char const *const Section, char const *const  
Suffix>
```

```
struct plugin_registry : public plugin_registry_base
```

```
#include <plugin_registry.hpp> The plugin_registry provides a minimal implementation of a plugin's  
registry. If no additional functionality is required this type can be used to implement the full set of  
minimally required functions to be exposed by a plugin's registry instance.
```

Template Parameters `Plugin` – The plugin type this registry should be responsible for.

Public Functions

inline bool **get_plugin_info**(*std*::vector<*std*::string> &fillini) override

Return the ini-information for all contained components.

Parameters **fillini** – [in] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.

Returns Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

runtime_components

See *Public API* for a list of names and headers that are part of the public *HPX API*.

HPX_REGISTER_COMPONENT

Defined in header *hpx/components.hpp*.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

Defines

HPX_REGISTER_COMPONENT(*type*, *name*, *mode*)

Define a component factory for a component type.

This macro is used create and to register a minimal component factory for a component type which allows it to be remotely created using the *hpx::new_<>* function.

This macro can be invoked with one, two or three arguments

Parameters

- **type** – The *type* parameter is a (fully decorated) type of the component type for which a factory should be defined.
- **name** – The *name* parameter specifies the name to use to register the factory. This should uniquely (system-wide) identify the component type. The *name* parameter must conform to the C++ identifier rules (without any namespace). If this parameter is not given, the first parameter is used.
- **mode** – The *mode* parameter has to be one of the defined enumeration values of the enumeration *hpx::components::factory_state*. The default for this parameter is *hpx::components::factory_state::enabled*.

hpx/runtime_components/component_registry.hpp

Defined in header *hpx/runtime_components/component_registry.hpp*.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

Defines

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY(...)

This macro is used to register a minimal component registry with `Hpx.Plugin`.

HPX_REGISTER_MINIMAL_COMPONENT_REGISTRY_(...)

namespace **hpx**

namespace **components**

template<typename **Component**, *factory_state* **state**>

struct **component_registry** : public *component_registry_base*

#include <*component_registry.hpp*> The `component_registry` provides a minimal implementation of a component's registry. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a component's registry instance.

Template Parameters Component – The component type this registry should be responsible for.

Public Functions

inline bool **get_component_info**(*std::vector<std::string>* &fillini, *std::string const &filepath*, *bool is_static* = false) override

Return the ini-information for all contained components.

Parameters

- **fillini** – [in] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.
- **filepath** –
- **is_static** –

Returns Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

inline void **register_component_type**() override

Enables this type of registry and sets its destroy mechanism.

hpx/runtime_components/components_fwd.hpp

Defined in header hpx/runtime_components/components_fwd.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

Defines

HPX_REGISTER_DERIVED_COMPONENT_FACTORY(...)

This macro is used to create and register a minimal component factory with Hpx.Plugin. This macro may be used if the registered component factory is the only factory to be exposed from a particular module. If more than one factory needs to be exposed the *HPX_REGISTER_COMPONENT_FACTORY* and *HPX_REGISTER_COMPONENT_MODULE* macros should be used instead.

HPX_REGISTER_DERIVED_COMPONENT_FACTORY(...)

HPX_REGISTER_DERIVED_COMPONENT_FACTORY_3(ComponentType, componentname, basecomponentname)

HPX_REGISTER_DERIVED_COMPONENT_FACTORY_4(ComponentType, componentname, basecomponentname, state)

HPX_REGISTER_DERIVED_COMPONENT_FACTORY_DYNAMIC(...)

HPX_REGISTER_DERIVED_COMPONENT_FACTORY_DYNAMIC(...)

HPX_REGISTER_DERIVED_COMPONENT_FACTORY_DYNAMIC_3(ComponentType, componentname, basecomponentname)

HPX_REGISTER_DERIVED_COMPONENT_FACTORY_DYNAMIC_4(ComponentType, componentname,
basecomponentname, state)

hpx::new_

Defined in header hpx/components.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename Component, typename ...Ts>
auto new_(id_type const &locality, Ts&&... vs)
```

Create one or more new instances of the given Component type on the specified locality.

This function creates one or more new instances of the given Component type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =
    hpx::new_<some_component>(hpx::find_here(), ...);
hpx::id_type id = f.get();
```

Parameters

- **locality** – [in] The global address of the locality where the new instance should be created on.
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument *Component* represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

```
template<typename Component, typename ...Ts>
```

```
auto local_new(Ts&&... vs)
```

Create one new instance of the given Component type on the current locality.

This function creates one new instance of the given Component type on the current locality and returns a future object for the global address which can be used to reference the new component instance.

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =
    hpx::local_new<some_component>(...);
hpx::id_type id = f.get();
```

Note: The difference of this function to `hpx::new_` is that it can be used in cases where the supplied arguments are non-copyable and non-movable. All operations are guaranteed to be local only.

Parameters **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component. If the first argument is `hpx::launch::sync` the function will directly return an `hpx::id_type`.
- If the explicit template argument *Component* represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

```
template<typename Component, typename ...Ts>
auto new_(id_type const &locality, std::size_t count, Ts&&... vs)
```

Create multiple new instances of the given Component type on the specified locality.

This function creates multiple new instances of the given Component type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<std::vector<hpx::id_type>> f =
    hpx::new_<some_component[]>(hpx::find_here(), 10, ...);
hpx::id_type id = f.get();
```

Parameters

- **locality** – [in] The global address of the locality where the new instance should be created on.

- **count** – [in] The number of component instances to create
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument *Component* represents an array of a component type (i.e. *Component*[], where `traits::is_component<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which holds a `std::vector<hpx::id_type>`, where each of the items in this vector is a global address of one of the newly created components.
- If the explicit template argument *Component* represents an array of a client side object type (i.e. *Component*[], where `traits::is_client<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which holds a `std::vector<hpx::id_type>`, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

```
template<typename Component, typename DistPolicy, typename ...Ts>
auto new_(DistPolicy const &policy, Ts&&... vs)
```

Create one or more new instances of the given Component type based on the given distribution policy.

This function creates one or more new instances of the given Component type on the localities defined by the given distribution policy and returns a future object for global address which can be used to reference the new component instance(s).

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =
    hpx::new_<some_component>(hpx::default_layout, ...);
hpx::id_type id = f.get();
```

Parameters

- **policy** – [in] The distribution policy used to decide where to place the newly created.
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument *Component* represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

```
template<typename Component, typename DistPolicy, typename ...Ts>
```

```
auto new_(DistPolicy const &policy, std::size_t count, Ts&&... vs)
```

Create multiple new instances of the given Component type on the localities as defined by the given distribution policy.

This function creates multiple new instances of the given Component type on the localities defined by the given distribution policy and returns a future object for the global address which can be used to reference the new component instance.

Note: This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<std::vector<hpx::id_type>> f =
    hpx::new_<some_component[]>(hpx::default_layout, 10, ...);
hpx::id_type id = f.get();
```

Parameters

- **policy** – [in] The distribution policy used to decide where to place the newly created.
- **count** – [in] The number of component instances to create
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

Returns The function returns different types depending on its use:

- If the explicit template argument *Component* represents an array of a component type (i.e. *Component*[], where *traits*::*is_component*<*Component*>::*value* evaluates to true), the function will return an *hpx::future* object instance which holds a *std::vector*<*hpx::id_type*>, where each of the items in this vector is a global address of one of the newly created components.
- If the explicit template argument *Component* represents an array of a client side object type (i.e. *Component*[], where *traits*::*is_client*<*Component*>::*value* evaluates to true), the function will return an *hpx::future* object instance which holds a *std::vector*<*hpx::id_type*>, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

runtime_distributed

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx/runtime_distributed.hpp

Defined in header *hpx/runtime_distributed.hpp*.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

```
class runtime_distributed : public runtime
```

#include <runtime_distributed.hpp> The *runtime* class encapsulates the HPX runtime system in a simple to use way. It makes sure all required parts of the HPX runtime system are properly initialized.

Public Functions

```
explicit runtime_distributed(util::runtime_configuration &rtcfg, int (*pre_main)(runtime_mode) =  
    nullptr, void (*post_main)() = nullptr)
```

Construct a new HPX runtime instance

Parameters

- **rtcfg** – Runtime configuration for this instance
- **pre_main** – Function to be called before running the main action of this instance
- **post_main** – Function to be called after running the main action of this instance

~runtime_distributed()

The destructor makes sure all HPX runtime services are properly shut down before exiting.

```
int start(hpx::function<hpx_main_function_type> const &func, bool blocking = false) override
```

Start the runtime system.

Parameters

- **func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*.
- **blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally.

Returns If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter **func**. Otherwise it will return zero.

```
int start(bool blocking = false) override
```

Start the runtime system.

Parameters **blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally .

Returns If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter **func**. Otherwise it will return zero.

int wait() override

Wait for the shutdown action to be executed.

Returns This function will return the value as returned as the result of the invocation of the function object given by the parameter **func**.

```
void stop(bool blocking = true) override
```

Initiate termination of the runtime system.

Parameters **blocking** – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

```
int finalize(double shutdown_timeout) override
```

```
void stop_helper(bool blocking, std::condition_variable &cond, std::mutex &mtx)
```

Stop the runtime system, wait for termination.

Parameters

- **blocking** – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

- **cond** – Condition used to update all thread when done
- **mtx** – Mutex used by this function to sync all threads

int **suspend()** override

Suspend the runtime system.

int **resume()** override

Resume the runtime system.

bool **report_error**(*std*::size_t num_thread, *std*::exception_ptr const &e, bool terminate_all = true) override

Report a non-recoverable error to the runtime system.

Parameters

- **num_thread** – [in] The number of the operating system thread the error has been detected in.
- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] Kill all localities attached to the currently running application (default: true)

bool **report_error**(*std*::exception_ptr const &e, bool terminate_all = true) override

Report a non-recoverable error to the runtime system.

Note: This function will retrieve the number of the current shepherd thread and forward to the report_error function above.

Parameters

- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] Kill all localities attached to the currently running application (default: true)

int **run**(*hpx::function*<*hpx_main_function_type*> const &func) override

Run the HPX runtime system, use the given function for the main *thread* and block waiting for all threads to finish.

Note: The parameter *func* is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

Parameters **func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

Returns This function will return the value as returned as the result of the invocation of the function object given by the parameter *func*.

int **run()** override

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

Returns This function will always return 0 (zero).

bool **is_networking_enabled()** override

template<typename **F**>

```
inline components::server::console_error_dispatcher::sink_type set_error_sink(F &&sink)  
performance_counters::registry &get_counter_registry()  
    Allow access to the registry counter registry instance used by the HPX runtime.  
performance_counters::registry const &get_counter_registry() const  
    Allow access to the registry counter registry instance used by the HPX runtime.  
register_query_counters(std::shared_ptr<util::query_counters> const &active_counters)  
start_active_counters(error_code &ec = throws) const  
stop_active_counters(error_code &ec = throws) const  
reset_active_counters(error_code &ec = throws) const  
reinit_active_counters(bool reset = true, error_code &ec = throws) const  
evaluate_active_counters(bool reset = false, char const *description = nullptr, error_code &ec = throws) const  
stop_evaluating_counters(bool terminate = false) const  
naming::resolver_client &get_agas_client()  
    Allow access to the AGAS client instance used by the HPX runtime.  
hpx::threads::threadmanager &get_thread_manager() override  
    Allow access to the thread manager instance used by the HPX runtime.  
applier::applier &get_applier()  
    Allow access to the applier instance used by the HPX runtime.  
std::string here() const override  
    Returns a string of the locality endpoints (usable in debug output)  
naming::address_type get_runtime_support_lva() const  
naming::gid_type get_next_id(std::size_t count = 1)  
init_id_pool_range()  
util::unique_id_ranges &get_id_pool()  
initialize_agas()  
    Initialize AGAS operation.  
add_pre_startup_function(startup_function_type f) override  
    Add a function to be executed inside a HPX thread before hpx_main but guaranteed to be executed before any startup function registered with add_startup_function.
```

Note: The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

Parameters *f* – The function ‘*f*’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

```
void add_startup_function(startup_function_type f) override
```

Add a function to be executed inside a HPX thread before hpx_main

Parameters **f** – The function ‘f’ will be called from inside a HPX thread before hpx_main is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

```
void add_pre_shutdown_function(shutdown_function_type f) override
```

Add a function to be executed inside a HPX thread during hpx::finalize, but guaranteed before any of the shutdown functions is executed.

Note: The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

Parameters **f** – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

```
void add_shutdown_function(shutdown_function_type f) override
```

Add a function to be executed inside a HPX thread during hpx::finalize

Parameters **f** – The function ‘f’ will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

```
hpx::util::io_service_pool *get_thread_pool(char const *name) override
```

Access one of the internal thread pools (io_service instances) HPX is using to perform specific tasks. The three possible values for the argument name are “main_pool”, “io_pool”, “parcel_pool”, and “timer_pool”. For any other argument value the function will return zero.

```
bool register_thread(char const *name, std::size_t num = 0, bool service_thread = true, error_code &ec = throws) override
```

Register an external OS-thread with HPX.

```
notification_policy_type get_notification_policy(char const *prefix, runtime_local::os_thread_type type) override
```

Generate a new notification policy instance for the given thread name prefix

```
std::uint32_t get_locality_id(error_code &ec) const override
```

```
std::size_t get_num_worker_threads() const override
```

```
std::uint32_t get_num_localities(hpx::launch::sync_policy, error_code &ec) const override
```

```
std::uint32_t get_initial_num_localities() const override
```

```
hpx::future<std::uint32_t> get_num_localities() const override
```

```
std::string get_locality_name() const override
```

```
std::uint32_t get_num_localities(hpx::launch::sync_policy, components::component_type type, error_code &ec) const
```

```
hpx::future<std::uint32_t> get_num_localities(components::component_type type) const
```

```
std::uint32_t assign_cores(std::string const &locality_basename, std::uint32_t num_threads) override
```

```
std::uint32_t assign_cores() override
```

Public Static Functions

```
static void register_counter_types()
```

Install all performance counters related to this runtime instance.

hpx/runtime_distributed/applier.hpp

Defined in header `hpx/runtime_distributed/applier.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **applier**

class **applier**

#include <applier.hpp> The *applier* class is used to decide whether a particular action has to be issued on a local or a remote resource. If the target component is local a new *thread* will be created, if the target is remote a parcel will be sent.

Public Functions

HPX_NON_COPYABLE(*applier*)

applier()

void **init**(*threads::threadmanager* &tm)

~applier() = default

void **initialize**(*std*::uint64_t rts)

threads::threadmanager &**get_thread_manager**()

Access the *thread-manager* instance associated with this *applier*.

This function returns a reference to the thread manager this applier instance has been created with.

naming::gid_type const &**get_raw_locality**(*error_code* &ec = *throws*) const

Allow access to the locality of the locality this applier instance is associated with.

This function returns a reference to the locality this applier instance is associated with.

std::uint32_t **get_locality_id**(*error_code* &ec = *throws*) const

Allow access to the id of the locality this applier instance is associated with.

This function returns a reference to the id of the locality this applier instance is associated with.

```
bool get_raw_remote_localities(std::vector<naming::gid_type> &locality_ids,  
                               components::component_type type =  
                               to_int(hpx::components::component_enum_type::invalid),  
                               error_code &ec = throws) const
```

Return list of localities of all remote localities registered with the AGAS service for a specific component type.

This function returns a list of all remote localities (all localities known to AGAS except the local one) supporting the given component type.

Parameters

- **locality_ids** – [out] The reference to a vector of id_types filled by the function.
- **type** – [in] The type of the component which needs to exist on the returned localities.

Returns The function returns *true* if there is at least one remote locality known to the AGAS service (!prefixes.empty()).

```
bool get_remote_localities(std::vector<hpx::id_type> &locality_ids,  
                           components::component_type type =  
                           to_int(hpx::components::component_enum_type::invalid),  
                           error_code &ec = throws) const
```

```
bool get_raw_localities(std::vector<naming::gid_type> &locality_ids,  
                        components::component_type type =  
                        to_int(hpx::components::component_enum_type::invalid)) const
```

Return list of locality_ids of all localities registered with the AGAS service for a specific component type.

This function returns a list of all localities (all localities known to AGAS except the local one) supporting the given component type.

Parameters

- **locality_ids** – [out] The reference to a vector of id_types filled by the function.
- **type** – [in] The type of the component which needs to exist on the returned localities.

Returns The function returns *true* if there is at least one remote locality known to the AGAS service (!prefixes.empty()).

```
bool get_localities(std::vector<hpx::id_type> &locality_ids, error_code &ec = throws) const
```

```
bool get_localities(std::vector<hpx::id_type> &locality_ids, components::component_type  
type, error_code &ec = throws) const
```

```
inline naming::gid_type const &get_runtime_support_raw_gid() const

Private Members

`threads::threadmanager *thread_manager_`

`hpx::id_type runtime_support_id_`

hpx/runtime_distributed/applier_fwd.hpp

Defined in header `hpx/runtime_distributed/applier_fwd.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **applier**

Functions

`applier &get_applier()`

The function `get_applier` returns a reference to the (thread specific) applier instance.

`applier *get_applier_ptr()`

The function `get_applier` returns a pointer to the (thread specific) applier instance. The returned pointer is NULL if the current thread is not known to HPX or if the runtime system is not active.

namespace **applier**

The namespace `applier` contains all definitions needed for the class `hpx::applier::applier` and its related functionality. This namespace is part of the HPX core module.

hpx/runtime_distributed/copy_component.hpp

Defined in header `hpx/runtime_distributed/copy_component.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **components**

Functions

```
template<typename Component>
future<hpx::id_type> copy(hpx::id_type const &to_copy)
```

Copy given component to the specified target locality.

The function `copy<Component>` will create a copy of the component referenced by `to_copy` on the locality specified with `target_locality`. It returns a future referring to the newly created component instance.

Note: The new component instance is created on the locality of the component instance which is to be copied.

Parameters `to_copy` – [in] The global id of the component to copy

Template Parameters `The` – only template argument specifies the component type to create.

Returns A future representing the global id of the newly (copied) component instance.

```
template<typename Component>
future<hpx::id_type> copy(hpx::id_type const &to_copy, hpx::id_type const &target_locality)
```

Copy given component to the specified target locality.

The function `copy<Component>` will create a copy of the component referenced by `to_copy` on the locality specified with `target_locality`. It returns a future referring to the newly created component instance.

Parameters

- `to_copy` – [in] The global id of the component to copy
- `target_locality` – [in] The locality where the copy should be created.

Template Parameters `The` – only template argument specifies the component type to create.

Returns A future representing the global id of the newly (copied) component instance.

```
template<typename Derived, typename Stub, typename Data>
Derived copy(client_base<Derived, Stub, Data> const &to_copy, hpx::id_type const &target_locality =
hpx::invalid_id)
```

Copy given component to the specified target locality.

The function `copy` will create a copy of the component referenced by the client side object `to_copy` on the locality specified with `target_locality`. It returns a new client side object future referring to the newly created component instance.

Note: If the second argument is omitted (or is `invalid_id`) the new component instance is created on the locality of the component instance which is to be copied.

Parameters

- `to_copy` – [in] The client side object representing the component to copy
- `target_locality` – [in, optional] The locality where the copy should be created (default is same locality as source).

Template Parameters `The` – only template argument specifies the component type to create.

Returns A future representing the global id of the newly (copied) component instance.

`hpx::find_root_locality`, `hpx::find_all_localities`, `hpx::find_remote_localities`

Defined in header `hpx/runtime.hpp`⁷⁹⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

`hpx::id_type find_root_locality(error_code &ec = throws)`

Return the global id representing the root locality.

The function `find_root_locality()` can be used to retrieve the global id usable to refer to the root locality. The root locality is the locality where the main AGAS service is hosted.

See also:

`hpx::find_all_localities()`, `hpx::find_locality()`

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Note: This function will return meaningful results only if called from an HPX-thread. It will return `hpx::invalid_id` otherwise.

Parameters `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns The global id representing the root locality for this application.

`std::vector<hpx::id_type> find_all_localities(error_code &ec = throws)`

Return the list of global ids representing all localities available to this application.

The function `find_all_localities()` can be used to retrieve the global ids of all localities currently available to this application.

See also:

`hpx::find_here()`, `hpx::find_locality()`

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

⁷⁹⁸ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/runtime.hpp>

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The global ids representing the localities currently available to this application.

std::vector<hpx::id_type> find_remote_localities(error_code &ec = throws)

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function *find_remote_localities()* can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one).

See also:

hpx::find_here(), *hpx::find_locality()*

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The global ids representing the remote localities currently available to this application.

hpx/runtime_distributed/find_here.hpp

Defined in header *hpx/runtime_distributed/find_here.hpp*.

See *Public API* for a list of names and headers that are part of the public *HPX API*.

namespace **hpx**

Functions

`hpx::id_type find_here(error_code &ec = throws)`

Return the global id representing this locality.

The function `find_here()` can be used to retrieve the global id usable to refer to the current locality.

See also:

`hpx::find_all_localities()`, `hpx::find_locality()`

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Note: This function will return meaningful results only if called from an HPX-thread. It will return `hpx::invalid_id` otherwise.

Parameters `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns The global id representing the locality this function has been called on.

`hpx::find_locality`

Defined in header `hpx/runtime.hpp`⁷⁹⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace `hpx`

Functions

`std::vector<hpx::id_type> find_all_localities(components::component_type type, error_code &ec = throws)`

Return the list of global ids representing all localities available to this application which support the given component type.

The function `find_all_localities()` can be used to retrieve the global ids of all localities currently available to this application which support the creation of instances of the given component type.

See also:

`hpx::find_here()`, `hpx::find_locality()`

⁷⁹⁹ <http://github.com/STELLAR-GROUP/hpx/blob/3a2b72ae3a27ae503a6b7cae938611590932c42d/libs/full/include/include/hpx/runtime.hpp>

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters

- **type** – [in] The type of the components for which the function should return the available localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns The global ids representing the localities currently available to this application which support the creation of instances of the given component type. If no localities supporting the given component type are currently available, this function will return an empty vector.

std::vector<hpx::id_type> find_remote_localities(components::component_type type, error_code &ec = throws)

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function *find_remote_localities()* can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one) which support the creation of instances of the given component type.

See also:

[hpx::find_here\(\)](#), [hpx::find_locality\(\)](#)

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

Parameters

- **type** – [in] The type of the components for which the function should return the available remote localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns The global ids representing the remote localities currently available to this application.

`hpx::id_type find_locality(components::component_type type, error_code &ec = throws)`

Return the global id representing an arbitrary locality which supports the given component type.

The function `find_locality()` can be used to retrieve the global id of an arbitrary locality currently available to this application which supports the creation of instances of the given component type.

See also:

`hpx::find_here()`, `hpx::find_all_localities()`

Note: Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Note: This function will return meaningful results only if called from an HPX-thread. It will return `hpx::invalid_id` otherwise.

Parameters

- **type** – [in] The type of the components for which the function should return any available locality.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

Returns The global id representing an arbitrary locality currently available to this application which supports the creation of instances of the given component type. If no locality supporting the given component type is currently available, this function will return `hpx::invalid_id`.

hpx/runtime_distributed/get_locality_name.hpp

Defined in header `hpx/runtime_distributed/get_locality_name.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

`future<std::string> get_locality_name(hpx::id_type const &id)`

Return the name of the referenced locality.

This function returns a future referring to the name for the locality of the given id.

See also:

`std::string get_locality_name()`

Parameters `id` – [in] The global id of the locality for which the name should be retrieved

Returns This function returns the name for the locality of the given id. The name is retrieved from the underlying networking layer and may be different for different parcel ports.

hpx/runtime_distributed/get_num_localities.hpp

Defined in header `hpx/runtime_distributed/get_num_localities.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace `hpx`

Functions

`hpx::future<std::uint32_t> get_num_localities(components::component_type t)`

Asynchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` asynchronously returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

See also:

`hpx::find_all_localities`, `hpx::get_num_localities`

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Parameters `t` – The component type for which the number of connected localities should be retrieved.

`std::uint32_t get_num_localities(launch::sync_policy, components::component_type t, error_code &ec = throws)`

Synchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

See also:

hpx::find_all_localities, *hpx::get_num_localities*

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Parameters

- **t** – The component type for which the number of connected localities should be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx/runtime_distributed/migrate_component.hpp

Defined in header `hpx/runtime_distributed/migrate_component.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **components**

Functions

```
template<typename Component, typename DistPolicy>
future<hpx::id_type> migrate(hpx::id_type const &to_migrate, [[maybe_unused]] DistPolicy const &policy)
```

Migrate the given component to the specified target locality

The function *migrate*<*Component*> will migrate the component referenced by *to_migrate* to the locality specified with *target_locality*. It returns a future referring to the migrated component instance.

Parameters

- **to_migrate** – [in] The client side representation of the component to migrate.
- **policy** – [in] A distribution policy which will be used to determine the locality to migrate this object to.

Template Parameters

- **Component** – Specifies the component type of the component to migrate.
- **DistPolicy** – Specifies the distribution policy to use to determine the destination locality.

Returns A future representing the global id of the migrated component instance. This should be the same as *migrate_to*.

```
template<typename Derived, typename Stub, typename Data, typename DistPolicy>
Derived migrate(client_base<Derived, Stub, Data> const &to_migrate, DistPolicy const &policy)
```

Migrate the given component to the specified target locality

The function *migrate*<*Component*> will migrate the component referenced by *to_migrate* to the locality specified with *target_locality*. It returns a future referring to the migrated component instance.

Parameters

- **to_migrate** – [in] The client side representation of the component to migrate.

- **policy** – [in] A distribution policy which will be used to determine the locality to migrate this object to.

Template Parameters

- **Derived** – Specifies the component type of the component to migrate.
- **DistPolicy** – Specifies the distribution policy to use to determine the destination locality.

Returns A future representing the global id of the migrated component instance. This should be the same as *migrate_to*.

```
template<typename Component>
future<hpx::id_type> migrate(hpx::id_type const &to_migrate, hpx::id_type const &target_locality)
```

Migrate the component with the given id to the specified target locality

The function *migrate*<*Component*> will migrate the component referenced by *to_migrate* to the locality specified with *target_locality*. It returns a future referring to the migrated component instance.

Parameters

- **to_migrate** – [in] The global id of the component to migrate.
- **target_locality** – [in] The locality where the component should be migrated to.

Template Parameters Component – Specifies the component type of the component to migrate.

Returns A future representing the global id of the migrated component instance. This should be the same as *migrate_to*.

```
template<typename Derived, typename Stub, typename Data>
Derived migrate(client_base<Derived, Stub, Data> const &to_migrate, hpx::id_type const
&target_locality)
```

Migrate the given component to the specified target locality

The function *migrate*<*Component*> will migrate the component referenced by *to_migrate* to the locality specified with *target_locality*. It returns a future referring to the migrated component instance.

Parameters

- **to_migrate** – [in] The client side representation of the component to migrate.
- **target_locality** – [in] The id of the locality to migrate this object to.

Template Parameters Derived – Specifies the component type of the component to migrate.

Returns A client side representation of representing of the migrated component instance. This should be the same as *migrate_to*.

hpx/runtime_distributed/runtime_fwd.hpp

Defined in header hpx/runtime_distributed/runtime_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
runtime_distributed &get_runtime_distributed()
runtime_distributed *&get_runtime_distributed_ptr()
naming::gid_type const &get_locality()
```

The function `get_locality` returns a reference to the locality prefix.

```
void start_active_counters(error_code &ec = throws)
```

Start all active performance counters, optionally naming the section of code.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Note: The active counters are those which have been specified on the command line while executing the application (see command line option `-hpx:print-counter`)

Parameters `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
void reset_active_counters(error_code &ec = throws)
```

Resets all active performance counters.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Note: The active counters are those which have been specified on the command line while executing the application (see command line option `-hpx:print-counter`)

Parameters `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
void reinit_active_counters(bool reset = true, error_code &ec = throws)
```

Re-initialize all active performance counters.

Note: As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise it throws an instance of `hpx::exception`.

Note: The active counters are those which have been specified on the command line while executing the application (see command line option `-hpx:print-counter`)

Parameters

- `reset` – [in] Reset the current values before re-initializing counters (default: true)

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
void stop_active_counters(error_code &ec = throws)
```

Stop all active performance counters.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: The active counters are those which have been specified on the command line while executing the application (see command line option `-hpx:print-counter`)

Parameters **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
void evaluate_active_counters(bool reset = false, char const *description = nullptr, error_code &ec = throws)
```

Evaluate and output all active performance counters, optionally naming the point in code marked by this function.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Note: The output generated by this function is redirected to the destination specified by the corresponding command line options (see `-hpx:print-counter-destination`).

Note: The active counters are those which have been specified on the command line while executing the application (see command line option `-hpx:print-counter`)

Parameters

- **reset** – [in] this is an optional flag allowing to reset the counter value after it has been evaluated.
- **description** – [in] this is an optional value naming the point in the code marked by the call to this function.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
serialization::binary_filter *create_binary_filter(char const *binary_filter_type, bool compress,  
                                                 serialization::binary_filter *next_filter = nullptr,  
                                                 error_code &ec = throws)
```

Create an instance of a binary filter plugin.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **binary_filter_type** – [in] The type of the binary filter to create
- **compress** – [in] The created filter should support compression
- **next_filter** – [in] Use this as the filter to dispatch the invocation into.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx/runtime_distributed/runtime_support.hpp

Defined in header `hpx/runtime_distributed/runtime_support.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

```

`hpx/runtime_distributed/server/runtime_support.hpp`

Defined in header `hpx/runtime_distributed/server/runtime_support.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **components**

 namespace **server**

 class **runtime_support**

Public Types

```
using type_holder = runtime_support
```

Public Functions

```
explicit runtime_support(hpx::util::runtime_configuration &cfg)  
inline ~runtime_support()  
void delete_function_lists()  
void tidy()  
  
template<typename Component>  
naming::gid_type create_component()  
    Actions to create new objects.  
  
template<typename Component, typename T, typename ...Ts>  
naming::gid_type create_component(T v, Ts... vs)  
  
template<typename Component, typename ...Ts>  
std::vector<naming::gid_type> bulk_create_component(std::size_t count, Ts... vs)  
  
template<typename Component, typename ...Ts>  
std::vector<naming::gid_type> bulk_create_component_with_count(std::size_t count, Ts... vs)  
  
template<typename Component>  
naming::gid_type copy_create_component(std::shared_ptr<Component> const &p, bool)  
  
template<typename Component>  
naming::gid_type migrate_component_to_here(std::shared_ptr<Component> const &p,  
                                              hpx::id_type)  
  
void shutdown(double timeout, hpx::id_type const &respond_to)  
    Gracefully shutdown this runtime system instance.  
void shutdown_all(double timeout)  
    Gracefully shutdown runtime system instances on all localities.  
void terminate(hpx::id_type const &respond_to)  
    Shutdown this runtime system instance.  
inline void terminate_act(hpx::id_type const &id)  
void terminate_all()  
    Shutdown runtime system instances on all localities.  
inline void terminate_all_act()  
  
util::section get_config()  
    Retrieve configuration information.  
int load_components()  
    Load all components on this locality.
```

```

void call_startup_functions(bool pre_startup)
void call_shutdown_functions(bool pre_shutdown)
void garbage_collect()
    Force a garbage collection operation in the AGAS layer.
naming::gid_type create_performance_counter(performance_counters::counter_info const
&info)
    Create the given performance counter instance.
void remove_from_connection_cache(naming::gid_type const &gid,
                                parcelset::endpoints_type const &eps)
    Remove the given locality from our connection cache.

HPX_DEFINE_COMPONENT_ACTION (runtime_support, terminate_act,
terminate_action) HPX_DEFINE_COMPONENT_ACTION(runtime_support
termination detection

terminate_all_action HPX_DEFINE_COMPONENT_ACTION (runtime_support,
remove_from_connection_cache) void run()
    Start the runtime_support component.

void wait()
    Wait for the runtime_support component to notify the calling thread.

    This function will be called from the main thread, causing it to block while the HPX functionality is executed. The main thread will block until the shutdown_action is executed, which in turn notifies all waiting threads.

void stop(double timeout, hpx::id_type const &respond_to, bool remove_from_remote_caches)
    Notify all waiting (blocking) threads allowing the system to be properly stopped.

```

Note: This function can be called from any thread.

```

void stopped()
    called locally only
void notify_waiting_main()
inline bool was_stopped() const
void add_pre_startup_function(startup_function_type f)
void add_startup_function(startup_function_type f)
void add_pre_shutdown_function(shutdown_function_type f)
void add_shutdown_function(shutdown_function_type f)
void remove_here_from_connection_cache()
void remove_here_from_console_connection_cache()

```

Public Members

`terminate_all_act`

Public Static Functions

```
static inline component_type get_component_type()
static inline void set_component_type(component_type t)
static inline constexpr void finalize()
    finalize() will be called just before the instance gets destructed
static inline bool is_target_valid(hpx::id_type const &id)
```

Protected Functions

hpx/runtime_distributed/stubs/runtime_support.hpp

Defined in header hpx/runtime_distributed/stubs/runtime_support.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 namespace **components**

 namespace **stubs**

 struct **runtime_support**

 Subclassed by *hpx::components::runtime_support*

Public Static Functions

template<typename **Component**, typename ...**Ts**>

static inline *hpx::future<hpx::id_type>* **create_component_async**(*hpx::id_type const &gid,*
Ts&&... vs)

Create a new component *type* using the *runtime_support* with the given *targetgid*. This is a non-blocking call. The caller needs to call *future::get* on the result of this function to obtain the global id of the newly created object.

template<typename **Component**, typename ...**Ts**>

static inline *hpx::id_type* **create_component**(*hpx::id_type const &gid, Ts&&... vs*)

Create a new component *type* using the *runtime_support* with the given *targetgid*. Block for the creation to finish.

template<bool **WithCount**, typename **Component**, typename ...**Ts**>

static inline *hpx::future<std::vector<hpx::id_type>>* **bulk_create_component_colocated_async**(*hpx::id_type const &gid,*
std::size_t count, Ts&&... vs)

Create multiple new components *type* using the *runtime_support* colocated with the given *targetgid*. This is a non-blocking call.

template<bool **WithCount**, typename **Component**, typename ...**Ts**>

static inline *std::vector<hpx::id_type>* **bulk_create_component_colocated**(*hpx::id_type const &gid,*
std::size_t count, Ts&&... vs)

Create multiple new components *type* using the *runtime_support* colocated with the given *targetgid*. Block for the creation to finish.

template<bool **WithCount**, typename **Component**, typename ...**Ts**>

```
static inline hpx::future<std::vector<hpx::id_type>> bulk_create_component_async(hpx::id_type
    const
    &gid,
    std::size_t
    count,
    Ts&&...
    vs)
```

Create multiple new components *type* using the *runtime_support* on the given locality. This is a non-blocking call.

```
template<bool WithCount, typename Component, typename ...Ts>
static inline std::vector<hpx::id_type> bulk_create_component(hpx::id_type const &gid,
    std::size_t count, Ts&&...
    vs)
```

Create multiple new components *type* using the *runtime_support* on the given locality. Block for the creation to finish.

```
template<typename Component, typename ...Ts>
static inline hpx::future<hpx::id_type> create_component_colocated_async(hpx::id_type
    const &gid,
    Ts&&... vs)
```

Create a new component *type* using the *runtime_support* with the given *targetgid*. This is a non-blocking call. The caller needs to call *future::get* on the result of this function to obtain the global id of the newly created object.

```
template<typename Component, typename ...Ts>
static inline hpx::id_type create_component_colocated(hpx::id_type const &gid, Ts&&...
    vs)
```

Create a new component *type* using the *runtime_support* with the given *targetgid*. Block for the creation to finish.

```
template<typename Component>

    Convert &&conv_op)

```

2.9 Contributing to HPX

HPX development happens on Github. The following sections are a collection of useful information related to HPX development.

2.9.1 Contributing to HPX

The main source of information to understand the process of how to contribute to HPX can be found in [this document⁸⁰⁰](#). This is a living document that is constantly updated with relevant information.

2.9.2 HPX governance model

The *HPX* project is a meritocratic, consensus-based community project. Anyone with an interest in the project can join the community, contribute to the project design and participate in the decision making process. [This document⁸⁰¹](#) describes how that participation takes place and how to set about earning merit within the project community.

2.9.3 Release procedure for HPX

Below is a step by step procedure for making an *HPX* release. We aim to produce two releases per year: one in March-April, and one in September-October.

This is a living document and may not be totally current or accurate. It is an attempt to capture current practices in making an *HPX* release. Please update it as appropriate.

One way to use this procedure is to print a copy and check off the lines as they are completed to avoid confusion.

1. Notify developers that a release is imminent.
2. For minor and major releases: create and check out a new branch at an appropriate point on `master` with the name `release-major.minor.X`. `major` and `minor` should be the major and minor versions of the release. For patch releases: check out the corresponding `release-major.minor.X` branch.
3. Write release notes in `docs/sphinx/releases/whats_new_{$VERSION}.rst`. Keep adding merged PRs and closed issues to this until just before the release is made. Use `tools/generate_pr_issue_list.sh` to generate the lists. Add the new release notes to the table of contents in `docs/sphinx/releases.rst`.
4. Build the docs, and proof-read them. Update any documentation that may have changed, and correct any typos. Pay special attention to:
 - `$HPX_SOURCE/README.rst`
 - Update grant information
 - `docs/sphinx/releases/whats_new_{$VERSION}.rst`
 - `docs/sphinx/about_hpx/people.rst`
 - Update collaborators
 - Update grant information
5. This step does not apply to patch releases. For APEX:
 - Change the release branch to be the most current release tag available in the APEX `git_external` section in the main `CMakeLists.txt`. Please contact the maintainers of the respective packages to generate a new release to synchronize with the *HPX* release ([APEX⁸⁰²](#)).
6. Make sure `HPX_VERSION_MAJOR/MINOR/SUBMINOR` in `CMakeLists.txt` contain the correct values. Change them if needed.
7. Change version references in `CITATION.cff`. There are two occurrences. Change year in the copyright file under `/libs/core/version/src/version.cpp`.

⁸⁰⁰ <https://github.com/STELLAR-GROUP/hpx/blob/master/.github/CONTRIBUTING.md>

⁸⁰¹ <http://hpx.stellar-group.org/documents/governance/>

⁸⁰² <http://github.com/UO-OACISS/xpress-apex>

8. This step does not apply to patch releases. Remove features which have been deprecated for at least 2 releases. This involves removing build options which enable those features from the main CMakeLists.txt and also deleting all related code and tests from the main source tree.

The general deprecation policy involves a three-step process we have to go through in order to introduce a breaking change:

- a. First release cycle: add a build option that allows for explicitly disabling any old (now deprecated) code.
- b. Second release cycle: turn this build option OFF by default.
- c. Third release cycle: completely remove the old code.

The main CMakeLists.txt contains a comment indicating for which version the breaking change was introduced first. In the case of deprecated features which don't have a replacement yet, we keep them around in case (like Vc for example).

9. Update the minimum required versions if necessary (compilers, dependencies, etc.) in `prerequisites.rst`.
10. Verify that the Jenkins setups for the release branch on Rostam and Piz Daint are running and do not display any errors.
11. Repeat the following steps until satisfied with the release.
 1. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to `-rcN`, where N is the current iteration of this step. Start with `-rc1`.
 2. Create a pre-release on GitHub using the script `tools/roll_release.sh`. This script automatically tag with the corresponding release number. The script requires that you have the STE||AR Group signing key.
 3. This step is not necessary for patch releases. Notify `hpx-users@stellar-group.org` of the availability of the release candidate. Ask users to test the candidate by checking out the release candidate tag.
 4. Allow at least a week for testing of the release candidate.
 - Use `git merge` when possible, and fall back to `git cherry-pick` when needed. For patch releases `git cherry-pick` is most likely your only choice if there have been significant unrelated changes on master since the previous release.
 - Go back to the first step when enough patches have been added.
 - If there are no more patches, continue to make the final release.
12. Update any occurrences of the latest stable release to refer to the version about to be released. For example, `quickstart.rst` contains instructions to check out the latest stable tag. Make sure that refers to the new version.
13. Add a new entry to the RPM changelog (`cmake/packaging/rpm/Changelog.txt`) with the new version number and a link to the corresponding changelog.
14. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to an empty string.
15. Add the release date to the caption of the current “What’s New” section in the docs, and change the value of `HPX_VERSION_DATE` in `CMakeLists.txt`.
16. Create a release on GitHub using the script `tools/roll_release.sh`. This script automatically tag the with the corresponding release number. The script requires that you have the STE||AR Group signing key.
17. Update the websites ([`hpx.stellar-group.org`](https://hpx.stellar-group.org)⁸⁰³ and `stellar-group.org <https://stellar-group.org>`). You can login on wordpress through *this page* `<https://hpx.stellar-group.org/wp-login.php>`. You can update the pages with the following:
 - Update links on the downloads page. Link to the release on GitHub.

⁸⁰³ <https://hpx.stellar-group.org>

- Documentation links on the docs page (link to generated documentation on GitHub Pages). Follow the style of previous releases.
- A new blog post announcing the release, which links to downloads and the “What’s New” section in the documentation (see previous releases for examples).

18. Merge release branch into master.

19. Post-release cleanup. Create a new pull request against master with the following changes:

1. Modify the release procedure if necessary.
2. Change HPX_VERSION_TAG in CMakeLists.txt back to -trunk.
3. Increment HPX_VERSION_MINOR in CMakeLists.txt.

20. Update Vcpkg (<https://github.com/Microsoft/vcpkg>) to pull from latest release.

- Update version number in CONTROL
- Update tag and SHA512 to that of the new release

21. Update spack (<https://github.com/spack/spack>) with the latest HPX package.

- Update version number in hpx/package.py and SHA256 to that of the new release

22. Announce the release on hpx-users@stellar-group.org, stellar@cct.lsu.edu, allcct@cct.lsu.edu, faculty@csc.lsu.edu, faculty@ece.lsu.edu, the *HPX* Slack channel, the IRC channel, our list of external collaborators, isocpp.org, reddit.com, HPC Wire, Inside HPC, Heise Online, and a CCT press release.

23. Beer and pizza.

2.9.4 Testing HPX

To ensure correctness of *HPX*, we ship a large variety of unit and regression tests. The tests are driven by the CTest⁸⁰⁴ tool and are executed automatically on each commit to the *HPX* Github⁸⁰⁵ repository. In addition, it is encouraged to run the test suite manually to ensure proper operation on your target system. If a test fails for your platform, we highly recommend submitting an issue on our *HPX* Issues⁸⁰⁶ tracker with detailed information about the target system.

Running tests manually

Running the tests manually is as easy as typing `make tests && make test`. This will build all tests and run them once the tests are built successfully. After the tests have been built, you can invoke separate tests with the help of the `ctest` command. You can list all available test targets using `make help | grep tests`. Please see the CTest Documentation⁸⁰⁷ for further details.

⁸⁰⁴ <https://gitlab.kitware.com/cmake/community/wikis/doc/ctest/Testing-With-CTest>

⁸⁰⁵ <https://github.com/STELLAR-GROUP/hpx/>

⁸⁰⁶ <https://github.com/STELLAR-GROUP/hpx/issues>

⁸⁰⁷ <https://www.cmake.org/cmake/help/latest/manual/ctest.1.html>

Running performance tests

We run performance tests on Piz Daint for each pull request using Jenkins. To run those performance tests locally or on Piz Daint, a script is provided under `tools/perftests_ci/local_run.sh` (to be run in the build directory specifying the *HPX* source directory as the argument to the script, default is `$HOME/projects/hpx_perftests_ci`.

Adding new performance tests

To add a new performance test, you need to wrap the portion of code to benchmark with `hpx::util::perftests_report`, passing the test name, the executor name and the function to time (can be a lambda). This facility is used to output the time results in a json format (format needed to compare the results and plot them). To effectively print them at the end of your test, call `hpx::util::perftests_print_times`. To see an example of use, see `future_overhead_report.cpp`. Finally, you can add the test to the CI report editing the `hpx_targets` variable for the executable name and the `hpx_test_options` variable for the corresponding options to use for the run in the performance test script `.jenkins/cscs-perftests/launch_perftests.sh`. And then run the `tools/perftests_ci/local_run.sh` script to get a reference json run (use the name of the test) to be added in the `tools/perftests_ci/perftest/references/daint_default` directory.

Issue tracker

If you stumble over a bug or missing feature in *HPX*, please submit an issue to our [HPX Issues⁸⁰⁸](#) page. For more information on how to submit support requests or other means of getting in contact with the developers, please see the [Support Website⁸⁰⁹](#) page.

Continuous testing

In addition to manual testing, we run automated tests on various platforms. We also run tests on all pull requests using both [CircleCI⁸¹⁰](#) and a combination of [CDash⁸¹¹](#) and [pycicle⁸¹²](#). You can see the dashboards here: [CircleCI HPX dashboard⁸¹³](#) and [CDash HPX dashboard⁸¹⁴](#).

2.9.5 Using docker for development

Although it can often be useful to set up a local development environment with system-provided or self-built dependencies, [Docker⁸¹⁵](#) provides a convenient alternative to quickly get all the dependencies needed to start development of *HPX*. Our testing setup on [CircleCI⁸¹⁶](#) uses a docker image to run all tests.

To get started you need to install [Docker⁸¹⁷](#) using whatever means is most convenient on your system. Once you have [Docker⁸¹⁸](#) installed, you can pull or directly run the docker image. The image is based on Debian and Clang, and can be found on [Docker Hub⁸¹⁹](#). To start a container using the *HPX* build environment, run:

⁸⁰⁸ <https://github.com/STELLAR-GROUP/hpx/issues>

⁸⁰⁹ <https://stellar.cct.lsu.edu/support/>

⁸¹⁰ <https://circleci.com>

⁸¹¹ <https://www.kitware.com/cdash/project/about.html>

⁸¹² <https://github.com/biddisco/pycicle/>

⁸¹³ <https://circleci.com/gh/STELLAR-GROUP/hpx>

⁸¹⁴ <https://cdash.rostam.cct.lsu.edu/index.php?project=HPX>

⁸¹⁵ <https://www.docker.com>

⁸¹⁶ <https://circleci.com>

⁸¹⁷ <https://www.docker.com>

⁸¹⁸ <https://www.docker.com>

⁸¹⁹ https://hub.docker.com/r/stellargroup/build_env/

```
$ docker run --interactive --tty stellargroup/build_env:latest bash
```

You are now in an environment where all the *HPX* build and runtime dependencies are present. You can install additional packages according to your own needs. Please see the [Docker Documentation⁸²⁰](#) for more information on using Docker⁸²¹.

Warning: All changes made within the container are lost when the container is closed. If you want files to persist (e.g., the *HPX* source tree) after closing the container, you can bind directories from the host system into the container (see [Docker Documentation \(Bind mounts\)⁸²²](#)).

2.9.6 Documentation

This documentation is built using [Sphinx⁸²³](#), and an automatically generated API reference using [Doxygen⁸²⁴](#) and [Breathe⁸²⁵](#).

We always welcome suggestions on how to improve our documentation, as well as pull requests with corrections and additions.

Prerequisites

To build the *HPX* documentation, you need recent versions of the following packages:

- `python3`
- `sphinx 4.5.0` (Python package)
- `sphinx-book-theme` (Python package)
- `breathe 4.33.1` (Python package)
- `doxygen`
- `sphinxcontrib-bibtex`
- `sphinx-copybutton`

If the [Python⁸²⁶](#) dependencies are not available through your system package manager, you can install them using the Python package manager `pip`:

```
pip install --user "sphinx<5" sphinx-book-theme breathe sphinxcontrib-bibtex sphinx-  
copybutton
```

You may need to set the following CMake variables to make sure CMake can find the required dependencies.

`Doxygen_ROOT:PATH`

Specifies where to look for the installation of the [Doxygen⁸²⁷](#) tool.

⁸²⁰ <https://docs.docker.com/>

⁸²¹ <https://www.docker.com>

⁸²² <https://docs.docker.com/storage/bind-mounts/>

⁸²³ <http://www.sphinx-doc.org>

⁸²⁴ <https://www.doxygen.org>

⁸²⁵ <https://breathe.readthedocs.io/en/latest>

⁸²⁶ <https://www.python.org>

⁸²⁷ <https://www.doxygen.org>

Sphinx_ROOT:PATH

Specifies where to look for the installation of the [Sphinx](#)⁸²⁸ tool.

Breathe_APIDOC_ROOT:PATH

Specifies where to look for the installation of the [Breathe](#)⁸²⁹ tool.

Building documentation

Enable building of the documentation by setting `HPX_WITH_DOCUMENTATION=ON` during [CMake](#)⁸³⁰ configuration. To build the documentation, build the `docs` target using your build tool. The default output format is HTML documentation. You can choose alternative output formats (single-page HTML, PDF, and man) with the `HPX_WITH_DOCUMENTATION_OUTPUT_FORMATS` CMake option.

Note: If you add new source files to the Sphinx documentation, you have to run CMake again to have the files included in the build.

Style guide

The documentation is written using reStructuredText. These are the conventions used for formatting the documentation:

- Use, at most, 80 characters per line.
- Top-level headings use over- and underlines with =.
- Sub-headings use only underlines with characters in decreasing level of importance: =, - and ..
- Use sentence case in headings.
- Refer to common terminology using :term:`Component`.
- Indent content of directives (.. directive::) by three spaces.
- For C++ code samples at the end of paragraphs, use :: and indent the code sample by 4 spaces.
 - For other languages (or if you don't want a colon at the end of the paragraph), use .. code-block:: language and indent by three spaces as with other directives.
- Use .. list-table:: to wrap tables with a lot of text in cells.

API documentation

The source code is documented using Doxygen. If you add new API documentation either to existing or new source files, make sure that you add the documented source files to the `doxygen_dependencies` variable in `docs/CMakeLists.txt`.

⁸²⁸ <http://www.sphinx-doc.org>

⁸²⁹ <https://breathe.readthedocs.io/en/latest>

⁸³⁰ <https://www.cmake.org>

2.9.7 Module structure

This section explains the structure of an *HPX* module.

The tool `create_library_skeleton.py`⁸³¹ can be used to generate a basic skeleton. To create a library skeleton, run the tool in the `libs` subdirectory with the module name as an argument:

```
$ ./create_library_skeleton <lib_name>
```

This creates a skeleton with the necessary files for an *HPX* module. It will not create any actual source files. The structure of this skeleton is as follows:

- `<lib_name>/`
 - `README.rst`
 - `CMakeLists.txt`
 - `cmake`
 - `docs/`
 - * `index.rst`
 - `examples/`
 - * `CMakeLists.txt`
 - `include/`
 - * `hpx/`
 - `<lib_name>`
 - `src/`
 - * `CMakeLists.txt`
 - `tests/`
 - * `CMakeLists.txt`
 - * `unit/`
 - `CMakeLists.txt`
 - * `regressions/`
 - `CMakeLists.txt`
 - * `performance/`
 - `CMakeLists.txt`

A `README.rst` should be always included which explains the basic purpose of the library and a link to the generated documentation.

A main `CMakeLists.txt` is created in the root directory of the module. By default it contains a call to `add_hpx_module` which takes care of most of the boilerplate required for a module. You only need to fill in the source and header files in most cases.

`add_hpx_module` requires a module name. Optional flags are:

Optional single-value arguments are:

- `INSTALL_BINARIES`: Install the resulting library.

⁸³¹ https://github.com/STELLAR-GROUP/hpx/blob/master/libs/create_library_skeleton.py

Optional multi-value arguments-are:

- SOURCES: List of source files.
- HEADERS: List of header files.
- COMPAT_HEADERS: List of compatibility header files.
- DEPENDENCIES: Libraries that this module depends on, such as other modules.
- CMAKE_SUBDIRS: List of subdirectories to add to the module.

The `include` directory should contain only headers that other libraries need. For each of those headers, an automatic header test to check for self containment will be generated. Private headers should be placed under the `src` directory. This allows for clear separation. The `cmake` subdirectory may include additional [CMake](#)⁸³² scripts needed to generate the respective build configurations.

Compatibility headers (forwarding headers for headers whose location is changed when creating a module, if moving them from the main library) should be placed in an `include_compatibility` directory. This directory is not created by default.

Documentation is placed in the `docs` folder. A empty skeleton for the index is created, which is picked up by the main build system and will be part of the generated documentation. Each header inside the `include` directory will automatically be processed by Doxygen and included into the documentation.

Tests are placed in suitable subdirectories of `tests`.

When in doubt, consult existing modules for examples on how to structure the module.

Finding circular dependencies

Our CI will perform a check to see if there are circular dependencies between modules. In cases where it's not clear what is causing the circular dependency, running the `cpp-dependencies`⁸³³ tool manually can be helpful. It can give you detailed information on exactly which files are causing the circular dependency. If you do not have the `cpp-dependencies` tool already installed, one way of obtaining it is by using our docker image. This way you will have exactly the same environment as on the CI. See [Using docker for development](#) for details on how to use the docker image.

To produce the graph produced by CI run the following command (`HPX_SOURCE` is assumed to hold the path to the `HPX` source directory):

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --graph-cycles circular_dependencies.dot
```

This will produce a `.dot` file in the current directory. You can inspect this manually with a text editor. You can also convert this to an image if you have `graphviz` installed:

```
$ dot circular_dependencies.dot -Tsvg -o circular_dependencies.svg
```

This produces an `.svg` file in the current directory which shows the circular dependencies. Note that if there are no cycles the image will be empty.

You can use `cpp-dependencies` to print the include paths between two modules.

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest <from> <to>
```

prints all possible paths from the module `<from>` to the module `<to>`. For example, as most modules depend on `config`, the following should give you a long list of paths from `algorithms` to `config`:

⁸³² <https://www.cmake.org>

⁸³³ <https://github.com/tomtom-international/cpp-dependencies>

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest algorithms config
```

The following should report that it can't find a path between the two modules:

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest config algorithms
```

2.10 Releases

2.10.1 List of releases

HPX V1.11.0 (TBA)

General changes

- Added synchronous versions of all collective operations. Added global predefined communicator objects that are accessible through new APIs: `hpx::collectives::get_world_communicator()` refers to all localities and `hpx::collectives::get_local_communicator()` refers to all threads on the calling locality.

Breaking changes

- We have moved most of the APIs that were defined in the namespace `hpx::parallel::execution` to the namespace `hpx::execution::experimental`. It was not possible to add compatibility facilities that will allow to continue using the old APIs, applications will have to be changed in order to continue functioning correctly.
- The CMake configuration parameter `HPX_WITH_RUN_MAIN_EVERYWHERE` is now deprecated and will be removed in the future. Use the preprocessor macro `HPX_HAVE_RUN_MAIN_EVERYWHERE` on a target-by-target case instead.

Closed issues

Closed pull requests

HPX V1.10.0 (May 29, 2024)

General changes

- The HPX documentation has seen a major overhaul for this release. We finished documenting the public local HPX API, we have added migration guides from widely used parallelization platforms to HPX (OpenMP, TBB, and MPI).
- We have added facilities enabling optimizations for trivially-relocatable types (see P1144⁸³⁴ for more details).
- We have added (and use) the `scope_XXX` helper facilities as specified by the C++ library fundamentals TS v3 (see: N4948⁸³⁵).

⁸³⁴ <https://wg21.link/p1144>

⁸³⁵ <http://wg21.link/n4948>

- We have added configuration options that allow to build HPX without pre-installing any prerequisites. Use `HPX_WITH_FETCH_HWLOC=On` to have Portable Hardware Locality (HWLOC)⁸³⁶ installed for you. Similarly, setting `HPX_WITH_FETCH_BOOST=On` during configuration time will install the necessary Boost⁸³⁷ libraries (currently V1.84.0).
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- The collective operations APIs have seen an unification, we have fixed issues and performance problems for the collectives.
- The HPX executors have seen a streamlining and some consistency changes. We have applied many performance improvements to the executor implementations that directly positively impact the performance of our parallel algorithms.
- We have added a new parcelport allowing to use Gasnet as a communication platform.
- We have added optimizations to various parcelports improving overall communication performance. This includes - amongst other things - send immediate optimizations and receiver-side zero-copy optimizations.
- Futures will now execute the associated task eagerly and inline on any wait operation if the task has not started running yet. This feature can be enabled using the `HPX_COROUTINES_WITH_THREAD_SCHEDULE_HINT_RUNS_AS_CHILD=On` configuration setting (which is *Off* by default).
- We have enabled using json files to supply configuration information through the command line. This feature can be enabled with the configuration option `HPX_COMMAND_LINE_HANDLING_WITH_JSON_CONFIGURATION_FILES=On`. This functionality depends on the external JSON library⁸³⁸, which can be built at configuration time by supplying `HPX_WITH_FETCH_JSON=On` to CMake⁸³⁹.
- We have applied many fixes to our CUDA, ROCm, and SYCL build environments.

Breaking changes

- The CMake⁸⁴⁰ configuration keys `SOMELIB_ROOT` (e.g., `BOOST_ROOT`) have been renamed to `Somelib_ROOT` (e.g., `Boost_ROOT`) to avoid warnings when using newer versions of CMake⁸⁴¹. Please update your scripts accordingly. For now, the old variable names are re-assigned to the new names and unset in the CMake⁸⁴² cache.

Closed issues

- Issue #6466⁸⁴³ - No access limitations to Wiki
- Issue #6461⁸⁴⁴ - handle_received_parcels may never return

HPX V1.9.1 (August 4, 2023)

General changes

This point release fixes a couple of problems reported for the V1.9.0 release. Most importantly, we fixed various occasional hanging during startup and shutdown in distributed scenarios. We also added support for zero-copy serialization on the receiving side to the TCP, MPI, and LCI parcelports. Last but not least, we have added support for Visual Studio 2019 and gcc using MINGW on Windows, and also support for gcc V13 and clang V15.

HPX headers are now made consistently named the same as their standard library counterparts, e.g. `#include <thread>` now corresponds to `#include <hpx/thread.hpp>`. This significantly simplifies porting existing standards conforming codes to HPX.

A lot of work has been done to improve and optimize our network communication layers. Primary focus of this work was on the LCI parcelport, but we have also cleaned up and improved the MPI parcelport.

Additionally, we have continued working on our documentation. The main focus here was on completing the API documentation of the most important API functions. We have started adding migration guides for people interested in moving their codes away from other, commonplace parallelization frameworks like OpenMP.

HPX V1.9.0 (May 2, 2023)

General changes

- Added RISC-V 64bit support. HPX is now compatible with RISC-V architectures which have revolutionized the HPC world.
- LCI parcelport has been optimized to transfer parcels with fewer messages and use the HPX resource partitioner for its progress thread allocation. It should generally provide better performance than before. It also removes its dependency on the MPI library.
- HPX dependency on Boost was further relaxed by replacing headers from Boost.Range, Boost.Tokenizer and Boost.Lockfree.
- Improvements took place on our parallel algorithms implementation.
- Our Senders/Receivers (P2300) integration was extended:
 - Coroutines were integrated with senders/receivers.

¹⁰⁷⁰ <https://github.com/STELLAR-GROUP/hpx/pull/6278>

¹⁰⁷¹ <https://github.com/STELLAR-GROUP/hpx/pull/6279>

¹⁰⁷² <https://github.com/STELLAR-GROUP/hpx/pull/6281>

¹⁰⁷³ <https://github.com/STELLAR-GROUP/hpx/pull/6283>

`get_completion_signatures` now works with awaitable senders. `- with_awaitable_senders` allows the passed senders to retrieve the value i.e. senders are transparently awaitable from within a coroutine. `- when_all_vector` was added.

- `sync_wait` and `sync_wait_with_variant` sender consumers were added. The user can now initiate the execution of their asynchronous pipeline by blocking the current thread that executes the `main()` function until the result is retrieved.
- The combinators for futures (a.k.a. `async_combinators`) `when_*`, `wait_*`, `wait_*_nothrow` were turned into CPOs allowing for end-user customization. For more information on the `async_combinators` refer to the documentation, https://hpx-docs.stellar-group.org/latest/html/libs/core/async_combinators/docs/index.html?highlight=combinators.
- The new datapar backend SVE allows `simd` and `par_simd` execution policies to exploit dataparalleism in the processors that have SVE vector registers like A64FX and Neoverse V1.
- The documentation for parallel algorithms, container algorithms was further improved. The Public API page was vastly enriched.
- Copy button shortkey was added at the top-right of code-blocks.
- Pragma directive that reports warnings as errors on MSVC was fixed.
- Command line argument `--hpx:loopback_network` was added to facilitate debugging with networks.
- We added an HPX-SYCL integration, allowing users to obtain HPX futures for SYCL events. This effectively enables the integration of arbitrary asynchronous SYCL operations into the HPX task graph. Bolted on top of this integration, we further added an HPX-SYCL executor for ease of use.

Breaking changes

- Stopped supporting Clang V8, the minimal version supported is now Clang V10.
- Stopped supporting gcc V8, the minimal version supported is now gcc V9.
- Stopped supporting Visual Studio 2015, the minimal version supported is now Visual Studio 2019.
- `tag_policy_tag` et.al. were re-added after HPX V1.8.1 deprecation.
- `get_chunk_size` and `processing_units_count` API is now expecting the time for one iteration as an argument.
- The list of all the namespace changes can be found here: [HPX V1.9.0 Namespace changes](#).

HPX V1.8.1 (Aug 5, 2022)

This is a bugfix release with a few minor additions and resolved problems.

General changes

This patch release adds a number of small new features and fixes a handful of problems discovered since the last release, in particular:

- A lot of work has been done to improve vectorization support for our parallel algorithms. HPX now supports using EVE - the Expressive Vector Engine as a vectorization backend.
- Added a simple average power consumption performance counter.
- Added performance counters related to the use of zero-copy chunks in the networking layer.
- More work was done towards full compatibility with the sender/receivers proposal P2300.
- Fixing sync_wait to decay the result types
- Fixed collective operations to properly avoid overlapping consecutive operations on the same communicator.

¹²⁹⁸ <https://github.com/STELLAR-GROUP/hpx/pull/5855>

- Simplified the implementation of our execution policies and added mapping functions between those.
- Fixed performance issues with our implementation of *small_vector*.
- Serialization now works with buffers of unsigned characters.
- Fixing dangling reference in serialization of non-default constructible types
- Fixed static linking on Windows.
- Fixed support for M1/MacOS based architectures.
- Fixed support for gentoo/musl.
- Fixed *hpx::counting_semaphore_var*.
- Properly check start and end bounds for *hpx::for_loop*
- A lot of changes and fixes to the documentation (see <https://hpx-docs.stellar-group.org>).

Breaking changes

- No breaking changes have been introduced.

- PR #5894¹³⁵⁸ - Fix executor_with_thread_hooks example
- PR #5890¹³⁵⁹ - Adding simple average power consumption performance counter
- PR #5889¹³⁶⁰ - Par unseq/unseq adding
- PR #5888¹³⁶¹ - Support for data-parallelism for reduce, transform reduce, transform_binary_reduce algorithms
- PR #5887¹³⁶² - Fixing dangling reference in serialization of non-default constructible types
- PR #5879¹³⁶³ - New performance counters related to zero-copy chunks.

HPX V1.8.0 (May 18, 2022)

With HPX parallel algorithms been fully adapted to C++20 the new release achieves full conformance with C++20 concurrency and parallelism facilities. HPX now supports all of the algorithms as specified by C++20. We have added support for vectorization to more of our algorithms. Much work has been done towards implementing P2300 (“std::execution”) and implementing the underlying senders/receivers facilities. Finally, The new release comes with a brand new documentation interface!

General changes

- The new documentation can now be found on our webpage: <https://hpx-docs.stellar-group.org>. This includes a completely new and user-friendly interface environment along with restructuring of certain components. The content in the “Quick start”, “Manual” and “Examples” was improved, while the “Build system” page was adapted to include necessary information for newcomers.
- With the vectorization support available in modern hardware architectures HPX now provides new data-parallel vector execution policies `hpx::execution::simd` and `hpx::execution::par_simd` that enable significant speed-up of our parallel algorithm implementations. The following algorithms now support SIMD execution:
 - `copy`, `copy_n`
 - `generate`
 - `adjacent_difference`, `adjacent_find`
 - `all_of`, `any_of`, `none_of`
 - `equal`, `mismatch`,
 - `inner_product`
 - `count`, `count_if`
 - `fill`, `fill_n`
 - `find`, `find_end`, `find_first_of`, `find_if`, `find_if_not`
 - `for_each`, `for_each_n`
 - `generate`, `generate_n`.

¹³⁵⁷ <https://github.com/STELLAR-GROUP/hpx/pull/5895>

¹³⁵⁸ <https://github.com/STELLAR-GROUP/hpx/pull/5894>

¹³⁵⁹ <https://github.com/STELLAR-GROUP/hpx/pull/5890>

¹³⁶⁰ <https://github.com/STELLAR-GROUP/hpx/pull/5889>

¹³⁶¹ <https://github.com/STELLAR-GROUP/hpx/pull/5888>

¹³⁶² <https://github.com/STELLAR-GROUP/hpx/pull/5887>

¹³⁶³ <https://github.com/STELLAR-GROUP/hpx/pull/5879>

- Based on top of P2300 the HPX parallel algorithms now support the pipeline syntax towards an effort to unify their usage along with senders/receivers. The HPX parallel algorithms can now bind with senders/receivers using the pipeline operator.
- Several changes took place on the executors provided by HPX:
- The executors now support the `num_cores` options in order for the user to be able to specify the desired number of cores to be used in the corresponding execution.
- The `scheduler` executor was implemented on top of senders/receivers and can be used with all HPX facilities that schedule new work, such as parallel algorithms, `hpx::async`, `hpx::dataflow`, etc.
- The performance of `fork_join_executor` was improved.
- The following algorithms have been added/adapted to be C++20 conformant:
 - `min_element`
 - `max_element`
 - `minmax_element`
 - `starts_with`
 - `ends_with`
 - `swap_ranges`
 - `unique`
 - `unique_copy`
 - `rotate`
 - `rotate_copy`
 - `sort`
 - `shift_left`
 - `shift_right`
 - `stable_sort`
 - `partition`
 - `partition_copy`
 - `stable_partition`
 - `adjacent_difference`
 - `nth_element`
 - `partial_sort`
 - `partial_sort_copy`.
- HPX_FORWARD/HPX_MOVE macros were introduced that replaced the `std::move` and `std::forward` facilities that in the library code.
- Hangs on distributed barrier were fixed.
- The performance of `scan_partitioner` was improved.
- Support was added for `thread_priority` to the `parallel_execution_policy`

- Regarding senders/receivers and the P2300 proposal various actions took place. `stop_token` was adapted to the recent proposal version (`in_place_stop_token` was introduced). Also hint, annotation, priority and stacksize properties were added to the scheduler executor. Stop support was added to `when_all`. Support for completion signatures was added. The following schedulers and algorithms were added:

- `get_completion_scheduler`
 - `any_sender` and `unique_any_sender`
 - `split` sender
 - `transform_mpi` sender
 - `transfer` sender
 - `let_error`, `let_stopped`
 - `get_env` and related environment queries
 - `schedule`, `set_value`, `set_error`, `set_done`, `start` and `connect` are now proper customization points as defined in P2300.

- Several namespaces were altered towards conformance with C++20. Compatibility layers have been added and the old versions will be removed in next releases. The namespace changes are the following:

- `hpx::parallel::induction/reduction` were moved into namespace `hpx::experimental`
 - `for_loop` and friends were moved into namespace `hpx::experimental`.
 - `hpx::util::optional` and friends were moved into namespace `hpx`.
 - `hpx::lcos::barrier` has been moved into the `hpx::distributed` namespace and `hpx::lcos::local::cpp20_barrier` has been renamed to `barrier` and moved into the `hpx` namespace.
 - `hpx::lcos::latch` has been moved into the `hpx::distributed` namespace and `lcos::local::latch` has been moved into the `hpx` namespace. The `count_down_and_wait()` functionality of `latch` has been renamed to `arrive_and_wait()`.
 - `hpx::util::unique_function_nonser` has been renamed to `hpx::move_only_function`.
 - `hpx::util::unique_function` has been renamed to `hpx::distributed::move_only_function`.
 - `hpx::util::function` has been renamed to `hpx::distributed::function`.
 - `hpx::util::function_nonser` has been renamed to `hpx::function`.
 - `hpx::util::function_ref` have been moved to namespace `hpx`.
 - `hpx::lcos::split_future` changed namespace and is now used as `hpx::split_future`.
 - `hpx::lcos::local::counting_semaphore` has been deprecated and `hpx::lcos::local::cpp20_counting_semaphore` has been renamed to `hpx::counting_semaphore`.
 - `hpx::lcos::local::cpp20_binary_semaphore` has been renamed to `hpx::binary_semaphore`.
 - `hpx::lcos::local::sliding_semaphore` has been renamed to `hpx::sliding_semaphore` and `hpx::lcos::local::sliding_semaphore_var` has been renamed to `hpx::sliding_semaphore_var`.
 - `hpx::lcos::local::spinlock` has been renamed to `hpx::spinlock`.
 - `hpx::lcos::local::mutex` has been renamed to `hpx::mutex`.
 - `hpx::lcos::local::timed_mutex` has been renamed to `hpx::timed_mutex`.

- `hpx::lcos::local::no_mutex` has been renamed to `hpx::no_mutex`.
 - `hpx::lcos::local::recursive_mutex` has been renamed to `hpx::recursive_mutex`.
 - `hpx::lcos::local::shared_mutex` has been renamed to `hpx::shared_mutex`.
 - `hpx::lcos::local::upgrade_lock` has been renamed to `hpx::upgrade_lock`.
 - `hpx::lcos::local::upgrade_to_unique_lock` has been renamed to `hpx::upgrade_to_unique_lock`.
 - `hpx::lcos::local::condition_variable` has been renamed to `hpx::condition_variable`.
`hpx::lcos::local::condition_variable_var` has been renamed to `hpx::condition_variable_var`.
 - `hpx::lcos::local::once_flag` has been renamed to `hpx::once_flag`, and
`hpx::lcos::local::call_once` has been renamed to `hpx::call_once`.
- The new LCI (Lightweight Communication Interface) parcelport was added that supports irregular and asynchronous applications like graph analysis, sparse linear algebra, modern parallel architectures etc. Major features include:
 - Support for advanced communication primitives like two sided send/recv and one sided remote put.
 - Better multi-threaded performance.
 - Explicit user control of communication resource.
 - Flexible signaling mechanisms (synchronizer, completion queue, active message handler).
 - The following CMake flags were added, mostly to support using HPX as a backend for SHAD (<https://github.com/pnnl/SHAD>). Please note that these options enable questionable functionalities, partially they even enable undefined behavior. Please only use any of them if you know what you're doing:
 - `HPX_SERIALIZATION_WITH_ALLOW_RAW_POINTER_SERIALIZATION`
 - `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`
 - `HPX_SERIALIZATION_WITH_ALLOW_CONST_TUPLE_MEMBERS`

Breaking changes

- Minimum required C++ standard library is C++17.
- Support for GCC 7 and Clang 8.0.0 and below has been removed.
- CUDA version required updated to 11.4.
- CMake version required updated to 3.18.
- The default version of Asio used was updated to 1.20.0.
- The default version of APEX used was updated to 2.5.1.
- APEX version was updated to 2.5.1.
- `tagged_pair` and `tagged_tuple` were removed.
- `tag_dispatch` was renamed to `tag_invoke`.
- `hpx.max_backgroud_threads` was renamed to `hpx.parcel.max_background_threads`.
- The following CMake flags were removed after being deprecated for at least two releases:
 - `HPX_SCHEDULER_MAX_TERMINATED_THREADS`

- HPX_WITH_GOOGLE_PERFTOOLS
- HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY
- HPX_HAVE_{COROUTINE,PLUGIN}_GCC_HIDDEN_VISIBILITY
- HPX_TOP_LEVEL
- HPX_WITH_COMPUTE_CUDA
- HPX_WITH_ASYNC_CUDA
- `annotate_function` was renamed to `scoped_annotation`.
- `execution::transform` was renamed to `execution::then`.
- `execution::detach` was renamed to `execution::start_detached`.
- `execution::on_sender` was renamed to `execution::schedule_on`.
- `execution::just_on` was renamed to `execution::just_transfer`.
- `execution::set_done` was renamed to `execution::set_stopped`.

Closed issues

- Issue #5871¹³⁶⁴ - distributed::channel.register_as terminates the active task.
- Issue #5856¹³⁶⁵ - Performance counters do not compile

HPX V1.7.1 (Aug 12, 2021)

This is a bugfix release with a few minor fixes.

General changes

- Added a CMake option to assume that all types are bitwise serializable by default: `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`. The default value `OFF` corresponds to the old behaviour.
- Added a version check for Asio. The minimum Asio version supported by *HPX* is 1.12.0.
- Fixed a bug affecting usage of actions, where the internals of *HPX* relied on function addresses being unique. This was fixed by relying on variable addresses being unique instead.
- Made `hpx::util::bind` more strict in checking the validity of placeholders.
- Small performance improvement to spinlocks.
- Adapted the following parallel algorithms to C++20: `inclusive_scan`, `exclusive_scan`, `transform_inclusive_scan`, `transform_exclusive_scan`.

Breaking changes

- The experimental `hpx::execution::simdpar` execution policy (introduced in 1.7.0) was renamed to `hpx::execution::par_simd` for consistency with the other parallel policies.

HPX V1.7.0 (Jul 14, 2021)

This release is again focused on C++20 conformance of algorithms. Additionally, many new experimental sender-based algorithms have been added based on the latest proposals.

¹⁷⁶⁴ <https://github.com/STELLAR-GROUP/hpx/pull/5440>

¹⁷⁶⁵ <https://github.com/STELLAR-GROUP/hpx/pull/5439>

¹⁷⁶⁶ <https://github.com/STELLAR-GROUP/hpx/pull/5436>

General changes

- The following algorithms have been adapted to be C++20 conformant:
 - `remove`,
 - `remove_if`,
 - `remove_copy`,
 - `remove_copy_if`,
 - `replace`,
 - `replace_if`,
 - `reverse`, and
 - `lexicographical_compare`.
- When the compiler and standard library support the standard execution policies `std::execution::seq`, `std::execution::par`, and `std::execution::par_unseq` they can now be used in all *HPX* parallel algorithms with equivalent behaviour to the non-task policies `hpx::execution::seq`, `hpx::execution::par`, and `hpx::execution::par_unseq`.
- Vc support has been fixed, after being broken in 1.6.0. In addition, *HPX* now experimentally supports GCC’s SIMD implementation, when available. The implementation can be used through the `hpx::execution::simd` and `hpx::execution::simdpar` execution policies.
- The customization points `sync_execute`, `async_execute`, `then_execute`, `post`, `bulk_sync_execute`, `bulk_async_execute`, and `bulk_then_execute` are now implemented using `tag_dispatch` (previously `tag_invoke`). Executors can still be implemented by providing the aforementioned functions as member functions of an executor.
- New functionality, enhancements, and fixes based on P0443r14 (executors proposal) and P1897 (sender-based algorithms) have been added to the `hpx::execution::experimental` namespace. These can be accessed through the `hpx/execution.hpp` and `hpx/local/execution.hpp` headers. In particular, the following sender-based algorithms have been added:
 - `detach`,
 - `ensure_started`,
 - `just`,
 - `just_on`,
 - `let_error`,
 - `let_value`,
 - `on`,
 - `transform`, and
 - `when_all`.

Additionally, futures now implement the sender concept. `make_future` can be used to turn a sender into a future. All functionality is experimental and can change without notice.

- All `hpx::init` and `hpx::start` overloads now take `std::functions` instead of `hpx::util::function_nonsr`. No changes should be required in user code to accommodate this change.

- `hpx::util::unwrapping` and other related unwrapping functionality has been moved up into the `hpx` namespace. Names in `hpx::util` are still usable with a deprecation warning. This functionality can now be accessed through the `hpx/unwrap.hpp` and `hpx/local/unwrap.hpp` headers.
- The default tag for APEX has been update from 2.3.1 to 2.4.0. In particular, this fixes a bug which could lead to hangs in distributed runs.
- The dependency on Boost.Asio has been replaced with the standalone Asio available at <https://github.com/chriskohlhoff/asio>. By default, a system-installed Asio will be used. `ASIO_ROOT` can be given as a hint to tell CMake where to find Asio. Alternatively, Asio can be fetched automatically using CMake's `fetchcontent` by setting `HPX_WITH_FETCH_ASIO=ON`. In general, dependencies on Boost have again been reduced.
- Modularization of the library has continued. In this release almost all functionality has been moved into modules. These changes do not generally affect user code. Warnings are still issued for headers that have moved.
- `hipBLAS` is now optional when compiling with `hipcc`. A warning instead of an error will be printed if `hipBLAS` is not found during configuration.
- Previously `HPX_COMPUTE_HOST_CODE` was defined in host code only if HPX was configured with CUDA or HIP. In this release `HPX_COMPUTE_HOST_CODE` is always defined in host code.
- An experimental `HPX_WITH_PRECOMPILED_HEADERS` CMake option has been added to use precompiled headers when building `HPX`. This option should not be used on Windows.
- Numerous bug fixes.

Breaking changes

- The minimum required CMake version is now 3.17.
- The minimum required Boost version is now 1.71.0.
- The customization mechanism used to implement and extend sender functionality and algorithms has been renamed from `tag_invoke` to `tag_dispatch`. All customization of sender functionality should be done by overloading `tag_dispatch`.
- The following compatibility options have been removed, along with their compatibility implementations:
 - `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`
 - `HPX_WITH_ACTION_BASE_COMPATIBILITY`
 - `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`
 - `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`
 - `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`
 - `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`
 - `HPX_WITH_REGISTER_THREAD_OVERLOADS_COMPATIBILITY`
 - `HPX_WITH_THREAD_AWARE_TIMER_COMPATIBILITY`
 - `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`
 - `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`
- The `HPX_WITH_THREAD_SCHEDULERS` CMake option has been removed. All schedulers are now enabled when possible.
- `HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY` has been turned off by default.

Closed issues

- PR #5413¹⁸¹⁰ - Fixing sender/receiver code base to compile with MSVC
- PR #5407¹⁸¹¹ - Handle exceptions thrown during initialization of parcel handler
- PR #5406¹⁸¹² - Simplify dispatching to annotation handlers
- PR #5405¹⁸¹³ - Fetch Asio automatically in perftests CI
- PR #5403¹⁸¹⁴ - Create generic executor that adds annotations to any other executor
- PR #5402¹⁸¹⁵ - Adapt `uninitialized_fill` and `uninitialized_fill_n` to C++ 20
- PR #5401¹⁸¹⁶ - Modernize a variety of facilities related to parallel algorithms
- PR #5400¹⁸¹⁷ - Fix sliding semaphore test
- PR #5399¹⁸¹⁸ - Rename leftover `tagFallbackInvoke` to `tagFallbackDispatch`
- PR #5398¹⁸¹⁹ - Improve logging in AGAS symbol namespace
- PR #5396¹⁸²⁰ - Introduce compatibility layer for collective operations
- PR #5394¹⁸²¹ - Enable OTF2 in APEX CI configuration
- PR #5393¹⁸²² - Update APEX tag
- PR #5392¹⁸²³ - Fixing wrong usage of `std::forward`
- PR #5391¹⁸²⁴ - Fix forwarding in `transform_receiver` constructor
- PR #5390¹⁸²⁵ - Make sure shared priority scheduler steals tasks on the current NUMA domain when (core) stealing is enabled
- PR #5389¹⁸²⁶ - Adapt `uninitialized_move` and `uninitialized_move_n` to C++ 20
- PR #5388¹⁸²⁷ - Fixing `gather_there` for used with lvalue reference argument
- PR #5387¹⁸²⁸ - Extend thread state logging and change default stealing parameters
- PR #5386¹⁸²⁹ - Attempt to fix the startup hang with nodes > 32
- PR #5384¹⁸³⁰ - Remove HPX 1.5.0 deprecations
- PR #5382¹⁸³¹ - Prefer installed Asio before considering `FetchContent`
- PR #5379¹⁸³² - Allow using pre-downloaded (not installed) versions of Asio and/or Apex

- PR #5376¹⁸³³ - Remove unnecessary explicit listing of library modules.rst files in CMakeLists.txt
- PR #5375¹⁸³⁴ - Slight performance improvement for `hpx::copy` and `hpx::move` et.al.
- PR #5374¹⁸³⁵ - Remove unnecessary moves from future sender implementations
- PR #5373¹⁸³⁶ - More changes to clang-cuda Jenkins configuration
- PR #5372¹⁸³⁷ - Slight improvements to `min/max/minmax_element` algorithms
- PR #5371¹⁸³⁸ - Adapt `uninitialized_copy` and `uninitialized_copy_n` to C++ 20
- PR #5370¹⁸³⁹ - Decay types in `just_sender value_types` to match stored types
- PR #5367¹⁸⁴⁰ - Disable `pkgconfig` by default again on macOS
- PR #5365¹⁸⁴¹ - Use `ccache` for Jenkins builds on Piz Daint
- PR #5363¹⁸⁴² - Update cudatoolkit module name in clang-cuda Jenkins configuration
- PR #5362¹⁸⁴³ - Adding `channel_communicator`
- PR #5361¹⁸⁴⁴ - Fix compilation with MPI enabled
- PR #5360¹⁸⁴⁵ - Update APEX and asio tags
- PR #5359¹⁸⁴⁶ - Fix check for pu-step in single-core case
- PR #5357¹⁸⁴⁷ - Making sure collective operations can be reused by preallocating communicator
- PR #5356¹⁸⁴⁸ - Update API documentation
- PR #5355¹⁸⁴⁹ - Make the `sequenced_executor processing_units_count` member function const
- PR #5354¹⁸⁵⁰ - Making sure `default_stack_size` is defined whenever declared
- PR #5353¹⁸⁵¹ - Add CUDA timestamp support to HPX Hardware Clock
- PR #5352¹⁸⁵² - Adding missing includes
- PR #5351¹⁸⁵³ - Adding `enable_logging/disable_logging` API functions
- PR #5350¹⁸⁵⁴ - Adapt lexicographical_compare to C++20
- PR #5349¹⁸⁵⁵ - Update minimum boost version needed on the docs

- PR #5348¹⁸⁵⁶ - Rename `tag_invoke` and related facilities to `tag_dispatch`
- PR #5347¹⁸⁵⁷ - Remove `make_` prefix for executor properties
- PR #5346¹⁸⁵⁸ - Remove and disable compatibility options for 1.7.0
- PR #5343¹⁸⁵⁹ - Fix `timed_executor` static cast conversion
- PR #5342¹⁸⁶⁰ - Refactor CUDA event polling
- PR #5341¹⁸⁶¹ - Adding `make_with_annotation` and `get_annotation` properties
- PR #5339¹⁸⁶² - Making sure `hpx::util::hardware::timestamp()` is always defined
- PR #5338¹⁸⁶³ - Fixing `timed_executor` specializations of customization points
- PR #5335¹⁸⁶⁴ - Make `partial_algorithm` work with any number of arguments
- PR #5334¹⁸⁶⁵ - Follow up `iter_sent` include on #5225
- PR #5332¹⁸⁶⁶ - Simplify `tag_invoke` and friends
- PR #5331¹⁸⁶⁷ - More work on cleaning up executor CPOs
- PR #5330¹⁸⁶⁸ - Add option to disable pkgconfig generation
- PR #5328¹⁸⁶⁹ - Adapt data parallel support using std-simd
- PR #5327¹⁸⁷⁰ - Fix missing `ifdef HPX_SMT_PAUSE`
- PR #5326¹⁸⁷¹ - Adding `resize()` to `serialize_buffer` allowing to shrink its size
- PR #5324¹⁸⁷² - Add get member functions to `async_rw_mutex` proxy objects for explicitly getting the wrapped value
- PR #5323¹⁸⁷³ - Add `keep_future` algorithm
- PR #5322¹⁸⁷⁴ - Replace executor customization point implementations with `tag_invoke`
- PR #5321¹⁸⁷⁵ - Separate segmented algorithms for reduce
- PR #5320¹⁸⁷⁶ - Fix `is_sender` trait and other small fixes to p0443 traits
- PR #5319¹⁸⁷⁷ - gcc 11.1 c++20 build fixes
- PR #5318¹⁸⁷⁸ - Make hipblas dependency optional as not always available

HPX V1.6.0 (Feb 17, 2021)

General changes

This release continues the focus on C++20 conformance with multiple new algorithms adapted to be C++20 conformant and becoming customization point objects (CPOs). We have also added experimental support for HIP, allowing previous CUDA features to now be compiled with hipcc and run on AMD GPUs.

- The following algorithms have been adapted to be C++20 conformant: `adjacent_find`, `includes`, `inplace_merge`, `is_heap`, `is_heap_until`, `is_partitioned`, `is_sorted`, `is_sorted_until`, `merge`, `set_difference`, `set_intersection`, `set_symmetric_difference`, `set_union`.
- Experimental HIP support can be enabled by compiling *HPX* with `hipcc`. All CUDA functionality in *HPX* can now be used with HIP. The HIP functionality is for the time being exposed through the same API as the CUDA functionality, i.e. no changes are required in user code. The CUDA, and now HIP, functionality is in the `hpx::cuda` namespace.
- We have added `partial_sort` based on Francisco Tapia's implementation.
- `hpx::init` and `hpx::start` gained new overloads taking an `hpx::init_params` struct in 1.5.0. All overloads not taking an `hpx::init_params` are now deprecated.
- We have added an experimental `fork_join_executor`. This executor can be used for OpenMP-style fork-join parallelism, where the latency of a parallel region is important for performance.
- The `parallel_executor` now uses a hierarchical spawning scheme for bulk execution, which improves data locality and performance.
- `hpx::dataflow` can now be used with executors that inject additional parameters into the call of the user-provided function.
- We have added experimental support for properties as proposed in P2220²⁰¹³. Currently the only supported property is the scheduling hint on `parallel_executor`.
- `hpx::util::annotated_function` can now be passed a dynamically generated `std::string`.
- In moving functionality to new namespaces, old names have been deprecated. A deprecation warning will be issued if you are using deprecated functionality, with instructions on how to correct or ignore the warning.
- We have removed all support for C and Fortran from our build system.
- We have further reduced the use of Boost types within *HPX* (`boost::system::error_code` and `boost::detail::spinlock`).
- We have enabled more warnings in our CI builds (unused variables and unused typedefs).

Breaking changes

- `hpxMP` support has been completely removed.
- The `verbs` `parcelport` has been removed.
- The following compatibility options have been disabled by default: `HPX_WITH_ACTION_BASE_COMPATIBILITY`, `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`, `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`, `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`, `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`, `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`, `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`, `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`, `HPX_THREAD_AWARE_TIMER_COMPATIBILITY`, `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`. Unless noted here, the above functionalities do not come

²⁰¹³ <https://wg21.link/p2220>

with replacements. Unscoped enumerations have been replaced by scoped enumerations. Previously deprecated unscoped enumerations are disabled by `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`. Newly deprecated unscoped enumerations have been given deprecation warnings and replaced by scoped enumerations. `hpx::promise` has been replaced with `hpx::distributed::promise`. `hpx::program_options` is a drop-in replacement for `boost::program_options`. `hpx::execution::parallel_executor` now has constructors which take a thread pool, covering the use case of `hpx::threads::executors::pool_executor`. A pool can be supplied with `hpx::resource::get_thread_pool`.

Closed issues

- Issue #5148²⁰¹⁴ - `runtime_support.hpp` does not work with newer clang
- Issue #5147²⁰¹⁵ - Wrong results with parallel reduce
- Issue #5129²⁰¹⁶ - Missing specialization for `std::hash<hpx::thread::id>`
- Issue #5126²⁰¹⁷ - Use `std::string` for task annotations
- Issue #5115²⁰¹⁸ - Don't expect hwloc to always report Cores
- Issue #5113²⁰¹⁹ - Handle threadmanager exceptions during startup
- Issue #5112²⁰²⁰ - libatomic problems causing unexpected fails
- Issue #5089²⁰²¹ - Remove non-BSL files
- Issue #5088²⁰²² - Unwrapping problem
- Issue #5087²⁰²³ - Remove hpxMP support
- Issue #5077²⁰²⁴ - PAPI counters are not accessible when HPX is installed
- Issue #5075²⁰²⁵ - Make the structs in all `iter_sent.hpp` lower case
- Issue #5067²⁰²⁶ - Bug `string_util/split.hpp`
- Issue #5049²⁰²⁷ - Change back the hipcc jenkins config to the fury partition on rostam
- Issue #5038²⁰²⁸ - Not all examples link in the latest HPX master
- Issue #5035²⁰²⁹ - Build with `HPX_WITH_EXAMPLES` fails
- Issue #5019²⁰³⁰ - Broken help string for hpx
- Issue #5016²⁰³¹ - `hpx::parallel::fill` fails compiling

HPX V1.5.1 (Sep 30, 2020)

General changes

This is a patch release. It contains the following changes:

- Remove restriction on suspending runtime with multiple localities, users are now responsible for synchronizing work between localities before suspending.
- Fixes several compilation problems and warnings.
- Adds notes in the documentation explaining how to cite HPX.

Closed issues

- Issue #4971²¹⁸⁸ - Parallel sort fails to compile with C++20
- Issue #4950²¹⁸⁹ - Build with *HPX_WITH_PARCELPORT_ACTION_COUNTERS ON* fails
- Issue #4940²¹⁹⁰ - Codespell report for “HPX” (on fossies.org)
- Issue #4937²¹⁹¹ - Allow suspension of runtime for multiple localities

Closed pull requests

- PR #4982²¹⁹² - Add page about citing HPX to documentation
- PR #4981²¹⁹³ - Adding the missing include
- PR #4974²¹⁹⁴ - Remove leftover format export hack
- PR #4972²¹⁹⁵ - Removing use of `get_temporary_buffer` and `return_temporary_buffer`
- PR #4963²¹⁹⁶ - Renaming files to avoid warnings from the vs build system
- PR #4951²¹⁹⁷ - Fixing build if `HPX_WITH_PARCELPORT_ACTION_COUNTERS=On`
- PR #4946²¹⁹⁸ - Allow suspension on multiple localities
- PR #4944²¹⁹⁹ - Fix typos reported by fossies codespell report
- PR #4941²²⁰⁰ - Adding some explanation to README about how to cite HPX
- PR #4939²²⁰¹ - Small changes

HPX V1.5.0 (Sep 02, 2020)

General changes

The main focus of this release is on APIs and C++20 conformance. We have added many new C++20 features and adapted multiple algorithms to be fully C++20 conformant. As part of the modularization we have begun specifying the public API of *HPX* in terms of headers and functionality, and aligning it more closely to the C++ standard. All non-distributed modules are now in place, along with an experimental option to completely disable distributed features in *HPX*. We have also added experimental asynchronous MPI and CUDA executors. Lastly this release introduces CMake targets for depending projects, performance improvements, and many bug fixes.

- We have added the C++20 features `hpx::jthread` and `hpx::stop_token`. `hpx::condition_variable_any` now exposes new functions supporting `hpx::stop_token`.
- We have added `hpx::stable_sort` based on Francisco Tapia's implementation.
- We have adapted existing synchronization primitives to be fully conformant C++20: `hpx::barrier`, `hpx::latch`, `hpx::counting_semaphore`, and `hpx::binary_semaphore`.
- We have started using customization point objects (CPOs) to make the corresponding algorithms fully conformant to C++20 as well as to make algorithm extension easier for the user. `all_of/any_of/none_of`, `copy`, `count`, `destroy`, `equal`, `fill`, `find`, `for_each`, `generate`, `mismatch`, `move`, `reduce`, `transform_reduce` are using those CPOs (all in namespace `hpx`). We also have adapted their corresponding `hpx::ranges` versions to be conforming to C++20 in this release.
- We have adapted support for `co_await` to C++20, in addition to `hpx::future` it now also supports `hpx::shared_future`. We have also added allocator support for futures returned by `co_return`. It is no longer in the `experimental` namespace.
- We added serialization support for `std::variant` and `std::tuple`.
- `result_of` and `is_callable` are now deprecated and replaced by `invoke_result` and `is_invocable` to conform to C++20.
- We continued with the modularization, making it easier for us to add the new experimental `HPX_WITH_DISTRIBUTED_RUNTIME` CMake option (see below). A significant amount of headers have been deprecated. We adapted the namespaces and headers we could to be closer to the standard ones (*Public API*). Depending code should still compile, however warnings are now generated instructing to change the include statements accordingly.
- It is now possible to have a basic CUDA support including a helper function to get a future from a CUDA stream and target handling. They are available under the `hpx::cuda::experimental` namespace and they can be enabled with the `-DHPX_WITH_ASYNC_CUDA=ON` CMake option.
- We added a new `hpx::mpi::experimental` namespace for getting futures from an asynchronous MPI call and a new minimal MPI executor `hpx::mpi::experimental::executor`. These can be enabled with the `-DHPX_WITH_ASYNC_MPI=On` CMake option.
- A polymorphic executor has been implemented to reduce compile times as a function accepting executors can potentially be instantiated only once instead of multiple times with different executors. It accepts the function signature as a template argument. It needs to be constructed from any other executor. Please note, that the function signatures that can be scheduled using `then_execute`, `bulk_sync_execute`, `bulk_async_execute` and `bulk_then_execute` are slightly different (See the comment in PR #4514²²⁰² for more details).
- The underlying executor of `block_executor` has been updated to a newer one.
- We have added a parameter to `auto_chunk_size` to control the amount of iterations to measure.

²²⁰² <https://github.com/STELLAR-GROUP/hpx/pull/4514>

- All executor parameter hooks can now be exposed through the executor itself. This will allow to deprecate the `.with()` functionality on execution policies in the future. This is also a first step towards simplifying our executor APIs in preparation for the upcoming C++23 executors (senders/receivers).
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`. Please note this is a breaking change without backwards-compatibility option. We have converted all of those APIs to be based on customization point objects. Two new executors have been added to enable easy integration of the existing resiliency features with other facilities (like the parallel algorithms): `replay_executor` and `replicate_executor`.
- We have added performance counters type information (aggregating, monotonically increasing, average count, average timer, etc.).
- HPX threads are now re-scheduled on the same worker thread they were suspended on to avoid cache misses from moving from one thread to the other. This behavior doesn't prevent the thread from being stolen, however.
- We have added a new configuration option `hpx.exception_verbosity` to allow to control the level of verbosity of the exceptions (3 levels available).
- `broadcast_to`, `broadcast_from`, `scatter_to` and `scatter_from` have been added to the collectives, modernization of `gather_here` and `gather_there` with futures taken by rvalue references. See the breaking change on `all_to_all` in the next section. None of the collectives need supporting macros anymore (e.g. specifying the data types used for a collective operation using `HPX_REGISTER_ALLGATHER` and similar is not needed anymore).
- New API functions have been added: a) to get the number of cores which are idle (`hpx::get_idle_core_count`) and b) returning a bitmask representing the currently idle cores (`hpx::get_idle_core_mask`).
- We have added an experimental option to only enable the local runtime, you can disable the distributed runtime with `HPX_WITH_DISTRIBUTED_RUNTIME=OFF`. You can also enable the local runtime by using the `--hpx:local` runtime option.
- We fixed task annotations for actions.
- The alias `hpx::promise` to `hpx::lcos::promise` is now deprecated. You can use `hpx::lcos::promise` directly instead. `hpx::promise` will refer to the local-only promise in the future.
- We have added a `prepare_checkpoint` API function that calculates the amount of necessary buffer space for a particular set of arguments checkpointed.
- We have added `hpx::upgrade_lock` and `hpx::upgrade_to_unique_lock`, which make `hpx::shared_mutex` (and similar) usable in more flexible ways.
- We have changed the CMake targets exposed to the user, it now includes `HPX::hpx`, `HPX::wrap_main` (`int main` as the first `HPX` thread of the application, see [Starting the HPX runtime](#)), `HPX::plugin`, `HPX::component`. The CMake variables `HPX_INCLUDE_DIRS` and `HPX_LIBRARIES` are deprecated and will be removed in a future release, you should now link directly to the `HPX::hpx` CMake target.
- A new example is demonstrating how to create and use a wrapping executor (`quickstart/executor_with_thread_hooks.cpp`)
- A new example is demonstrating how to disable thread stealing during the execution of parallel algorithms (`quickstart/disable_thread_stealing_executor.cpp`)
- We now require for our CMake build system configuration files to be formatted using `cmake-format`.
- We have removed more dependencies on various Boost libraries.
- We have added an experimental option enabling unity builds of HPX using the `-DHPX_WITH_UNITY_BUILD=On` CMake option.
- Many bug fixes.

Breaking changes

- HPX now requires a C++14 capable compiler. We have set the HPX C++ standard automatically to C++14 and if it needs to be set explicitly, it should be specified through the CMAKE_CXX_STANDARD setting as mandated by CMake. The HPX_WITH_CXX* variables are now deprecated and will be removed in the future.
- Building and using HPX is now supported only when using CMake V3.13 or later, Boost V1.64 or newer, and when compiling with clang V5, gcc V7, or VS2019, or later. Other compilers might still work but have not been tested thoroughly.
- We have added a `hpx::init_params` struct to pass parameters for HPX initialization e.g. the resource partitioner callback to initialize thread pools ([Using the resource partitioner](#)).
- The `all_to_all` algorithm is renamed to `all_gather`, and the new `all_to_all` algorithm is not compatible with the old one.
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`.

HPX V1.4.1 (Feb 12, 2020)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation issues on Windows, macOS, FreeBSD, and with gcc 10
- Install missing pdb files on Windows
- Allow running tests using an installed version of *HPX*
- Skip MPI finalization if HPX has not initialized MPI
- Give a hard error when attempting to use IO counters on Windows

Closed issues

- Issue #4320²⁷⁰¹ - HPX 1.4.0 does not compile with gcc 10
- Issue #4336²⁷⁰² - Building HPX 1.4.0 with IO Counters breaks (Windows)
- Issue #4334²⁷⁰³ - HPX Debug and RelWithDebInfo builds on Windows not installing .pdb files
- Issue #4322²⁷⁰⁴ - Undefine VT1 and VT2 after boost includes
- Issue #4314²⁷⁰⁵ - Compile error on 1.4.0
- Issue #4307²⁷⁰⁶ - ld: error: duplicate symbol: freebsd_environ

- PR #4310²⁷¹⁴ - Remove environment handling from exception.cpp

HPX V1.4.0 (January 15, 2020)

General changes

- We have added the collectives all_to_all and all_reduce.
- We have added APIs for resiliency, which allows replication and replay for failed tasks. See the *documentation* for more details.
- Components can now be checkpointed.
- Performance improvements to schedulers and coroutines. A significant change is the addition of stackless coroutines. These are to be used for tasks that do not need to be suspended and can reduce overheads noticeably in applications with short tasks. A stackless coroutine can be created with the new stack size `thread_stacksize_nostack`.
- We have added an implementation of `unique_any`, which is a non-copyable version of `any`.
- The `shared_priority_queue_scheduler` has been improved. It now has lower overheads than the default scheduler in many situations. Unlike the default scheduler it fully supports NUMA scheduling hints. Enable it with the command line option `--hpx:queueing=shared-priority`. This scheduler should still be considered experimental, but its use is encouraged in real applications to help us make it production ready.
- We have added the performance counters `background-receive-duration` and `background-receive-overhead` for inspecting the time and overhead spent on receiving parcels in the background.
- Compilation time has been further improved when `HPX_WITH_NETWORKING=OFF`.
- We no longer require compiled Boost dependencies in certain configurations. This requires at least Boost 1.70, compiling on x86 with GCC 9, clang (libc++) 9, or VS2019 in C++17 mode. The dependency on Boost.Filesystem can explicitly be turned on with `HPX_FILESYSTEM_WITH_BOOST_FILESYSTEM_COMPATIBILITY=ON` (it is off by default if the standard library supports `std::filesystem`). Boost.ProgramOptions has been copied into the HPX repository. We have a compatibility layer for users who must explicitly use Boost.ProgramOptions instead of the ProgramOptions provided by HPX. To remove the dependency `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY` must be explicitly set to OFF. This option will be removed in a future release. We have also removed several other header-only dependencies on Boost.
- It is now possible to use the process affinity mask set by tools like numactl and various batch environments with the command line option `--hpx:use-process-mask`. Enabling this option implies `--hpx:ignore-batch-env`.
- It is now possible to create standalone thread pools without starting the runtime. See the `standalone_thread_pool_executor.cpp` test in the `execution` module for an example.

²⁷¹¹ <https://github.com/STELLAR-GROUP/hpx/pull/4337>

²⁷¹² <https://github.com/STELLAR-GROUP/hpx/pull/4335>

²⁷¹³ <https://github.com/STELLAR-GROUP/hpx/pull/4315>

²⁷¹⁴ <https://github.com/STELLAR-GROUP/hpx/pull/4310>

- Tasks annotated with `hpx::util::annotated_function` now have their correct name when using APEX to generate OTF2 files.
- Cloning of APEX was defective in previous releases (it required manual intervention to check out the correct tag or branch). This has been fixed.
- The option `HPX_WITH_MORE_THAN_64_THREADS` is now ignored and will be removed in a future release. The value is instead derived directly from `HPX_WITH_MAX_CPU_COUNT` option.
- We have deprecated compiling in C++11 mode. The next release will require a C++14 capable compiler.
- We have deprecated support for the Vc library. This option will be replaced with SIMD support from the standard library in a future release.
- We have significantly refactored our CMake setup. This is intended to be a non-breaking change and will allow for using HPX through CMake targets in the future.
- We have continued modularizing the HPX library. In the process we have rearranged many header files into module-specific directories. All moved headers have compatibility headers which forward from the old location to the new location, together with a deprecation warning. The compatibility headers will eventually be removed.
- We now enforce formatting with `clang-format` on the majority of our source files.
- We have added SPDX license tags to all files.
- Many bugfixes.

Breaking changes

- The `HPX_WITH_THREAD_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_UNWRAPPED_COMPATIBILITY` option and the associated compatibility layer has been removed.

Closed issues

- PR #4196²⁸³⁷ - minor fixes for building on OSX Darwin
- PR #4195²⁸³⁸ - Use full clone on CircleCI for pushing stable tag
- PR #4193²⁸³⁹ - Add scheduling hints to hello_world_distributed
- PR #4192²⁸⁴⁰ - Set up CUDA in HPXConfig.cmake
- PR #4191²⁸⁴¹ - Export allocators root variables
- PR #4190²⁸⁴² - Don't use `constexpr` in `thread_data` with GCC <= 6
- PR #4189²⁸⁴³ - Only use `quick_exit` if available
- PR #4188²⁸⁴⁴ - Google Season of Docs updates to documentation; writing single node hpx applications
- PR #4186²⁸⁴⁵ - correct vc to cuda in cuda cmake
- PR #4184²⁸⁴⁶ - Resetting some cached variables to make sure those are re-filled
- PR #4183²⁸⁴⁷ - Fix `hpxcxx` configuration
- PR #4181²⁸⁴⁸ - Rename base libraries var
- PR #4180²⁸⁴⁹ - Move header left behind earlier to plugin module
- PR #4179²⁸⁵⁰ - Moving `zip_iterator` and `transform_iterator` to iterator_support module
- PR #4178²⁸⁵¹ - Move checkpointing support to its own module
- PR #4177²⁸⁵² - Small const fix to `basic_execution` module
- PR #4176²⁸⁵³ - Add back `HPX_LIBRARIES` and friends to `HPXConfig.cmake`
- PR #4175²⁸⁵⁴ - Make Vc public and add it to `HPXConfig.cmake`
- PR #4173²⁸⁵⁵ - Wait for runtime to be running before returning from `hpx::start`
- PR #4172²⁸⁵⁶ - More protection against shutdown problems in error handling scenarios.
- PR #4171²⁸⁵⁷ - Ignore lock in `condition_variable::wait`
- PR #4170²⁸⁵⁸ - Adding APEX dependency to MPI parcelport
- PR #4168²⁸⁵⁹ - Adding utility include

- PR #3159³⁰⁸¹ - Support Checkpointing Components

HPX V1.3.0 (May 23, 2019)

General changes

- Performance improvements: the schedulers have significantly reduced overheads from removing false sharing and the parallel executor has been updated to create fewer futures.
- HPX now defaults to not turning on networking when running on one locality. This means that you can run multiple instances on the same system without adding command line options.
- Multiple issues reported by Clang sanitizers have been fixed.
- We have added (back) single-page HTML documentation and PDF documentation.
- We have started modularizing the HPX library. This is useful both for developers and users. In the long term users will be able to consume only parts of the HPX libraries if they do not require all the functionality that HPX currently provides.
- We have added an implementation of `function_ref`.

³⁰⁷⁹ <https://github.com/STELLAR-GROUP/hpx/pull/3496>

³⁰⁸⁰ <https://github.com/STELLAR-GROUP/hpx/pull/3192>

³⁰⁸¹ <https://github.com/STELLAR-GROUP/hpx/pull/3159>

- The `barrier` and `latch` classes have gained a few additional member functions.

Breaking changes

- Executable and library targets are now created without the `_exe` and `_lib` suffix respectively. For example, the target `1d_stencil_1_exe` is now simply called `1d_stencil_1`.
- We have removed the following deprecated functionality: `queue`, `scoped_unlock`, and support for input iterators in algorithms.
- We have turned off the compatibility layer for `unwrapped` by default. The functionality will be removed in the next release. The option can still be turned on using the [CMake³⁰⁸²](#) option `HPX_WITH_UNWRAPPED_SUPPORT`. Likewise, `inclusive_scan` compatibility overloads have been turned off by default. They can still be turned on with `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY`.
- The minimum compiler and dependency versions have been updated. We now support GCC from version 5 onwards, Clang from version 4 onwards, and Boost from version 1.61.0 onwards.
- The headers for preprocessor macros have moved as a result of the functionality being moved to a separate module. The old headers are deprecated and will be removed in a future version of HPX. You can turn off the warnings by setting `HPX_PREPROCESSOR_WITH_DEPRECATED_WARNINGS=OFF` or turn off the compatibility headers completely with `HPX_PREPROCESSOR_WITH_COMPATIBILITY_HEADERS=OFF`.

Closed issues

- PR #3835³¹⁶² - make all latch members protected for consistency
- PR #3834³¹⁶³ - Disable transpose_block_numa example on CircleCI
- PR #3833³¹⁶⁴ - make latch **counter** protected for deriving latch in hpxmp
- PR #3831³¹⁶⁵ - Fix CircleCI config for modules
- PR #3830³¹⁶⁶ - minor fix: option HPX_WITH_TEST was not working correctly
- PR #3828³¹⁶⁷ - Avoid for binaries that depend on HPX to directly link against internal modules
- PR #3827³¹⁶⁸ - Adding shortcut for `hpx::get_ptr<>(sync, id)` for a local, non-migratable objects
- PR #3826³¹⁶⁹ - Fix and update modules documentation
- PR #3825³¹⁷⁰ - Updating default APEX version to 2.1.3 with HPX
- PR #3823³¹⁷¹ - Fix pkgconfig libs handling
- PR #3822³¹⁷² - Change includes in `hpx_wrap.cpp` to more specific includes
- PR #3821³¹⁷³ - Disable barrier_3792 test when networking is disabled
- PR #3820³¹⁷⁴ - Assorted CMake fixes
- PR #3815³¹⁷⁵ - Removing left-over debug output
- PR #3814³¹⁷⁶ - Allow setting default scheduler mode via the configuration database
- PR #3813³¹⁷⁷ - Make the deprecation warnings issued by the old pp headers optional
- PR #3812³¹⁷⁸ - Windows requires to handle symlinks to directories differently from those linking files
- PR #3811³¹⁷⁹ - Clean up PP module and library skeleton
- PR #3806³¹⁸⁰ - Moving include path configuration to before APEX
- PR #3804³¹⁸¹ - Fix latch
- PR #3803³¹⁸² - Update hpxcxx to look at lib64 and use python3
- PR #3802³¹⁸³ - Numa binding allocator
- PR #3801³¹⁸⁴ - Remove duplicated includes

- PR #3800³¹⁸⁵ - Attempt to fix Posix context switching after lazy init changes
- PR #3798³¹⁸⁶ - count and count_if accepts different iterator types
- PR #3797³¹⁸⁷ - Adding a couple of override keywords to overloaded virtual functions
- PR #3796³¹⁸⁸ - Re-enable testing all schedulers in shutdown_suspended_test
- PR #3795³¹⁸⁹ - Change std::terminate to std::abort in SIGSEGV handler
- PR #3794³¹⁹⁰ - Fixing #3792
- PR #3793³¹⁹¹ - Extending migrate_polymorphic_component unit test
- PR #3791³¹⁹² - Change throw() to noexcept
- PR #3790³¹⁹³ - Remove deprecated options for 1.3.0 release
- PR #3789³¹⁹⁴ - Remove Boost filesystem compatibility header
- PR #3788³¹⁹⁵ - Disabled even more spots that should not execute if networking is disabled
- PR #3787³¹⁹⁶ - Bump minimal boost supported version to 1.61.0
- PR #3786³¹⁹⁷ - Bump minimum required versions for 1.3.0 release
- PR #3785³¹⁹⁸ - Explicitly set number of jobs for all ninja invocations on CircleCI
- PR #3784³¹⁹⁹ - Fix leak and address sanitizer problems
- PR #3783³²⁰⁰ - Disabled even more spots that should not execute if networking is disabled
- PR #3782³²⁰¹ - Cherry-picked tuple and thread_init_data fixes from #3701
- PR #3781³²⁰² - Fix generic context coroutines after lazy stack allocation changes
- PR #3780³²⁰³ - Rename hello world examples
- PR #3776³²⁰⁴ - Sort algorithms now use the supplied chunker to determine the required minimal chunk size
- PR #3775³²⁰⁵ - Disable Boost auto-linking
- PR #3774³²⁰⁶ - Tag and push stable builds
- PR #3773³²⁰⁷ - Enable migration of polymorphic components

- PR #3771³²⁰⁸ - Fix link to stackoverflow in documentation
- PR #3770³²⁰⁹ - Replacing constexpr if in brace-serialization code
- PR #3769³²¹⁰ - Fix SIGSEGV handler
- PR #3768³²¹¹ - Adding flags to scheduler allowing to control thread stealing and idle back-off
- PR #3767³²¹² - Fix help formatting in hpxrun.py
- PR #3765³²¹³ - Fix a couple of bugs in the thread test
- PR #3764³²¹⁴ - Workaround for SFINAE regression in msvc14.2
- PR #3762³²¹⁵ - Prevent MSVC from prematurely instantiating things
- PR #3761³²¹⁶ - Update python scripts to work with python 3
- PR #3760³²¹⁷ - Fix callable vtable for GCC4.9
- PR #3759³²¹⁸ - Rename PAGE_SIZE to PAGE_SIZE_ because AppleClang
- PR #3755³²¹⁹ - Making sure locks are not held during suspension
- PR #3754³²²⁰ - Disable more code if networking is not available/not enabled
- PR #3752³²²¹ - Move `util::format` implementation to source file
- PR #3751³²²² - Fixing problems with `lcos::barrier` and `iostreams`
- PR #3750³²²³ - Change error message to take into account `use_guard_page` setting
- PR #3749³²²⁴ - Fix lifetime problem in `run_as_hpx_thread`
- PR #3748³²²⁵ - Fixed unusable behavior of the clang code analyzer.
- PR #3747³²²⁶ - Added PMIX_RANK to the defaults of `HPX_WITH_PARCELPORT_MPI_ENV`.
- PR #3745³²²⁷ - Introduced `cache_aligned_data` and `cache_line_data` helper structure
- PR #3742³²²⁸ - Remove more unused functionality from util/logging
- PR #3740³²²⁹ - Fix includes in partitioned vector tests
- PR #3739³²³⁰ - More fixes to make sure that `std::flush` really flushes all output

- PR #3737³²³¹ - Fix potential shutdown problems
- PR #3736³²³² - Fix `guided_pool_executor` after dataflow changes caused compilation fail
- PR #3734³²³³ - Limiting executor
- PR #3732³²³⁴ - More constrained bound constructors
- PR #3730³²³⁵ - Attempt to fix deadlocks during component loading
- PR #3729³²³⁶ - Add latch member function `count_up` and `reset`, requested by hpxMP
- PR #3728³²³⁷ - Send even empty buffers on `hpx::end1` and `hpx::flush`
- PR #3727³²³⁸ - Adding example demonstrating how to customize the memory management for a component
- PR #3726³²³⁹ - Adding support for passing command line options through the `HPX_COMMANDLINE_OPTIONS` environment variable
- PR #3722³²⁴⁰ - Document known broken OpenMPI builds
- PR #3716³²⁴¹ - Add barrier reset function, requested by hpxMP for reusing barrier
- PR #3715³²⁴² - More work on functions and vtables
- PR #3714³²⁴³ - Generate single-page HTML, PDF, manpage from documentation
- PR #3713³²⁴⁴ - Updating default APEX version to 2.1.2
- PR #3712³²⁴⁵ - Update release procedure
- PR #3710³²⁴⁶ - Fix the C++11 build, after #3704
- PR #3709³²⁴⁷ - Move some component_registry functionality to source file
- PR #3708³²⁴⁸ - Ignore all locks while handling assertions
- PR #3707³²⁴⁹ - Remove obsolete hpx runtime executable
- PR #3705³²⁵⁰ - Fix and simplify `make_ready_future` overload sets
- PR #3704³²⁵¹ - Reduce use of binders
- PR #3703³²⁵² - Ini
- PR #3702³²⁵³ - Fixing CUDA compiler errors

- PR #3700³²⁵⁴ - Added barrier::increment function to increase total number of thread
- PR #3697³²⁵⁵ - One more attempt to fix migration...
- PR #3694³²⁵⁶ - Fixing component migration
- PR #3693³²⁵⁷ - Print thread state when getting disallowed value in set_thread_state
- PR #3692³²⁵⁸ - Only disable constexpr with clang-cuda, not nvcc+gcc
- PR #3691³²⁵⁹ - Link with libsupc++ if needed for thread_local
- PR #3690³²⁶⁰ - Remove thousands separators in set_operations_3442 to comply with C++11
- PR #3688³²⁶¹ - Decouple serialization from function vtables
- PR #3687³²⁶² - Fix a couple of test failures
- PR #3686³²⁶³ - Make sure tests.unit.build are run after install on CircleCI
- PR #3685³²⁶⁴ - Revise quickstart CMakeLists.txt explanation
- PR #3684³²⁶⁵ - Provide concept emulation for Ranges-TS concepts
- PR #3683³²⁶⁶ - Ignore uninitialized chunks
- PR #3682³²⁶⁷ - Ignore uninitialized chunks. Check proper indices.
- PR #3680³²⁶⁸ - Ignore uninitialized chunks. Check proper range indices
- PR #3679³²⁶⁹ - Simplify basic action implementations
- PR #3678³²⁷⁰ - Making sure HPX_HAVE_LIBATOMIC is unset before checking
- PR #3677³²⁷¹ - Fix generated full version number to be usable in expressions
- PR #3674³²⁷² - Reduce functional utilities call depth
- PR #3672³²⁷³ - Change new build system to use existing macros related to pseudo dependencies
- PR #3669³²⁷⁴ - Remove indirection in function_ref when thread description is disabled
- PR #3668³²⁷⁵ - Unbreaking async_*cb* tests
- PR #3667³²⁷⁶ - Generate version.hpp

HPX V1.2.1 (Feb 19, 2019)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation on ARM, s390x and 32-bit architectures.
- Fix a critical bug in the `future` implementation.
- Fix several problems in the CMake configuration which affects external projects.
- Add support for Boost 1.69.0.

Closed issues

- PR #3551³³⁷⁵ - Fix uint64_t causing compilation fail on i686

HPX V1.2.0 (Nov 12, 2018)

General changes

Here are some of the main highlights and changes for this release:

- Thanks to the work of our Google Summer of Code student, Nikunj Gupta, we now have a new implementation of `hpx_main.hpp` on supported platforms (Linux, BSD and MacOS). This is intended to be a less fragile drop-in replacement for the old implementation relying on preprocessor macros. The new implementation does not require changes if you are using the `CMake`³³⁷⁶ or `pkg-config`. The old behaviour can be restored by setting `HPX_WITH_DYNAMIC_HPX_MAIN=OFF` during `CMake`³³⁷⁷ configuration. The implementation on Windows is unchanged.

2.10. Releases

1657

- We have added functionality to allow passing scheduling hints to our schedulers. These will allow us to create executors that for example target a specific NUMA domain or allow for *HPX* threads to be pinned to a particular worker thread.
- We have significantly improved the performance of our futures implementation by making the shared state atomic.
- We have replaced Boostbook by Sphinx for our documentation. This means the documentation is easier to navigate with built-in search and table of contents. We have also added a quick start section and restructured the documentation to be easier to follow for new users.
- We have added a new option to the `--hpx:threads` command line option. It is now possible to use `cores` to tell *HPX* to only use one worker thread per core, unlike the existing option `all` which uses one worker thread per processing unit (processing unit can be a hyperthread if hyperthreads are available). The default value of `--hpx:threads` has also been changed to `cores` as this leads to better performance in most cases.
- All command line options can now be passed alongside configuration options when initializing *HPX*. This means that some options that were previously only available on the command line can now be set as configuration options.
- HPXMP is a portable, scalable, and flexible application programming interface using the OpenMP specification that supports multi-platform shared memory multiprocessing programming in C and C++. HPXMP can be enabled within *HPX* by setting `DHPX_WITH_HPXMP=ON` during [CMake³³⁷⁸](#) configuration.
- Two new performance counters were added for measuring the time spent doing background work. `/threads/time/background-work-duration` returns the time spent doing background on a given thread or locality, while `/threads/time/background-overhead` returns the fraction of time spent doing background work with respect to the overall time spent running the scheduler. The new performance counters are disabled by default and can be turned on by setting `HPX_WITH_BACKGROUND_THREAD_COUNTERS=ON` during [CMake³³⁷⁹](#) configuration.
- The idling behaviour of *HPX* has been tweaked to allow for faster idling. This is useful in interactive applications where the *HPX* worker threads may not have work all the time. This behaviour can be tweaked and turned off as before with `HPX_WITH_THREAD_MANAGER_IDLE_BACKOFF=OFF` during [CMake³³⁸⁰](#) configuration.
- It is now possible to register callback functions for *HPX* worker thread events. Callbacks can be registered for starting and stopping worker threads, and for when errors occur.

Breaking changes

- The implementation of `hpx_main.hpp` has changed. If you are using custom Makefiles you will need to make changes. Please see the documentation on [using Makefiles](#) for more details.
- The default value of `--hpx:threads` has changed from `all` to `cores`. The new option `cores` only starts one worker thread per core.
- We have dropped support for Boost 1.56 and 1.57. The minimal version of Boost we now test is 1.58.
- Our `boost::format`-based formatting implementation has been revised and replaced with a custom implementation. This changes the formatting syntax and requires changes if you are relying on `hpx::util::format` or `hpx::util::format_to`. The pull request for this change contains more information: [PR #3266³³⁸¹](#).
- The following deprecated options have now been completely removed:
`HPX_WITH_ASYNC_FUNCTION_COMPATIBILITY`,
`HPX_WITH_LOCAL_DATAFLOW`,
`HPX_WITH_GENERIC_EXECUTION_POLICY`,
`HPX_WITH_BOOST_CHRONO_COMPATIBILITY`,
`HPX_WITH_EXECUTOR_COMPATIBILITY`,
`HPX_WITH_EXECUTION_POLICY_COMPATIBILITY`, and
`HPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY`.

- PR #3478³⁴⁷² - Making sure the application's exit code is properly propagated back to the OS
- PR #3476³⁴⁷³ - Don't print docker credentials as part of the environment.
- PR #3473³⁴⁷⁴ - Fixing invalid cmake code if no jemalloc prefix was given
- PR #3472³⁴⁷⁵ - Attempting to work around recent clang test compilation failures
- PR #3471³⁴⁷⁶ - Enable jemalloc on windows
- PR #3470³⁴⁷⁷ - Updates readme
- PR #3468³⁴⁷⁸ - Avoid hang if there is an exception thrown during startup
- PR #3467³⁴⁷⁹ - Add compiler specific fallthrough attributes if C++17 attribute is not available
- PR #3466³⁴⁸⁰ - - bugfix : fix compilation with llvm-7.0
- PR #3465³⁴⁸¹ - This patch adds various optimizations extracted from the thread_local_allocator work
- PR #3464³⁴⁸² - Check for forked repos in CircleCI docker push step
- PR #3463³⁴⁸³ - - cmake : create the parent directory before symlinking
- PR #3459³⁴⁸⁴ - Remove unused/incomplete functionality from util/logging
- PR #3458³⁴⁸⁵ - Fix a problem with scope of CMAKE_CXX_FLAGS and hpx_add_compile_flag
- PR #3457³⁴⁸⁶ - Fixing more size_t -> int16_t (and similar) warnings
- PR #3456³⁴⁸⁷ - Add #ifdefs to topology.cpp to support old hwloc versions again
- PR #3454³⁴⁸⁸ - Fixing warnings related to silent conversion of size_t -> int16_t
- PR #3451³⁴⁸⁹ - Add examples as unit tests
- PR #3450³⁴⁹⁰ - Constexpr-fying bind and other functional facilities
- PR #3446³⁴⁹¹ - Fix some thread suspension timeouts
- PR #3445³⁴⁹² - Fix various warnings
- PR #3443³⁴⁹³ - Only enable service pool config options if pools are enabled
- PR #3441³⁴⁹⁴ - Fix missing closing brackets in documentation

- PR #3439³⁴⁹⁵ - Use correct MPI CXX libraries for MPI parcelport
- PR #3436³⁴⁹⁶ - Add projection function to find_* (and fix very bad bug)
- PR #3435³⁴⁹⁷ - Fixing 1205
- PR #3434³⁴⁹⁸ - Fix threads cores
- PR #3433³⁴⁹⁹ - Add Heise Online to release announcement list
- PR #3432³⁵⁰⁰ - Don't track task dependencies for distributed runs
- PR #3431³⁵⁰¹ - Circle CI setting changes for hpxMP
- PR #3430³⁵⁰² - Fix unused params warning
- PR #3429³⁵⁰³ - One thread per core
- PR #3428³⁵⁰⁴ - This suppresses a deprecation warning that is being issued by MSVC 19.15.26726
- PR #3427³⁵⁰⁵ - Fixes #3426
- PR #3425³⁵⁰⁶ - Use source cache and workspace between job steps on CircleCI
- PR #3421³⁵⁰⁷ - Add CDash timing output to future overhead test (for graphs)
- PR #3420³⁵⁰⁸ - Add guided_pool_executor
- PR #3419³⁵⁰⁹ - Fix typo in CircleCI config
- PR #3418³⁵¹⁰ - Add sphinx documentation
- PR #3415³⁵¹¹ - Scheduler NUMA hint and shared priority scheduler
- PR #3414³⁵¹² - Adding step to synchronize the APEX release
- PR #3413³⁵¹³ - Fixing multiple defines of APEX_HAVE_HPX
- PR #3412³⁵¹⁴ - Fixes linking with libhpx_wrap error with BSD and Windows based systems
- PR #3410³⁵¹⁵ - Fix typo in CMakeLists.txt
- PR #3409³⁵¹⁶ - Fix brackets and indentation in existing_performance_counters.qbk
- PR #3407³⁵¹⁷ - Fix unused param and extra ; warnings emitted by gcc 8.x

- PR #3406³⁵¹⁸ - Adding thread local allocator and use it for future shared states
- PR #3405³⁵¹⁹ - Adding DHPX_HAVE_THREAD_LOCAL_STORAGE=ON to builds
- PR #3404³⁵²⁰ - fixing multiple definition of main() in linux
- PR #3402³⁵²¹ - Allow debug option to be enabled only for Linux systems with dynamic main on
- PR #3401³⁵²² - Fix cuda_future_helper.h when compiling with C++11
- PR #3400³⁵²³ - Fix floating point exception scheduler_base idle backoff
- PR #3398³⁵²⁴ - Atomic future state
- PR #3397³⁵²⁵ - Fixing code for older gcc versions
- PR #3396³⁵²⁶ - Allowing to register thread event functions (start/stop/error)
- PR #3394³⁵²⁷ - Fix small mistake in primary_namespace_server.cpp
- PR #3393³⁵²⁸ - Explicitly instantiate configured schedulers
- PR #3392³⁵²⁹ - Add performance counters background overhead and background work duration
- PR #3391³⁵³⁰ - Adapt integration of HPXMP to latest build system changes
- PR #3390³⁵³¹ - Make AGAS measurements optional
- PR #3389³⁵³² - Fix deadlock during shutdown
- PR #3388³⁵³³ - Add several functionalities allowing to optimize synchronous action invocation
- PR #3387³⁵³⁴ - Add cmake option to opt out of fail-compile tests
- PR #3386³⁵³⁵ - Adding support for boost::container::small_vector to dataflow
- PR #3385³⁵³⁶ - Adds Debug option for hpx initializing from main
- PR #3384³⁵³⁷ - This hopefully fixes two tests that occasionally fail
- PR #3383³⁵³⁸ - Making sure thread local storage is enable for hpxMP
- PR #3382³⁵³⁹ - Fix usage of HPX_CAPTURE together with default value capture [=]
- PR #3381³⁵⁴⁰ - Replace undefined instantiations of uniform_int_distribution

- PR #3380³⁵⁴¹ - Add missing semicolons to uses of HPX_COMPILER_FENCE
- PR #3379³⁵⁴² - Fixing #3378
- PR #3377³⁵⁴³ - Adding build system support to integrate hpxmp into hpx at the user's machine
- PR #3375³⁵⁴⁴ - Replacing wrapper for __libc_start_main with main
- PR #3374³⁵⁴⁵ - Adds hpx_wrap to HPX_LINK_LIBRARIES which links only when specified.
- PR #3373³⁵⁴⁶ - Forcing cache settings in HPXConfig.cmake to guarantee updated values
- PR #3372³⁵⁴⁷ - Fix some more c++11 build problems
- PR #3371³⁵⁴⁸ - Adds HPX_LINKER_FLAGS to HPX applications without editing their source codes
- PR #3370³⁵⁴⁹ - util::format: add typeSpecifier<> specializations for %!s(MISSING) and %!!(MISSING)s
- PR #3369³⁵⁵⁰ - Adding configuration option to allow explicit disable of the new hpx_main feature on Linux
- PR #3368³⁵⁵¹ - Updates doc with recent hpx_wrap implementation
- PR #3367³⁵⁵² - Adds Mac OS implementation to hpx_main.hpp
- PR #3365³⁵⁵³ - Fix order of hpx libs in HPX_CONF_LIBRARIES.
- PR #3363³⁵⁵⁴ - Apex fixing null wrapper
- PR #3361³⁵⁵⁵ - Making sure all parcels get destroyed on an HPX thread (TCP pp)
- PR #3359³⁵⁵⁶ - Feature/improveerrorforcompiler
- PR #3357³⁵⁵⁷ - Static/dynamic executable implementation
- PR #3355³⁵⁵⁸ - Reverting changes introduced by #3283 as those make applications hang
- PR #3354³⁵⁵⁹ - Add external dependencies to HPX_LIBRARY_DIR
- PR #3353³⁵⁶⁰ - Fix libfabric tcp
- PR #3351³⁵⁶¹ - Move obsolete header to tests directory.
- PR #3350³⁵⁶² - Renaming two functions to avoid problem described in #3285
- PR #3349³⁵⁶³ - Make idle backoff exponential with maximum sleep time

- PR #3347³⁵⁶⁴ - Replace *simple_component** with *component** in the Documentation
- PR #3346³⁵⁶⁵ - Fix CMakeLists.txt example in quick start
- PR #3345³⁵⁶⁶ - Fix automatic setting of HPX_MORE_THAN_64_THREADS
- PR #3344³⁵⁶⁷ - Reduce amount of information printed for unknown command line options
- PR #3343³⁵⁶⁸ - Safeguard HPX against destruction in global contexts
- PR #3341³⁵⁶⁹ - Allowing for all command line options to be used as configuration settings
- PR #3340³⁵⁷⁰ - Always convert inspect results to JUnit XML
- PR #3336³⁵⁷¹ - Only run docker push on master on CircleCI
- PR #3335³⁵⁷² - Update description of hpx.os_threads config parameter.
- PR #3334³⁵⁷³ - Making sure early logging settings don't get mixed with others
- PR #3333³⁵⁷⁴ - Update CMake links and versions in documentation
- PR #3332³⁵⁷⁵ - Add notes on target suffixes to CMake documentation
- PR #3331³⁵⁷⁶ - Add quickstart section to documentation
- PR #3330³⁵⁷⁷ - Rename resource_partitioner test to avoid conflicts with pseudodependencies
- PR #3328³⁵⁷⁸ - Making sure object is pinned while executing actions, even if action returns a future
- PR #3327³⁵⁷⁹ - Add missing std::forward to tuple.hpp
- PR #3326³⁵⁸⁰ - Make sure logging is up and running while modules are being discovered.
- PR #3324³⁵⁸¹ - Replace C++14 overload of std::equal with C++11 code.
- PR #3323³⁵⁸² - Fix a missing apex thread data (wrapper) initialization
- PR #3320³⁵⁸³ - Adding support for -std=c++2a (define *HPX_WITH_CXX2A=On*)
- PR #3319³⁵⁸⁴ - Replacing C++14 feature with equivalent C++11 code
- PR #3317³⁵⁸⁵ - Fix compilation with VS 15.7.1 and /std:c++latest
- PR #3316³⁵⁸⁶ - Fix includes for 1d_stencil_*_omp examples

- PR #3036³⁶³⁷ - Switching to CircleCI 2.0

HPX V1.1.0 (Mar 24, 2018)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

- We have changed the way *HPX* manages the processing units on a node. We do not longer implicitly bind all available cores to a single thread pool. The user has now full control over what processing units are bound to what thread pool, each with a separate scheduler. It is now also possible to create your own scheduler implementation and control what processing units this scheduler should use. We added the `hpx::resource::partitioner` that manages all available processing units and assigns resources to the used thread pools. Thread pools can be now be suspended/resumed independently. This functionality helps in running *HPX* concurrently to code that is directly relying on OpenMP³⁶³⁸ and/or MPI³⁶³⁹.
- We have continued to implement various parallel algorithms. *HPX* now almost completely implements all of the parallel algorithms as specified by the C++17 Standard³⁶⁴⁰. We have also continued to implement these algorithms for the distributed use case (for segmented data structures, such as `hpx::partitioned_vector`).
- Added a compatibility layer for `std::thread`, `std::mutex`, and `std::condition_variable` allowing for the code to use those facilities where available and to fall back to the corresponding Boost facilities otherwise. The CMake³⁶⁴¹ configuration option `-DHPX_WITH_THREAD_COMPATIBILITY=On` can be used to force using the Boost equivalents.
- The parameter sequence for the `hpx::parallel::transform_inclusive_scan` overload taking one iterator range has changed (again) to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake³⁶⁴².
- The parameter sequence for the `hpx::parallel::inclusive_scan` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY=On` to CMake.
- Added a helper facility `hpx::local_new` which is equivalent to `hpx::new_` except that it creates components locally only. As a consequence, the used component constructor may accept non-serializable argument types and/or non-const references or pointers.
- Removed the (broken) component type `hpx::lcos::queue<T>`. The old type is still available at configure time by passing `-DHPX_WITH_QUEUE_COMPATIBILITY=On` to CMake.

³⁶⁴⁰ <http://www.open-std.org/jtc1/sc22/wg21>

³⁶⁴¹ <https://www.cmake.org>

³⁶⁴² <https://www.cmake.org>

- The parallel algorithms adopted for C++17 restrict the iterator categories usable with those to at least forward iterators. Our implementation of the parallel algorithms was supporting input iterators (and output iterators) as well by simply falling back to sequential execution. We have now made our implementations conforming by requiring at least forward iterators. In order to enable the old behavior use the compatibility option `-DHPX_WITH_ALGORITHM_INPUT_ITERATOR_SUPPORT=On` on the [CMake](#)³⁶⁴³ command line.
- We have added the functionalities allowing for LCOs being implemented using (simple) components. Before LCOs had to always be implemented using managed components.
- User defined components don't have to be default-constructible anymore. Return types from actions don't have to be default-constructible anymore either. Our serialization layer now in general supports non-default-constructible types.
- We have added a new launch policy `hpx::launch::lazy` that allows one to defer the decision on what launch policy to use to the point of execution. This policy is initialized with a function (object) that – when invoked – is expected to produce the desired launch policy.

Breaking changes

- We have dropped support for the gcc compiler version V4.8. The minimal gcc version we now test on is gcc V4.9. The minimally required version of [CMake](#)³⁶⁴⁴ is now V3.3.2.
- We have dropped support for the Visual Studio 2013 compiler version. The minimal Visual Studio version we now test on is Visual Studio 2015.5.
- We have dropped support for the Boost V1.51-V1.54. The minimal version of Boost we now test is Boost V1.55.
- We have dropped support for the `hpx::util::unwrapped` API. `hpx::util::unwrapped` will stay functional to some degree, until it finally gets removed in a later version of HPX. The functional usage of `hpx::util::unwrapped` should be changed to the new `hpx::util::unwrapping` function whereas the immediate usage should be replaced to `hpx::util::unwrap`.
- The performance counter names referring to properties as exposed by the threading subsystem have changes as those now additionally have to specify the thread-pool. See the corresponding documentation for more details.
- The overloads of `hpx::async` that invoke an action do not perform implicit unwrapping of the returned future anymore in case the invoked function does return a future in the first place. In this case `hpx::async` now returns a `hpx::future<future<T>>` making its behavior conforming to its local counterpart.
- We have replaced the use of `boost::exception_ptr` in our APIs with the equivalent `std::exception_ptr`. Please change your codes accordingly. No compatibility settings are provided.
- We have removed the compatibility settings for `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` as their life-cycle has reached its end.
- We have removed the experimental thread schedulers `hierarchy_scheduler`, `periodic_priority_scheduler` and `throttling_scheduler` in an effort to clean up and consolidate our thread schedulers.

³⁷¹¹ <https://github.com/STELLAR-GROUP/hpx/pull/3156>

- PR #3154³⁷¹² - More refactorings based on clang-tidy reports
- PR #3153³⁷¹³ - Fixing a race with timed suspension
- PR #3152³⁷¹⁴ - Documentation for runtime suspension
- PR #3151³⁷¹⁵ - Use small_vector only from boost version 1.59 onwards
- PR #3150³⁷¹⁶ - Avoiding more stack overflows
- PR #3148³⁷¹⁷ - Refactoring component_base and base_action/transfer_base_action
- PR #3147³⁷¹⁸ - Move yield_while out of detail namespace and into own file
- PR #3145³⁷¹⁹ - Remove a leftover of the cxx11 std array cleanup
- PR #3144³⁷²⁰ - Minor changes to how actions are executed
- PR #3143³⁷²¹ - Fix stack overhead
- PR #3142³⁷²² - Fix typo in config.hpp
- PR #3141³⁷²³ - Fixing small_vector compatibility with older boost version
- PR #3140³⁷²⁴ - is_heap_text fix
- Issue #3139³⁷²⁵ - Error in is_heap_tests.hpp
- PR #3138³⁷²⁶ - Partially reverting #3126
- PR #3137³⁷²⁷ - Suspend speedup
- PR #3136³⁷²⁸ - Revert “Fixing #2325”
- PR #3135³⁷²⁹ - Improving destruction of threads
- Issue #3134³⁷³⁰ - HPX_SERIALIZATION_SPLIT_FREE does not stop compiler from looking for serialize() method
- PR #3133³⁷³¹ - Make hwloc compulsory
- PR #3132³⁷³² - Update CXX14 constexpr feature test
- PR #3131³⁷³³ - Fixing #2325
- PR #3130³⁷³⁴ - Avoid completion handler allocation

³⁷⁵⁷ <https://github.com/STELLAR-GROUP/hpx/pull/3107>

- PR #3106³⁷⁵⁸ - Add cmake test for std::decay_t to fix cuda build
- PR #3105³⁷⁵⁹ - Fixing refcount for async traversal frame
- PR #3104³⁷⁶⁰ - Local execution of direct actions is now actually performed directly
- PR #3103³⁷⁶¹ - Adding support for generic counter_raw_values performance counter type
- Issue #3102³⁷⁶² - Introduce generic performance counter type returning an array of values
- PR #3101³⁷⁶³ - Revert “Adapting stack overhead limit for gcc 4.9”
- PR #3100³⁷⁶⁴ - Fix #3068 (condition_variable deadlock)
- PR #3099³⁷⁶⁵ - Fixing lock held during suspension in papi counter component
- PR #3098³⁷⁶⁶ - Unbreak broadcast_wait_for_2822 test
- PR #3097³⁷⁶⁷ - Adapting stack overhead limit for gcc 4.9
- PR #3096³⁷⁶⁸ - fix detection of cxx11_std_atomic
- PR #3095³⁷⁶⁹ - Add ciso646 header to get _LIBCPP_VERSION for testing inplace merge
- PR #3094³⁷⁷⁰ - Relax atomic operations on performance counter values
- PR #3093³⁷⁷¹ - Short-circuit all_of/any_of/none_of instantiations
- PR #3092³⁷⁷² - Take advantage of C++14 lambda capture initialization syntax, where possible
- PR #3091³⁷⁷³ - Remove more references to Boost from logging code
- PR #3090³⁷⁷⁴ - Unify use of yield/yield_k
- PR #3089³⁷⁷⁵ - Fix a strange thing in parallel::detail::handle_exception. (Fix #2834.)
- Issue #3088³⁷⁷⁶ - A strange thing in parallel::sort.
- PR #3087³⁷⁷⁷ - Fixing assertion in default_distribution_policy
- PR #3086³⁷⁷⁸ - Implement parallel::remove and parallel::remove_if
- PR #3085³⁷⁷⁹ - Addressing breaking changes in Boost V1.66
- PR #3084³⁷⁸⁰ - Ignore build warnings round 2

- PR #3056³⁸⁰⁴ - Fix some build warnings caused by unused variables/unnecessary tests
- PR #3055³⁸⁰⁵ - Update documentation for running tests
- Issue #3054³⁸⁰⁶ - Assertion failure when using bulk hpx::new_ in asynchronous mode
- PR #3052³⁸⁰⁷ - Do not bind test running to cmake test build rule
- PR #3051³⁸⁰⁸ - Fix HPX-Qt interaction in Qt example.
- Issue #3048³⁸⁰⁹ - nqueen example fails occasionally
- PR #3047³⁸¹⁰ - Fixing #3044
- PR #3046³⁸¹¹ - Add OS thread suspension
- PR #3042³⁸¹² - PyCicle - first attempt at a build tool for checking PR's
- PR #3041³⁸¹³ - Fix a problem about asynchronous execution of parallel::merge and parallel::partition.
- PR #3040³⁸¹⁴ - Fix a mistake about exception handling in asynchronous execution of scan_partitioner.
- PR #3039³⁸¹⁵ - Consistently use executors to schedule work
- PR #3038³⁸¹⁶ - Fixing local direct function execution and lambda actions perfect forwarding
- PR #3035³⁸¹⁷ - Make parallel unit test names match build target/folder names
- PR #3033³⁸¹⁸ - Fix setting of default build type
- Issue #3032³⁸¹⁹ - Fix partitioner arg copy found in #2982
- Issue #3031³⁸²⁰ - Errors linking libhpx.so due to missing references (master branch, commit 6679a8882)
- PR #3030³⁸²¹ - Revert "implement executor then interface with && forwarding reference"
- PR #3029³⁸²² - Run CI inspect checks before building
- PR #3028³⁸²³ - Added range version of parallel::move
- Issue #3027³⁸²⁴ - Implement all scheduling APIs in terms of executors
- PR #3026³⁸²⁵ - implement executor then interface with && forwarding reference
- PR #3025³⁸²⁶ - Fix typo uninitialized to uninitialized

- PR #2973³⁸⁷³ - Fix small typos
- PR #2972³⁸⁷⁴ - Adding uintstd.h header
- PR #2971³⁸⁷⁵ - Fall back to creating local components using local_new
- PR #2970³⁸⁷⁶ - Improve is_tuple_like trait
- PR #2969³⁸⁷⁷ - Fix HPX_WITH_MORE_THAN_64_THREADS default value
- PR #2968³⁸⁷⁸ - Cleaning up dataflow overload set
- PR #2967³⁸⁷⁹ - Make parallel::merge is stable. (Fix #2964.)
- PR #2966³⁸⁸⁰ - Fixing a couple of held locks during exception handling
- PR #2965³⁸⁸¹ - Adding missing #include
- Issue #2964³⁸⁸² - parallel merge is not stable
- PR #2963³⁸⁸³ - Making sure any function object passed to dataflow is released after being invoked
- PR #2962³⁸⁸⁴ - Partially reverting #2891
- PR #2961³⁸⁸⁵ - Attempt to fix the gcc 4.9 problem with the async pack traversal
- Issue #2959³⁸⁸⁶ - Program terminates during error handling
- Issue #2958³⁸⁸⁷ - HPX_PLAIN_ACTION breaks due to missing include
- PR #2957³⁸⁸⁸ - Fixing errors generated by mixing different attribute syntaxes
- Issue #2956³⁸⁸⁹ - Mixing attribute syntaxes leads to compiler errors
- Issue #2955³⁸⁹⁰ - Fix OS-Thread throttling
- PR #2953³⁸⁹¹ - Making sure any hpx.os_threads=N supplied through a -hpx::config file is taken into account
- PR #2952³⁸⁹² - Removing wrong call to cleanup_terminated_locked
- PR #2951³⁸⁹³ - Revert “Make sure the function vtables are initialized before use”
- PR #2950³⁸⁹⁴ - Fix a namespace compilation error when some schedulers are disabled
- Issue #2949³⁸⁹⁵ - master branch giving lockups on shutdown

- Issue #528⁴²⁵³ - Add support for known failures and warning count/comparisons to hpx_run_tests.py

HPX V1.0.0 (Apr 24, 2017)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

- Added the facility `hpx::split_future` which allows one to convert a `future<tuple<Ts...>>` into a `tuple<future<Ts>...>`. This functionality is not available when compiling *HPX* with VS2012.
- Added a new type of performance counter which allows one to return a list of values for each invocation. We also added a first counter of this type which collects a histogram of the times between parcels being created.
- Added new LCOs: `hpx::lcos::channel` and `hpx::lcos::local::channel` which are very similar to the well known channel constructs used in the Go language.
- Added new performance counters reporting the amount of data handled by the networking layer on a action-by-action basis (please see PR #2289⁴²⁵⁴ for more details).
- Added a new facility `hpx::lcos::barrier`, replacing the equally named older one. The new facility has a slightly changed API and is much more efficient. Most notable, the new facility exposes a (global) function `hpx::lcos::barrier::synchronize()` which represents a global barrier across all localities.

- We have started to add support for vectorization to our parallel algorithm implementations. This support depends on using an external library, currently either Vc Library or [boost_simd](#). Please see Issue #2333⁴²⁵⁵ for a list of currently supported algorithms. This is an experimental feature and its implementation and/or API might change in the future. Please see this blog-post⁴²⁵⁶ for more information.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overload can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17. The old `inner_product` names can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- Added versions of `hpx::get_ptr` taking client side representations for component instances as their parameter (instead of a global id).
- Added the helper utility `hpx::performance_counters::performance_counter_set` helping to encapsulate a set of performance counters to be managed concurrently.
- All execution policies and related classes have been renamed to be consistent with the naming changes applied for C++17. All policies now live in the namespace `hpx::parallel::execution`. The old names can be still enabled at configure time by specifying `-DHPX_WITH_EXECUTION_POLICY_COMPATIBILITY=On` to CMake.
- The thread scheduling subsystem has undergone a major refactoring which results in significant performance improvements. We have also improved the performance of creating `hpx::future` and of various facilities handling those.
- We have consolidated all of the code in HPX.Compute related to the integration of CUDA. `hpx::partitioned_vector` has been enabled to be usable with `hpx::compute::vector` which allows one to place the partitions on one or more GPU devices.
- Added new performance counters exposing various internals of the thread scheduling subsystem, such as the current idle- and busy-loop counters and instantaneous scheduler utilization.
- Extended and improved the use of the ITTNotify hooks allowing to collect performance counter data and function annotation information from within the Intel Amplifier tool.

Breaking changes

- We have dropped support for the gcc compiler versions V4.6 and 4.7. The minimal gcc version we now test on is gcc V4.8.
- We have removed (default) support for `boost::chrono` in interfaces, uses of it have been replaced with `std::chrono`. This facility can be still enabled at configure time by specifying `-DHPX_WITH_BOOST_CHRONO_COMPATIBILITY=On` to CMake.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17.

⁴²⁵⁵ <https://github.com/STELLAR-GROUP/hpx/issues/2333>

⁴²⁵⁶ <http://stellar-group.org/2016/09/vectorized-cpp-parallel-algorithms-with-hpx/>

- the build options `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` are now disabled by default. Please change your code still depending on the deprecated interfaces.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #2596⁴²⁵⁷ - Adding apex data
- PR #2595⁴²⁵⁸ - Remove obsolete file
- Issue #2594⁴²⁵⁹ - FindOpenCL.cmake mismatch with the official cmake module
- PR #2592⁴²⁶⁰ - First attempt to introduce spmd_block in hpx
- Issue #2591⁴²⁶¹ - Feature request: continuation (then) which does not require the callable object to take a future<R> as parameter
- PR #2588⁴²⁶² - Daint fixes
- PR #2587⁴²⁶³ - Fixing transfer_(continuation)_action::schedule
- PR #2585⁴²⁶⁴ - Work around MSVC having an ICE when compiling with -Ob2
- PR #2583⁴²⁶⁵ - changing 7zip command to 7za in roll_release.sh
- PR #2582⁴²⁶⁶ - First attempt to introduce spmd_block in hpx
- PR #2581⁴²⁶⁷ - Enable annotated function for parallel algorithms
- PR #2580⁴²⁶⁸ - First attempt to introduce spmd_block in hpx
- PR #2579⁴²⁶⁹ - Make thread NICE level setting an option
- PR #2578⁴²⁷⁰ - Implementing enqueue instead of busy wait when no sender is available
- PR #2577⁴²⁷¹ - Retrieve -std=c++11 consistent nvcc flag
- PR #2576⁴²⁷² - Add missing dependencies of cuda based tests
- PR #2575⁴²⁷³ - Remove warnings due to some captured variables
- PR #2573⁴²⁷⁴ - Attempt to resolve resolve_locality
- PR #2572⁴²⁷⁵ - Adding APEX hooks to background thread

- Issue #2517⁴³²² - Race condition during Parcel Coalescing Handler creation
- Issue #2516⁴³²³ - HPX locks up when using at least 256 localities
- Issue #2515⁴³²⁴ - error: Install cannot find “/lib/hpx/libparcel_coalescing.so.0.0.99” but I can see that file
- PR #2514⁴³²⁵ - Making sure that all continuations of a shared_future are invoked in order
- PR #2513⁴³²⁶ - Fixing locks held during suspension
- PR #2512⁴³²⁷ - MPI Parcelpoint improvements and fixes related to the background work changes
- PR #2511⁴³²⁸ - Fixing bit-wise (zero-copy) serialization
- Issue #2509⁴³²⁹ - Linking errors in hwloc_topology
- PR #2508⁴³³⁰ - Added documentation for debugging with core files
- PR #2506⁴³³¹ - Fixing background work invocations
- PR #2505⁴³³² - Fix tuple serialization
- Issue #2504⁴³³³ - Ensure continuations are called in the order they have been attached
- PR #2503⁴³³⁴ - Adding serialization support for Vc v2 (datapar)
- PR #2502⁴³³⁵ - Resolve various, minor compiler warnings
- PR #2501⁴³³⁶ - Some other fixes around cuda examples
- Issue #2500⁴³³⁷ - nvcc / cuda clang issue due to a missing -DHPX_WITH_CUDA flag
- PR #2499⁴³³⁸ - Adding support for std::array to wait_all and friends
- PR #2498⁴³³⁹ - Execute background work as HPX thread
- PR #2497⁴³⁴⁰ - Fixing configuration options for spinlock-deadlock detection
- PR #2496⁴³⁴¹ - Accounting for different compilers in CrayKNL toolchain file
- PR #2494⁴³⁴² - Adding component base class which ties a component instance to a given executor
- PR #2493⁴³⁴³ - Enable controlling amount of pending threads which must be available to allow thread stealing
- PR #2492⁴³⁴⁴ - Adding new command line option –hpx:print-counter-reset

HPX V0.9.99 (Jul 15, 2016)

General changes

As the version number of this release hints, we consider this release to be a preview for the upcoming *HPX* V1.0. All of the functionalities we set out to implement for V1.0 are in place; all of the features we wanted to have exposed are ready. We are very happy with the stability and performance of *HPX* and we would like to present this release to the community in order for us to gather broad feedback before releasing V1.0. We still expect for some minor details to change, but on the whole this release represents what we would like to have in a V1.0.

Overall, since the last release we have had almost 1600 commits while closing almost 400 tickets. These numbers reflect the incredible development activity we have seen over the last couple of months. We would like to express a big ‘Thank you!’ to all contributors and those who helped to make this release happen.

The most notable addition in terms of new functionality available with this release is the full implementation of object migration (i.e. the ability to transparently move *HPX* components to a different compute node). Additionally, this release of *HPX* cleans up many minor issues and some API inconsistencies.

Here are some of the main highlights and changes for this release (in no particular order):

- We have fixed a couple of issues in AGAS and the parcel layer which have caused hangs, segmentation faults at exit, and a slowdown of applications over time. Fixing those has significantly increased the overall stability and performance of distributed runs.
- We have started to add parallel algorithm overloads based on the C++ Extensions for Ranges (N4560⁴⁵⁸⁰) proposal. This also includes the addition of projections to the existing algorithms. Please see Issue #1668⁴⁵⁸¹ for a list of algorithms which have been adapted to N4560⁴⁵⁸².
- We have implemented index-based parallel for-loops based on a corresponding standardization proposal (P0075R1⁴⁵⁸³). Please see Issue #2016⁴⁵⁸⁴ for a list of available algorithms.
- We have added implementations for more parallel algorithms as proposed for the upcoming C++ 17 Standard. See Issue #1141⁴⁵⁸⁵ for an overview of which algorithms are available by now.
- We have started to implement a new prototypical functionality with *HPX.Compute* which uniformly exposes some of the higher level APIs to heterogeneous architectures (currently CUDA). This functionality is an early preview and should not be considered stable. It may change considerably in the future.
- We have pervasively added (optional) executor arguments to all API functions which schedule new work. Executors are now used throughout the code base as the main means of executing tasks.

⁴⁵⁸² <http://wg21.link/n4560>

⁴⁵⁸³ <http://wg21.link/p0075r1>

⁴⁵⁸⁴ <https://github.com/STELLAR-GROUP/hpx/issues/2016>

⁴⁵⁸⁵ <https://github.com/STELLAR-GROUP/hpx/issues/1141>

- Added `hpx::make_future<R>(future<T> &&)` allowing to convert a future of any type T into a future of any other type R, either based on default conversion rules of the embedded types or using a given explicit conversion function.
- We finally finished the implementation of transparent migration of components to another locality. It is now possible to trigger a migration operation without ‘stopping the world’ for the object to migrate. *HPX* will make sure that no work is being performed on an object before it is migrated and that all subsequently scheduled work for the migrated object will be transparently forwarded to the new locality. Please note that the global id of the migrated object does not change, thus the application will not have to be changed in any way to support this new functionality. Please note that this feature is currently considered experimental. See [Issue #559⁴⁵⁸⁶](#) and [PR #1966⁴⁵⁸⁷](#) for more details.
- The `hpx::dataflow` facility is now usable with actions. Similarly to `hpx::async`, actions can be specified as an explicit template argument (`hpx::dataflow<Action>(target, ...)`) or as the first argument (`hpx::dataflow(Action(), target, ...)`). We have also enabled the use of distribution policies as the target for dataflow invocations. Please see [Issue #1265⁴⁵⁸⁸](#) and [PR #1912⁴⁵⁸⁹](#) for more information.
- Adding overloads of `gather_here` and `gather_there` to accept the plain values of the data to gather (in addition to the existing overloads expecting futures).
- We have cleaned up and refactored large parts of the code base. This helped reducing compile and link times of *HPX* itself and also of applications depending on it. We have further decreased the dependency of *HPX* on the Boost libraries by replacing part of those with facilities available from the standard libraries.
- Wherever possible we have removed dependencies of our API on Boost by replacing those with the equivalent facility from the C++11 standard library.
- We have added new performance counters for parcel coalescing, file-IO, the AGAS cache, and overall scheduler time. Resetting performance counters has been overhauled and fixed.
- We have introduced a generic client type `hpx::components::client<>` and added support for using it with `hpx::async`. This removes the necessity to implement specific client types for every component type without losing type safety. This deemphasizes the need for using the low level `hpx::id_type` for referencing (possibly remote) component instances. The plan is to deprecate the direct use of `hpx::id_type` in user code in the future.
- We have added a special iterator which supports automatic prefetching of one or more arrays for speeding up loop-like code (see `hpx::parallel::util::make_prefetcher_context()`).
- We have extended the interfaces exposed from executors (as proposed by [N4406⁴⁵⁹⁰](#)) to accept an arbitrary number of arguments.

Breaking changes

- In order to move the dataflow facility to namespace `hpx` we added a definition of `hpx::dataflow` which might create ambiguities in existing codes. The previous definition of this facility (`hpx::lcos::local::dataflow`) has been deprecated and is available only if the constant `-DHPX_WITH_LOCAL_DATAFLOW_COMPATIBILITY=On` to [CMake⁴⁵⁹¹](#) is defined at configuration time. Please explicitly qualify all uses of the dataflow facility if you enable this compatibility setting and encounter ambiguities.
- The adaptation of the C++ Extensions for Ranges ([N4560⁴⁵⁹²](#)) proposal imposes some breaking changes related

⁴⁵⁸⁶ <https://github.com/STELLAR-GROUP/hpx/issues/559>

⁴⁵⁸⁷ <https://github.com/STELLAR-GROUP/hpx/pull/1966>

⁴⁵⁸⁸ <https://github.com/STELLAR-GROUP/hpx/issues/1265>

⁴⁵⁸⁹ <https://github.com/STELLAR-GROUP/hpx/pull/1912>

⁴⁵⁹⁰ <http://wg21.link/n4406>

⁴⁵⁹¹ <https://www.cmake.org>

⁴⁵⁹² <http://wg21.link/n4560>

to the return types of some of the parallel algorithms. Please see [Issue #1668](#)⁴⁵⁹³ for a list of algorithms which have already been adapted.

- The facility `hpx::lcos::make_future_void()` has been replaced by `hpx::make_future<void>()`.
- We have removed support for Intel V13 and gcc 4.4.x.
- We have removed (default) support for the generic `hpx::parallel::execution_policy` because it was removed from the Parallelism TS ([_cpp11_n4104_](#)) while it was being added to the upcoming C++17 Standard. This facility can be still enabled at configure time by specifying `-DHPX_WITH_GENERIC_EXECUTION_POLICY=On` to CMake.
- Uses of `boost::shared_ptr` and related facilities have been replaced with `std::shared_ptr` and friends. Uses of `boost::unique_lock`, `boost::lock_guard` etc. have also been replaced by the equivalent (and equally named) tools available from the C++11 standard library.
- Facilities that used to expect an explicit `boost::unique_lock` now take an `std::unique_lock`. Additionally, `condition_variable` no longer aliases `condition_variable_any`; its interface now only works with `std::unique_lock<local::mutex>`.
- Uses of `boost::function`, `boost::bind`, `boost::tuple` have been replaced by the corresponding facilities in *HPX* (`hpx::util::function`, `hpx::util::bind`, and `hpx::util::tuple`, respectively).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [PR #2250](#)⁴⁵⁹⁴ - change default chunker of parallel executor to static one
- [PR #2247](#)⁴⁵⁹⁵ - HPX on ppc64le
- [PR #2244](#)⁴⁵⁹⁶ - Fixing MSVC problems
- [PR #2238](#)⁴⁵⁹⁷ - Fixing small typos
- [PR #2237](#)⁴⁵⁹⁸ - Fixing small typos
- [PR #2234](#)⁴⁵⁹⁹ - Fix broken add test macro when extra args are passed in
- [PR #2231](#)⁴⁶⁰⁰ - Fixing possible race during future awaiting in serialization
- [PR #2230](#)⁴⁶⁰¹ - Fix stream nvcc
- [PR #2229](#)⁴⁶⁰² - Fixed run_as_hpx_thread
- [PR #2228](#)⁴⁶⁰³ - On prefetching_test branch : adding prefetching_iterator and related tests used for prefetching containers within lambda functions
- [PR #2227](#)⁴⁶⁰⁴ - Support for HPXCL's opencl::event
- [PR #2226](#)⁴⁶⁰⁵ - Preparing for release of V0.9.99

⁴⁶⁰⁵ <https://github.com/STELLAR-GROUP/hpx/pull/2226>

- PR #2225⁴⁶⁰⁶ - fix issue when compiling components with hpxcxx
- PR #2224⁴⁶⁰⁷ - Compute alloc fix
- PR #2223⁴⁶⁰⁸ - Simplify promise
- PR #2222⁴⁶⁰⁹ - Replace last uses of boost::function by util::function_nonser
- PR #2221⁴⁶¹⁰ - Fix config tests
- PR #2220⁴⁶¹¹ - Fixing gcc 4.6 compilation issues
- PR #2219⁴⁶¹² - nullptr support for [unique_]function
- PR #2218⁴⁶¹³ - Introducing clang tidy
- PR #2216⁴⁶¹⁴ - Replace NULL with nullptr
- Issue #2214⁴⁶¹⁵ - Let inspect flag use of NULL, suggest nullptr instead
- PR #2213⁴⁶¹⁶ - Require support for nullptr
- PR #2212⁴⁶¹⁷ - Properly find jemalloc through pkg-config
- PR #2211⁴⁶¹⁸ - Disable a couple of warnings reported by Intel on Windows
- PR #2210⁴⁶¹⁹ - Fixed host::block_allocator::bulk_construct
- PR #2209⁴⁶²⁰ - Started to clean up new sort algorithms, made things compile for sort_by_key
- PR #2208⁴⁶²¹ - A couple of fixes that were exposed by a new sort algorithm
- PR #2207⁴⁶²² - Adding missing includes in /hpx/include/serialization.hpp
- PR #2206⁴⁶²³ - Call package_action::get_future before package_action::apply
- PR #2205⁴⁶²⁴ - The indirect_packaged_task::operator() needs to be run on a HPX thread
- PR #2204⁴⁶²⁵ - Variadic executor parameters
- PR #2203⁴⁶²⁶ - Delay-initialize members of partitioned iterator
- PR #2202⁴⁶²⁷ - Added segmented fill for hpx::vector
- Issue #2201⁴⁶²⁸ - Null Thread id encountered on partitioned_vector

- PR #2054⁴⁷⁶⁷ - Add a forwarding coroutine header
- PR #2053⁴⁷⁶⁸ - Replace uses of boost::unordered_map with std::unordered_map
- PR #2052⁴⁷⁶⁹ - Rewrite tuple unwrap
- PR #2050⁴⁷⁷⁰ - Replace uses of BOOST_SCOPED_ENUM with C++11 scoped enums
- PR #2049⁴⁷⁷¹ - Attempt to narrow down split_credit problem
- PR #2048⁴⁷⁷² - Fixing gcc startup hangs
- PR #2047⁴⁷⁷³ - Fixing when_xxx and wait_xxx for MSVC12
- PR #2046⁴⁷⁷⁴ - adding persistent_auto_chunk_size and related tests for for_each
- PR #2045⁴⁷⁷⁵ - Fixing HPX_HAVE_THREAD_BACKTRACE_DEPTH build time configuration
- PR #2044⁴⁷⁷⁶ - Adding missing service executor types
- PR #2043⁴⁷⁷⁷ - Removing ambiguous definitions for is_future_range and future_range_traits
- PR #2042⁴⁷⁷⁸ - Clarify that HPX builds can use (much) more than 2GB per process
- PR #2041⁴⁷⁷⁹ - Changing future_iterator_traits to support pointers
- Issue #2040⁴⁷⁸⁰ - Improve documentation memory usage warning?
- PR #2039⁴⁷⁸¹ - Coroutine cleanup
- PR #2038⁴⁷⁸² - Fix cmake policy CMP0042 warning MACOSX_RPATH
- PR #2037⁴⁷⁸³ - Avoid redundant specialization of [**unique**]function_nonser
- PR #2036⁴⁷⁸⁴ - nvcc dies with an internal error upon pushing/popping warnings inside templates
- Issue #2035⁴⁷⁸⁵ - Use a less restrictive iterator definition in hpx::lcos::detail::future_iterator_traits
- PR #2034⁴⁷⁸⁶ - Fixing compilation error with thread queue wait time performance counter
- Issue #2033⁴⁷⁸⁷ - Compilation error when compiling with thread queue waittime performance counter
- Issue #2032⁴⁷⁸⁸ - Ambiguous template instantiation for is_future_range and future_range_traits.
- PR #2031⁴⁷⁸⁹ - Don't restart timer on every incoming parcel

- PR #2030⁴⁷⁹⁰ - Unify handling of execution policies in parallel algorithms
- PR #2029⁴⁷⁹¹ - Make pkg-config .pc files use .dylib on OSX
- PR #2028⁴⁷⁹² - Adding process component
- PR #2027⁴⁷⁹³ - Making check for compiler compatibility independent on compiler path
- PR #2025⁴⁷⁹⁴ - Fixing inspect tool
- PR #2024⁴⁷⁹⁵ - Intel13 removal
- PR #2023⁴⁷⁹⁶ - Fix errors related to older boost versions and parameter pack expansions in lambdas
- Issue #2022⁴⁷⁹⁷ - gmake fail: “No rule to make target /usr/lib46/libboost_context-mt.so”
- PR #2021⁴⁷⁹⁸ - Added Sudoku example
- Issue #2020⁴⁷⁹⁹ - Make errors related to init_globally.cpp example while building HPX out of the box
- PR #2019⁴⁸⁰⁰ - Fixed some compilation and cmake errors encountered in nqueen example
- PR #2018⁴⁸⁰¹ - For loop algorithms
- PR #2017⁴⁸⁰² - Non-recursive at_index implementation
- Issue #2016⁴⁸⁰³ - Add index-based for-loops
- Issue #2015⁴⁸⁰⁴ - Change default bind-mode to balanced
- PR #2014⁴⁸⁰⁵ - Fixed dataflow if invoked action returns a future
- PR #2013⁴⁸⁰⁶ - Fixing compilation issues with external example
- PR #2012⁴⁸⁰⁷ - Added Sierpinski Triangle example
- Issue #2011⁴⁸⁰⁸ - Compilation error while running sample hello_world_component code
- PR #2010⁴⁸⁰⁹ - Segmented move implemented for hpx::vector
- Issue #2009⁴⁸¹⁰ - pkg-config order incorrect on 14.04 / GCC 4.8
- Issue #2008⁴⁸¹¹ - Compilation error in dataflow of action returning a future
- PR #2007⁴⁸¹² - Adding new performance counter exposing overall scheduler time

- PR #2006⁴⁸¹³ - Function includes
- PR #2005⁴⁸¹⁴ - Adding an example demonstrating how to initialize HPX from a global object
- PR #2004⁴⁸¹⁵ - Fixing 2000
- PR #2003⁴⁸¹⁶ - Adding generation parameter to gather to enable using it more than once
- PR #2002⁴⁸¹⁷ - Turn on position independent code to solve link problem with hpx_init
- Issue #2001⁴⁸¹⁸ - Gathering more than once segfaults
- Issue #2000⁴⁸¹⁹ - Undefined reference to hpx::assertion_failed
- Issue #1999⁴⁸²⁰ - Seg fault in hpx::lcos::base_lco_with_value<*>::set_value_nonvirt() when running octo-tiger
- PR #1998⁴⁸²¹ - Detect unknown command line options
- PR #1997⁴⁸²² - Extending thread description
- PR #1996⁴⁸²³ - Adding natvis files to solution (MSVC only)
- Issue #1995⁴⁸²⁴ - Command line handling does not produce error
- PR #1994⁴⁸²⁵ - Possible missing include in test_utils.hpp
- PR #1993⁴⁸²⁶ - Add missing LANGUAGES tag to a hpx_add_compile_flag_if_available() call in CMakeLists.txt
- PR #1992⁴⁸²⁷ - Fixing shared_executor_test
- PR #1991⁴⁸²⁸ - Making sure the winsock library is properly initialized
- PR #1990⁴⁸²⁹ - Fixing bind_test placeholder ambiguity coming from boost-1.60
- PR #1989⁴⁸³⁰ - Performance tuning
- PR #1987⁴⁸³¹ - Make configurable size of internal storage in util::function
- PR #1986⁴⁸³² - AGAS Refactoring+1753 Cache mods
- PR #1985⁴⁸³³ - Adding missing task_block::run() overload taking an executor
- PR #1984⁴⁸³⁴ - Adding an optimized LRU Cache implementation (for AGAS)
- PR #1983⁴⁸³⁵ - Avoid invoking migration table look up for all objects

2.10. Releases

1727

- PR #1956⁴⁸⁵⁹ - Sort by key example
- PR #1955⁴⁸⁶⁰ - Adding regression test for #1946: Hang in wait_all() in distributed run
- Issue #1954⁴⁸⁶¹ - HPX releases should not use -Werror
- PR #1953⁴⁸⁶² - Adding performance analysis for AGAS cache
- PR #1952⁴⁸⁶³ - Adapting test for explicit variadics to fail for gcc 4.6
- PR #1951⁴⁸⁶⁴ - Fixing memory leak
- Issue #1950⁴⁸⁶⁵ - Simplify external builds
- PR #1949⁴⁸⁶⁶ - Fixing yet another lock that is being held during suspension
- PR #1948⁴⁸⁶⁷ - Fixed container algorithms for Intel
- PR #1947⁴⁸⁶⁸ - Adding workaround for tagged_tuple
- Issue #1946⁴⁸⁶⁹ - Hang in wait_all() in distributed run
- PR #1945⁴⁸⁷⁰ - Fixed container algorithm tests
- Issue #1944⁴⁸⁷¹ - assertion ‘p.destination_locality() == hpx::get_locality()’ failed
- PR #1943⁴⁸⁷² - Fix a couple of compile errors with clang
- PR #1942⁴⁸⁷³ - Making parcel coalescing functional
- Issue #1941⁴⁸⁷⁴ - Re-enable parcel coalescing
- PR #1940⁴⁸⁷⁵ - Touching up make_future
- PR #1939⁴⁸⁷⁶ - Fixing problems in over-subscription management in the resource manager
- PR #1938⁴⁸⁷⁷ - Removing use of unified Boost.Thread header
- PR #1937⁴⁸⁷⁸ - Cleaning up the use of Boost.Accumulator headers
- PR #1936⁴⁸⁷⁹ - Making sure interval timer is started for aggregating performance counters
- PR #1935⁴⁸⁸⁰ - Tagged results
- PR #1934⁴⁸⁸¹ - Fix remote async with deferred launch policy

- Issue #1933⁴⁸⁸² - Floating point exception in `statistics_counter<boost::accumulators::tag::mean>::get_counter_value`
- PR #1932⁴⁸⁸³ - Removing superfluous includes of boost/lockfree/detail/branch_hints.hpp
- PR #1931⁴⁸⁸⁴ - fix compilation with clang 3.8.0
- Issue #1930⁴⁸⁸⁵ - Missing online documentation for HPX 0.9.11
- PR #1929⁴⁸⁸⁶ - LWG2485: get() should be overloaded for const tuple&&
- PR #1928⁴⁸⁸⁷ - Revert “Using ninja for circle-ci builds”
- PR #1927⁴⁸⁸⁸ - Using ninja for circle-ci builds
- PR #1926⁴⁸⁸⁹ - Fixing serialization of std::array
- Issue #1925⁴⁸⁹⁰ - Issues with static HPX libraries
- Issue #1924⁴⁸⁹¹ - Performance degrading over time
- Issue #1923⁴⁸⁹² - serialization of std::array appears broken in latest commit
- PR #1922⁴⁸⁹³ - Container algorithms
- PR #1921⁴⁸⁹⁴ - Tons of smaller quality improvements
- Issue #1920⁴⁸⁹⁵ - Seg fault in hpx::serialization::output_archive::add_gid when running octotiger
- Issue #1919⁴⁸⁹⁶ - Intel 15 compiler bug preventing HPX build
- PR #1918⁴⁸⁹⁷ - Address sanitizer fixes
- PR #1917⁴⁸⁹⁸ - Fixing compilation problems of parallel::sort with Intel compilers
- PR #1916⁴⁸⁹⁹ - Making sure code compiles if HPX_WITH_HWLOC=Off
- Issue #1915⁴⁹⁰⁰ - max_cores undefined if HPX_WITH_HWLOC=Off
- PR #1913⁴⁹⁰¹ - Add utility member functions for partitioned_vector
- PR #1912⁴⁹⁰² - Adding support for invoking actions to dataflow
- PR #1911⁴⁹⁰³ - Adding first batch of container algorithms
- PR #1910⁴⁹⁰⁴ - Keep cmake_module_path

HPX V0.9.11 (Nov 11, 2015)

Our main focus for this release was the design and development of a coherent set of higher-level APIs exposing various types of parallelism to the application programmer. We introduced the concepts of an `executor`, which can be used to customize the `where` and `when` of execution of tasks in the context of parallelizing codes. We extended all APIs related to managing parallel tasks to support executors which gives the user the choice of either using one of the predefined executor types or to provide its own, possibly application specific, executor. We paid very close attention to align all of these changes with the existing C++ Standards documents or with the ongoing proposals for standardization.

This release is the first after our change to a new development policy. We switched all development to be strictly performed on branches only, all direct commits to our main branch (`master`) are prohibited. Any change has to go through a peer review before it will be merged to `master`. As a result the overall stability of our code base has significantly increased, the development process itself has been simplified. This change manifests itself in a large number of pull-requests which have been merged (please see below for a full list of closed issues and pull-requests). All in all for this release, we closed almost 100 issues and merged over 290 pull-requests. There have been over 1600 commits to the `master` branch since the last release.

⁴⁹⁸⁷ <https://github.com/STELLAR-GROUP/hpx/issues/55>

General changes

- We are moving into the direction of unifying managed and simple components. As such, the classes `hpx::components::component` and `hpx::components::component_base` have been added which currently just forward to the currently existing simple component facilities. The examples have been converted to only use those two classes.
- Added integration with the CircleCI⁴⁹⁸⁸ hosted continuous integration service. This gives us constant and immediate feedback on the health of our master branch.
- The compiler configuration subsystem in the build system has been reimplemented. Instead of using Boost.Config we now use our own lightweight set of cmake scripts to determine the available language and library features supported by the used compiler.
- The API for creating instances of components has been consolidated. All component instances should be created using the `hpx::new_` only. It allows one to instantiate both, single component instances and multiple component instances. The placement of the created components can be controlled by special distribution policies. Please see the corresponding documentation outlining the use of `hpx::new_`.
- Introduced four new distribution policies which can be used with many API functions which traditionally expected to be used with a locality id. The new distribution policies are:
 - `hpx::components::default_distribution_policy` which tries to place multiple component instances as evenly as possible.
 - `hpx::components::colocating_distribution_policy` which will refer to the locality where a given component instance is currently placed.
 - `hpx::components::binpacking_distribution_policy` which will place multiple component instances as evenly as possible based on any performance counter.
 - `hpx::components::target_distribution_policy` which allows one to represent a given locality in the context of a distribution policy.
- The new distribution policies can now be also used with `hpx::async`. This change also deprecates `hpx::async_colocated(id, ...)` which now is replaced by a distribution policy: `hpx::async(hpx::colocated(id), ...)`.
- The `hpx::vector` and `hpx::unordered_map` data structures can now be used with the new distribution policies as well.
- The parallel facility `hpx::parallel::task_region` has been renamed to `hpx::parallel::task_block` based on the changes in the corresponding standardization proposal N4411⁴⁹⁸⁹.
- Added extensions to the parallel facility `hpx::parallel::task_block` allowing to combine a task_block with an execution policy. This implies a minor breaking change as the `hpx::parallel::task_block` is now a template.
- Added new LCOs: `hpx::lcos::latch` and `hpx::lcos::local::latch` which semantically conform to the proposed `std::latch` (see N4399⁴⁹⁹⁰).
- Added performance counters exposing data related to data transferred by input/output (filesystem) operations (thanks to Maciej Brodowicz).
- Added performance counters allowing to track the number of action invocations (local and remote invocations).
- Added new command line options `-hpx:print-counter-at` and `-hpx:reset-counters`.

⁴⁹⁸⁸ <https://circleci.com/gh/STELLAR-GROUP/hpx>

⁴⁹⁸⁹ <http://wg21.link/n4411>

⁴⁹⁹⁰ <http://wg21.link/n4399>

- The `hpx::vector` component has been renamed to `hpx::partitioned_vector` to make it explicit that the underlying memory is not contiguous.
- Introduced a completely new and uniform higher-level parallelism API which is based on executors. All existing parallelism APIs have been adapted to this. We have added a large number of different executor types, such as a numa-aware executor, a this-thread executor, etc.
- Added support for the MingW toolchain on Windows (thanks to Eric Lemanissier).
- HPX now includes support for APEX, (Autonomic Performance Environment for eXascale). APEX is an instrumentation and software adaptation library that provides an interface to TAU profiling / tracing as well as runtime adaptation of HPX applications through policy definitions. For more information and documentation, please see <https://github.com/UO-OACISS/xpress-apex>. To enable APEX at configuration time, specify `-DHPX_WITH_APEX=On`. To also include support for TAU profiling, specify `-DHPX_WITH_TAU=On` and specify the `-DTAU_ROOT`, `-DTAU_ARCH` and `-DTAU_OPTIONS` cmake parameters.
- We have implemented many more of the *Using parallel algorithms*. Please see Issue #1141⁴⁹⁹¹ for the list of all available parallel algorithms (thanks to Daniel Bourgeois and John Biddiscombe for contributing their work).

Breaking changes

- We are moving into the direction of unifying managed and simple components. In order to stop exposing the old facilities, all examples have been converted to use the new classes. The breaking change in this release is that performance counters are now a `hpx::components::component_base` instead of `hpx::components::managed_component_base`.
- We removed the support for stackless threads. It turned out that there was no performance benefit when using stackless threads. As such, we decided to clean up our codebase. This feature was not documented.
- The CMake project name has changed from ‘hpx’ to ‘HPX’ for consistency and compatibility with naming conventions and other CMake projects. Generated config files go into `<prefix>/lib/cmake/HPX` and not `<prefix>/lib/cmake/hpx`.
- The macro `HPX_REGISTER_MINIMAL_COMPONENT_FACTORY` has been deprecated. Please use `HPX_REGISTER_COMPONENT` instead. The old macro will be removed in the next release.
- The obsolete distributing_factory and binpacking_factory components have been removed. The corresponding functionality is now provided by the `hpx::new_` API function in conjunction with the `hpx::default_layout` and `hpx::binpacking` distribution policies (`hpx::components::default_distribution_policy` and `hpx::components::binpacking_distribution_policy`)
- The API function `hpx::new_colocated` has been deprecated. Please use the consolidated API `hpx::new_` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of *HPX* if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The API function `hpx::async_colocated` has been deprecated. Please use the consolidated API `hpx::async` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of *HPX* if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The obsolete remote_object component has been removed.

⁴⁹⁹¹ <https://github.com/STELLAR-GROUP/hpx/issues/1141>

- Replaced the use of Boost.Serialization with our own solution. While the new version is mostly compatible with Boost.Serialization, this change requires some minor code modifications in user code. For more information, please see the corresponding announcement⁴⁹⁹² on the hpx-users@stellar.cct.lsu.edu mailing list.
- The names used by cmake to influence various configuration options have been unified. The new naming scheme relies on all configuration constants to start with `HPX_WITH_...`, while the preprocessor constant which is used at build time starts with `HPX_HAVE_...`. For instance, the former cmake command line `-DHPX_MALLOC=...` now has to be specified a `-DHPX_WITH_MALLOC=...` and will cause the preprocessor constant `HPX_HAVE_MALLOC` to be defined. The actual name of the constant (i.e. `MALLOC`) has not changed. Please see the corresponding documentation for more details ([CMake options](#)).
- The `get_gid()` functions exposed by the component base classes `hpx::components::server::simple_component_base`, `hpx::components::server::managed_component_base`, and `hpx::components::server::fixed_component_base` have been replaced by two new functions: `get_unmanaged_id()` and `get_id()`. To enable the old function name for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.
- All functions which were named `get_gid()` but were returning `hpx::id_type` have been renamed to `get_id()`. To enable the old function names for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #1855⁴⁹⁹³ - Completely removing external/endian
- PR #1854⁴⁹⁹⁴ - Don't pollute CMAKE_CXX_FLAGS through find_package()
- PR #1853⁴⁹⁹⁵ - Updating CMake configuration to get correct version of TAU library
- PR #1852⁴⁹⁹⁶ - Fixing Performance Problems with MPI Parcelport

⁵⁰²⁷ <https://github.com/STELLAR-GROUP/hpx/pull/1816>

- PR #1814⁵⁰²⁸ - Fix async to dispatch to the correct locality in all cases
- Issue #1813⁵⁰²⁹ - `async(launch::..., action(), ...)` always invokes locally
- PR #1812⁵⁰³⁰ - fixed syntax error in CMakeLists.txt
- PR #1811⁵⁰³¹ - Agas optimizations
- PR #1810⁵⁰³² - drop superfluous typedefs
- PR #1809⁵⁰³³ - Allow HPX to be used as an optional package in 3rd party code
- PR #1808⁵⁰³⁴ - Fixing #1723
- PR #1807⁵⁰³⁵ - Making sure resolve_localities does not hang during normal operation
- Issue #1806⁵⁰³⁶ - Spinlock no longer movable and deletes operator '=' , breaks MiniGhost
- Issue #1804⁵⁰³⁷ - register_with_basename causes hangs
- PR #1801⁵⁰³⁸ - Enhanced the inspect tool to take user directly to the problem with hyperlinks
- Issue #1800⁵⁰³⁹ - Problems compiling application on smic
- PR #1799⁵⁰⁴⁰ - Fixing cv exceptions
- PR #1798⁵⁰⁴¹ - Documentation refactoring & updating
- PR #1797⁵⁰⁴² - Updating the activeharmony CMake module
- PR #1795⁵⁰⁴³ - Fixing cv
- PR #1794⁵⁰⁴⁴ - Fix connect with `hpx::runtime_mode_connect`
- PR #1793⁵⁰⁴⁵ - fix a wrong use of `HPX_MAX_CPU_COUNT` instead of `HPX_HAVE_MAX_CPU_COUNT`
- PR #1792⁵⁰⁴⁶ - Allow for default constructed parcel instances to be moved
- PR #1791⁵⁰⁴⁷ - Fix connect with `hpx::runtime_mode_connect`
- Issue #1790⁵⁰⁴⁸ - assertion `action_.get()` failed: `HPX(assertion_failure)` when running Octotiger with pull request 1786
- PR #1789⁵⁰⁴⁹ - Fixing discover_counter_types API function
- Issue #1788⁵⁰⁵⁰ - connect with `hpx::runtime_mode_connect`

- Issue #1787⁵⁰⁵¹ - discover_counter_types not working
- PR #1786⁵⁰⁵² - Changing addressing_service to use std::unordered_map instead of std::map
- PR #1785⁵⁰⁵³ - Fix is_iterator for container algorithms
- PR #1784⁵⁰⁵⁴ - Adding new command line options:
- PR #1783⁵⁰⁵⁵ - Minor changes for APEX support
- PR #1782⁵⁰⁵⁶ - Drop legacy forwarding action traits
- PR #1781⁵⁰⁵⁷ - Attempt to resolve the race between cv::wait_xxx and cv::notify_all
- PR #1780⁵⁰⁵⁸ - Removing serialize_sequence
- PR #1779⁵⁰⁵⁹ - Fixed #1501: hwloc configuration options are wrong for MIC
- PR #1778⁵⁰⁶⁰ - Removing ability to enable/disable parcel handling
- PR #1777⁵⁰⁶¹ - Completely removing stackless threads
- PR #1776⁵⁰⁶² - Cleaning up util/plugin
- PR #1775⁵⁰⁶³ - Agas fixes
- PR #1774⁵⁰⁶⁴ - Action invocation count
- PR #1773⁵⁰⁶⁵ - replaced MSVC variable with WIN32
- PR #1772⁵⁰⁶⁶ - Fixing Problems in MPI parcelport and future serialization.
- PR #1771⁵⁰⁶⁷ - Fixing intel 13 compiler errors related to variadic template template parameters for lcos::when_tests
- PR #1770⁵⁰⁶⁸ - Forwarding decay to std:::
- PR #1769⁵⁰⁶⁹ - Add more characters with special regex meaning to the existing patch
- PR #1768⁵⁰⁷⁰ - Adding test for receive_buffer
- PR #1767⁵⁰⁷¹ - Making sure that uptime counter throws exception on any attempt to be reset
- PR #1766⁵⁰⁷² - Cleaning up code related to throttling scheduler
- PR #1765⁵⁰⁷³ - Restricting thread_data to creating only with intrusive_pointers

- PR #1639⁵¹⁸⁹ - Re-apply remaining changes from limit_dataflow_recursion branch
- PR #1638⁵¹⁹⁰ - This fixes possible deadlock in the test ignore_while_locked_1485
- PR #1637⁵¹⁹¹ - Fixing hpx::wait_all() invoked with two vector<future<T>>
- PR #1636⁵¹⁹² - Partially re-apply changes from limit_dataflow_recursion branch
- PR #1635⁵¹⁹³ - Adding missing test for #1572
- PR #1634⁵¹⁹⁴ - Revert “Limit recursion-depth in dataflow to a configurable constant”
- PR #1633⁵¹⁹⁵ - Add command line option to ignore batch environment
- PR #1631⁵¹⁹⁶ - hpx::lcos::queue exhibits strange behavior
- PR #1630⁵¹⁹⁷ - Fixed endline_whitespace_check.cpp to detect lines with only whitespace
- Issue #1629⁵¹⁹⁸ - Inspect trailing whitespace checker problem
- PR #1628⁵¹⁹⁹ - Removed meaningless const qualifiers. Minor icpc fix.
- PR #1627⁵²⁰⁰ - Fixing the queue LCO and add example demonstrating its use
- PR #1626⁵²⁰¹ - Deprecating get_gid(), add get_id() and get_unmanaged_id()
- PR #1625⁵²⁰² - Allowing to specify whether to send credits along with message
- Issue #1624⁵²⁰³ - Lifetime issue
- Issue #1623⁵²⁰⁴ - hpx::wait_all() invoked with two vector<future<T>> fails
- PR #1622⁵²⁰⁵ - Executor partitioners
- PR #1621⁵²⁰⁶ - Clean up coroutines implementation
- Issue #1620⁵²⁰⁷ - Revert #1535
- PR #1619⁵²⁰⁸ - Fix result type calculation for hpx::make_continuation
- PR #1618⁵²⁰⁹ - Fixing RDTSC on Xeon/Phi
- Issue #1617⁵²¹⁰ - hpx cmake not working when run as a subproject
- Issue #1616⁵²¹¹ - cmake problem resulting in RDTSC not working correctly for Xeon Phi creates very strange results for duration counters

- Issue #524⁵³⁹⁶ - Extend scheduler to support threads which can't be stolen

HPX V0.9.10 (Mar 24, 2015)

General changes

This is the 12th official release of *HPX*. It coincides with the 7th anniversary of the first commit to our source code repository. Since then, we have seen over 12300 commits amounting to more than 220000 lines of C++ code.

The major focus of this release was to improve the reliability of large scale runs. We believe to have achieved this goal as we now can reliably run *HPX* applications on up to ~24k cores. We have also shown that *HPX* can be used with success for symmetric runs (applications using both, host cores and Intel Xeon/Phi coprocessors). This is a huge step forward in terms of the usability of *HPX*. The main focus of this work involved isolating the causes of the segmentation faults at start up and shut down. Many of these issues were discovered to be the result of the suspension of threads which hold locks.

A very important improvement introduced with this release is the refactoring of the code representing our parcel-port implementation. Parcel- ports can now be implemented by 3rd parties as independent plugins which are dynamically loaded at runtime (static linking of parcel-ports is also supported). This refactoring also includes a massive improvement of the performance of our existing parcel-ports. We were able to significantly reduce the networking latencies and to improve the available networking bandwidth. Please note that in this release we disabled the ibverbs and ipc parcel ports as those have not been ported to the new plugin system yet (see Issue #839⁵³⁹⁷).

Another corner stone of this release is our work towards a complete implementation of __cpp11_n4104__ (Working Draft, Technical Specification for C++ Extensions for Parallelism). This document defines a set of parallel algorithms to be added to the C++ standard library. We now have implemented about 75% of all specified parallel algorithms (see [link hpx.manual.parallel.parallel_algorithms Parallel Algorithms] for more details). We also implemented some extensions to __cpp11_n4104__ allowing to invoke all of the algorithms asynchronously.

This release adds a first implementation of `hpx::vector` which is a distributed data structure closely aligned to the functionality of `std::vector`. The difference is that `hpx::vector` stores the data in partitions where the partitions can be distributed over different localities. We started to work on allowing to use the parallel algorithms with `hpx::vector`. At this point we have implemented only a few of the parallel algorithms to support distributed data structures (like `hpx::vector`) for testing purposes (see Issue #1338⁵³⁹⁸ for a documentation of our progress).

Breaking changes

With this release we put a lot of effort into changing the code base to be more compatible to C++11. These changes have caused the following issues for backward compatibility:

- Move to Variadics- All of the API now uses variadic templates. However, this change required to modify the argument sequence for some of the exiting API functions (`hpx::async_continue`, `hpx::apply_continue`, `hpx::when_each`, `hpx::wait_each`, synchronous invocation of actions).
- Changes to Macros- We also removed the macros `HPX_STD_FUNCTION` and `HPX_STD_TUPLE`. This shouldn't affect any user code as we replaced `HPX_STD_FUNCTION` with `hpx::util::function_nonser` which was the default expansion used for this macro. All *HPX* API functions which expect a `hpx::util::function_nonser` (or a `hpx::util::unique_function_nonser`) can now be transparently called with a compatible `std::function` instead. Similarly, `HPX_STD_TUPLE` was replaced by its default expansion as well: `hpx::util::tuple`.

⁵³⁹⁶ <https://github.com/STELLAR-GROUP/hpx/issues/524>

⁵³⁹⁷ <https://github.com/STELLAR-GROUP/hpx/issues/839>

⁵³⁹⁸ <https://github.com/STELLAR-GROUP/hpx/issues/1338>

- Changes to `hpx::unique_future`- `hpx::unique_future`, which was deprecated in the previous release for `hpx::future` is now completely removed from HPX. This completes the transition to a completely standards conforming implementation of `hpx::future`.
- Changes to Supported Compilers. Finally, in order to utilize more C++11 semantics, we have officially dropped support for GCC 4.4 and MSVC 2012. Please see our [Prerequisites](#) page for more details.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1402⁵³⁹⁹ - Internal shared_future serialization copies
- Issue #1399⁵⁴⁰⁰ - Build takes unusually long time...
- Issue #1398⁵⁴⁰¹ - Tests using the scan partitioner are broken on at least gcc 4.7 and intel compiler
- Issue #1397⁵⁴⁰² - Completely remove `hpx::unique_future`
- Issue #1396⁵⁴⁰³ - Parallel scan algorithms with different initial values
- Issue #1395⁵⁴⁰⁴ - Race Condition - 1d_stencil_8 - SuperMIC
- Issue #1394⁵⁴⁰⁵ - “suspending thread while at least one lock is being held” - 1d_stencil_8 - SuperMIC
- Issue #1393⁵⁴⁰⁶ - SEGFAULT in 1d_stencil_8 on SuperMIC
- Issue #1392⁵⁴⁰⁷ - Fixing #1168
- Issue #1391⁵⁴⁰⁸ - Parallel Algorithms for scan partitioner for small number of elements
- Issue #1387⁵⁴⁰⁹ - Failure with more than 4 localities
- Issue #1386⁵⁴¹⁰ - Dispatching unhandled exceptions to outer user code
- Issue #1385⁵⁴¹¹ - Adding Copy algorithms, fixing `parallel::copy_if`
- Issue #1384⁵⁴¹² - Fixing 1325
- Issue #1383⁵⁴¹³ - Fixed #504: Refactor Dataflow LCO to work with futures, this removes the dataflow component as it is obsolete
- Issue #1382⁵⁴¹⁴ - `is_sorted`, `is_sorted_until` and `is_partitioned` algorithms
- Issue #1381⁵⁴¹⁵ - fix for CMake versions prior to 3.1
- Issue #1380⁵⁴¹⁶ - resolved warning in CMake 3.1 and newer

2.10. Releases

1757

- Issue #1332⁵⁴⁶³ - Variadic templates support for actions
- Issue #1331⁵⁴⁶⁴ - Some ambiguous calls of map::erase have been prevented by adding additional check in locality constructor.
- Issue #1330⁵⁴⁶⁵ - Defining Plain Actions does not work as described in the documentation
- Issue #1329⁵⁴⁶⁶ - Distributed vector cleanup
- Issue #1328⁵⁴⁶⁷ - Sync docs and comments with code in hello_world example
- Issue #1327⁵⁴⁶⁸ - Typos in docs
- Issue #1326⁵⁴⁶⁹ - Documentation and code diverged in Fibonacci tutorial
- Issue #1325⁵⁴⁷⁰ - Exceptions thrown during parcel handling are not handled correctly
- Issue #1324⁵⁴⁷¹ - fixed bandwidth calculation
- Issue #1323⁵⁴⁷² - mmap() failed to allocate thread stack due to insufficient resources
- Issue #1322⁵⁴⁷³ - HPX fails to build aa182cf
- Issue #1321⁵⁴⁷⁴ - Limiting size of outgoing messages while coalescing parcels
- Issue #1320⁵⁴⁷⁵ - passing a future with launch::deferred in remote function call causes hang
- Issue #1319⁵⁴⁷⁶ - An exception when tries to specify number high priority threads with abp-priority
- Issue #1318⁵⁴⁷⁷ - Unable to run program with abp-priority and numa-sensitivity enabled
- Issue #1317⁵⁴⁷⁸ - N4071 Search/Search_n finished, minor changes
- Issue #1316⁵⁴⁷⁹ - Add config option to make -Ihpx.run_hpx_main!=1 the default
- Issue #1314⁵⁴⁸⁰ - Variadic support for async and apply
- Issue #1313⁵⁴⁸¹ - Adjust when_any/some to the latest proposed interfaces
- Issue #1312⁵⁴⁸² - Fixing #857: hpx::naming::locality leaks parcelport specific information into the public interface
- Issue #1311⁵⁴⁸³ - Distributed get'er/set'er_values for distributed vector
- Issue #1310⁵⁴⁸⁴ - Crashing in hpx::parcelset::policies::mpi::connection_handler::handle_messages() on Super-MIC

- Issue #680⁵⁵⁰⁸ - Convert parcel ports into a plugin system
- Issue #582⁵⁵⁰⁹ - Make exception thrown from HPX threads available from `hpx::init`
- Issue #504⁵⁵¹⁰ - Refactor Dataflow LCO to work with futures
- Issue #196⁵⁵¹¹ - Don't store copies of the locality network metadata in the gva table

HPX V0.9.9 (Oct 31, 2014, codename Spooky)

General changes

We have had over 1500 commits since the last release and we have closed over 200 tickets (bugs, feature requests, pull requests, etc.). These are by far the largest numbers of commits and resolved issues for any of the *HPX* releases so far. We are especially happy about the large number of people who contributed for the first time to *HPX*.

- We completed the transition from the older (non-conforming) implementation of `hpx::future` to the new and fully conforming version by removing the old code and by renaming the type `hpx::unique_future` to `hpx::future`. In order to maintain backwards compatibility with existing code which uses the type `hpx::unique_future` we support the configuration variable `HPX_UNIQUE_FUTURE_ALIAS`. If this variable is set to ON while running cmake it will additionally define a template alias for this type.
- We rewrote and significantly changed our build system. Please have a look at the new (now generated) documentation here: [Building HPX](#). Please revisit your build scripts to adapt to the changes. The most notable changes are:
 - `HPX_NO_INSTALL` is no longer necessary.
 - For external builds, you need to set `HPX_DIR` instead of `HPX_ROOT` as described here: [Using HPX with CMake-based projects](#).
 - IDEs that support multiple configurations (Visual Studio and XCode) can now be used as intended. that means no build dir.
 - Building HPX statically (without dynamic libraries) is now supported (`-DHPX_STATIC_LINKING=On`).
 - Please note that many variables used to configure the build process have been renamed to unify the naming conventions (see the section [CMake options](#) for more information).
 - This also fixes a long list of issues, for more information see [Issue #1204⁵⁵¹²](#).
- We started to implement various proposals to the C++ Standardization committee related to parallelism and concurrency, most notably [N4409⁵⁵¹³](#) (Working Draft, Technical Specification for C++ Extensions for Parallelism), [N4411⁵⁵¹⁴](#) (Task Region Rev. 3), and [N4313⁵⁵¹⁵](#) (Working Draft, Technical Specification for C++ Extensions for Concurrency).
- We completely remodeled our automatic build system to run builds and unit tests on various systems and compilers. This allows us to find most bugs right as they were introduced and helps to maintain a high level of quality and compatibility. The newest build logs can be found at [HPX Buildbot Website⁵⁵¹⁶](#).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1296⁵⁵¹⁷ - Rename make_error_future to make_exceptional_future, adjust to N4123
- Issue #1295⁵⁵¹⁸ - building issue
- Issue #1293⁵⁵¹⁹ - Transpose example
- Issue #1292⁵⁵²⁰ - Wrong abs() function used in example
- Issue #1291⁵⁵²¹ - non-synchronized shift operators have been removed
- Issue #1290⁵⁵²² - RDTSCP is defined as true for Xeon Phi build
- Issue #1289⁵⁵²³ - Fixing 1288
- Issue #1288⁵⁵²⁴ - Add new performance counters
- Issue #1287⁵⁵²⁵ - Hierarchy scheduler broken performance counters
- Issue #1286⁵⁵²⁶ - Algorithm cleanup
- Issue #1285⁵⁵²⁷ - Broken Links in Documentation
- Issue #1284⁵⁵²⁸ - Uninitialized copy
- Issue #1283⁵⁵²⁹ - missing boost::scoped_ptr includes
- Issue #1282⁵⁵³⁰ - Update documentation of build options for schedulers
- Issue #1281⁵⁵³¹ - reset idle rate counter
- Issue #1280⁵⁵³² - Bug when executing on Intel MIC
- Issue #1279⁵⁵³³ - Add improved when_all/wait_all
- Issue #1278⁵⁵³⁴ - Implement improved when_all/wait_all
- Issue #1277⁵⁵³⁵ - feature request: get access to argc argv and variables_map
- Issue #1276⁵⁵³⁶ - Remove merging map
- Issue #1274⁵⁵³⁷ - Weird (wrong) string code in papi.cpp

⁵⁵³⁷ <https://github.com/STELLAR-GROUP/hpx/issues/1274>

- Issue #1273⁵⁵³⁸ - Sequential task execution policy
- Issue #1272⁵⁵³⁹ - Avoid CMake name clash for Boost.Thread library
- Issue #1271⁵⁵⁴⁰ - Updates on HPX Test Units
- Issue #1270⁵⁵⁴¹ - hpx/util/safe_lexical_cast.hpp is added
- Issue #1269⁵⁵⁴² - Added default value for “LIB” cmake variable
- Issue #1268⁵⁵⁴³ - Memory Counters not working
- Issue #1266⁵⁵⁴⁴ - FindHPX.cmake is not installed
- Issue #1263⁵⁵⁴⁵ - apply_remote test takes too long
- Issue #1262⁵⁵⁴⁶ - Chrono cleanup
- Issue #1261⁵⁵⁴⁷ - Need make install for papi counters and this builds all the examples
- Issue #1260⁵⁵⁴⁸ - Documentation of Stencil example claims
- Issue #1259⁵⁵⁴⁹ - Avoid double-linking Boost on Windows
- Issue #1257⁵⁵⁵⁰ - Adding additional parameter to create_thread
- Issue #1256⁵⁵⁵¹ - added buildbot changes to release notes
- Issue #1255⁵⁵⁵² - Cannot build MiniGhost
- Issue #1253⁵⁵⁵³ - hpx::thread defects
- Issue #1252⁵⁵⁵⁴ - HPX_PREFIX is too fragile
- Issue #1250⁵⁵⁵⁵ - switch_to_fiber_emulation does not work properly
- Issue #1249⁵⁵⁵⁶ - Documentation is generated under Release folder
- Issue #1248⁵⁵⁵⁷ - Fix usage of hpx_generic_coroutine_context and get tests passing on powerpc
- Issue #1247⁵⁵⁵⁸ - Dynamic linking error
- Issue #1246⁵⁵⁵⁹ - Make cpuid.cpp C++11 compliant
- Issue #1245⁵⁵⁶⁰ - HPX fails on startup (setting thread affinity mask)

- Issue #1244⁵⁵⁶¹ - HPX_WITH_RDTSC configure test fails, but should succeed
- Issue #1243⁵⁵⁶² - CTest dashboard info for CSCS CDash drop location
- Issue #1242⁵⁵⁶³ - Mac fixes
- Issue #1241⁵⁵⁶⁴ - Failure in Distributed with Boost 1.56
- Issue #1240⁵⁵⁶⁵ - fix a race condition in examples.diskperf
- Issue #1239⁵⁵⁶⁶ - fix wait_each in examples.diskperf
- Issue #1238⁵⁵⁶⁷ - Fixed #1237: hpx::util::portable_binary_iarchive failed
- Issue #1237⁵⁵⁶⁸ - hpx::util::portable_binary_iarchive faileds
- Issue #1235⁵⁵⁶⁹ - Fixing clang warnings and errors
- Issue #1234⁵⁵⁷⁰ - TCP runs fail: Transport endpoint is not connected
- Issue #1233⁵⁵⁷¹ - Making sure the correct number of threads is registered with AGAS
- Issue #1232⁵⁵⁷² - Fixing race in wait_xxx
- Issue #1231⁵⁵⁷³ - Parallel minmax
- Issue #1230⁵⁵⁷⁴ - Distributed run of 1d_stencil_8 uses less threads than spec. & sometimes gives errors
- Issue #1229⁵⁵⁷⁵ - Unstable number of threads
- Issue #1228⁵⁵⁷⁶ - HPX link error (cmake / MPI)
- Issue #1226⁵⁵⁷⁷ - Warning about struct/class thread_counters
- Issue #1225⁵⁵⁷⁸ - Adding parallel::replace etc
- Issue #1224⁵⁵⁷⁹ - Extending dataflow to pass through non-future arguments
- Issue #1223⁵⁵⁸⁰ - Remaining find algorithms implemented, N4071
- Issue #1222⁵⁵⁸¹ - Merging all the changes
- Issue #1221⁵⁵⁸² - No error output when using mpirun with hpx
- Issue #1219⁵⁵⁸³ - Adding new AGAS cache performance counters

⁵⁵⁸³ <https://github.com/STELLAR-GROUP/hpx/issues/1219>

- Issue #1216⁵⁵⁸⁴ - Fixing using futures (clients) as arguments to actions
- Issue #1215⁵⁵⁸⁵ - Error compiling simple component
- Issue #1214⁵⁵⁸⁶ - Stencil docs
- Issue #1213⁵⁵⁸⁷ - Using more than a few dozen MPI processes on SuperMike results in a seg fault before getting to hpx_main
- Issue #1212⁵⁵⁸⁸ - Parallel rotate
- Issue #1211⁵⁵⁸⁹ - Direct actions cause the future's shared_state to be leaked
- Issue #1210⁵⁵⁹⁰ - Refactored local::promise to be standard conformant
- Issue #1209⁵⁵⁹¹ - Improve command line handling
- Issue #1208⁵⁵⁹² - Adding parallel::reverse and parallel::reverse_copy
- Issue #1207⁵⁵⁹³ - Add copy_backward and move_backward
- Issue #1206⁵⁵⁹⁴ - N4071 additional algorithms implemented
- Issue #1204⁵⁵⁹⁵ - Cmake simplification and various other minor changes
- Issue #1203⁵⁵⁹⁶ - Implementing new launch policy for (local) async: hpx::launch::fork.
- Issue #1202⁵⁵⁹⁷ - Failed assertion in connection_cache.hpp
- Issue #1201⁵⁵⁹⁸ - pkg-config doesn't add mpi link directories
- Issue #1200⁵⁵⁹⁹ - Error when querying time performance counters
- Issue #1199⁵⁶⁰⁰ - library path is now configurable (again)
- Issue #1198⁵⁶⁰¹ - Error when querying performance counters
- Issue #1197⁵⁶⁰² - tests fail with intel compiler
- Issue #1196⁵⁶⁰³ - Silence several warnings
- Issue #1195⁵⁶⁰⁴ - Rephrase initializers to work with VC++ 2012
- Issue #1194⁵⁶⁰⁵ - Simplify parallel algorithms
- Issue #1193⁵⁶⁰⁶ - Adding parallel::equal

⁵⁶⁰⁶ <https://github.com/STELLAR-GROUP/hpx/issues/1193>

- Issue #1192⁵⁶⁰⁷ - HPX(out_of_memory) on including <hpx/hpx.hpp>
- Issue #1191⁵⁶⁰⁸ - Fixing #1189
- Issue #1190⁵⁶⁰⁹ - Chrono cleanup
- Issue #1189⁵⁶¹⁰ - Deadlock .. somewhere? (probably serialization)
- Issue #1188⁵⁶¹¹ - Removed `future::get_status()`
- Issue #1186⁵⁶¹² - Fixed FindOpenCL to find current AMD APP SDK
- Issue #1184⁵⁶¹³ - Tweaking future unwrapping
- Issue #1183⁵⁶¹⁴ - Extended `parallel::reduce`
- Issue #1182⁵⁶¹⁵ - `future::unwrap` hangs for `launch::deferred`
- Issue #1181⁵⁶¹⁶ - Adding `all_of`, `any_of`, and `none_of` and corresponding documentation
- Issue #1180⁵⁶¹⁷ - `hpx::cout` defect
- Issue #1179⁵⁶¹⁸ - `hpx::async` does not work for member function pointers when called on types with self-defined unary `operator*`
- Issue #1178⁵⁶¹⁹ - Implemented variadic `hpx::util::zip_iterator`
- Issue #1177⁵⁶²⁰ - MPI parcelport defect
- Issue #1176⁵⁶²¹ - `HPX_DEFINE_COMPONENT_CONST_ACTION_TPL` does not have a 2-argument version
- Issue #1175⁵⁶²² - Create `util::zip_iterator` working with `util::tuple<>`
- Issue #1174⁵⁶²³ - Error Building HPX on linux, `root_certificate_authority.cpp`
- Issue #1173⁵⁶²⁴ - `hpx::cout` output lost
- Issue #1172⁵⁶²⁵ - HPX build error with Clang 3.4.2
- Issue #1171⁵⁶²⁶ - `CMAKE_INSTALL_PREFIX` ignored
- Issue #1170⁵⁶²⁷ - Close `hpx_benchmarks` repository on Github
- Issue #1169⁵⁶²⁸ - Buildbot emails have syntax error in url
- Issue #1167⁵⁶²⁹ - Merge partial implementation of standards proposal N3960

HPX V0.9.8 (Mar 24, 2014)

We have had over 800 commits since the last release and we have closed over 65 tickets (bugs, feature requests, etc.).

With the changes below, *HPX* is once again leading the charge of a whole new era of computation. By intrinsically breaking down and synchronizing the work to be done, *HPX* insures that application developers will no longer have to fret about where a segment of code executes. That allows coders to focus their time and energy to understanding the data dependencies of their algorithms and thereby the core obstacles to an efficient code. Here are some of the advantages of using *HPX*:

- *HPX* is solidly rooted in a sophisticated theoretical execution model – ParalleX
- *HPX* exposes an API fully conforming to the C++11 and the draft C++14 standards, extended and applied to distributed computing. Everything programmers know about the concurrency primitives of the standard C++ library is still valid in the context of *HPX*.
- It provides a competitive, high performance implementation of modern, future-proof ideas which gives an smooth migration path from today's mainstream techniques
- There is no need for the programmer to worry about lower level parallelization paradigms like threads or message passing; no need to understand pthreads, MPI, OpenMP, or Windows threads, etc.
- There is no need to think about different types of parallelism such as tasks, pipelines, or fork-join, task or data parallelism.
- The same source of your program compiles and runs on Linux, BlueGene/Q, Mac OS X, Windows, and Android.
- The same code runs on shared memory multi-core systems and supercomputers, on handheld devices and Intel® Xeon Phi™ accelerators, or a heterogeneous mix of those.

General changes

- A major API breaking change for this release was introduced by implementing `hpx::future` and `hpx::shared_future` fully in conformance with the C++11 Standard⁵⁷⁴¹. While `hpx::shared_future` is new and will not create any compatibility problems, we revised the interface and implementation of the existing `hpx::future`. For more details please see the mailing list archive⁵⁷⁴². To avoid any incompatibilities for existing code we named the type which implements the `std::future` interface as `hpx::unique_future`. For the next release this will be renamed to `hpx::future`, making it full conforming to C++11 Standard⁵⁷⁴³.
- A large part of the code base of *HPX* has been refactored and partially re-implemented. The main changes were related to
 - The threading subsystem: these changes significantly reduce the amount of overheads caused by the schedulers, improve the modularity of the code base, and extend the variety of available scheduling algorithms.
 - The parcel subsystem: these changes improve the performance of the *HPX* networking layer, modularize the structure of the parcelports, and simplify the creation of new parcelports for other underlying networking libraries.
 - The API subsystem: these changes improved the conformance of the API to C++11 Standard, extend and unify the available API functionality, and decrease the overheads created by various elements of the API.
 - The robustness of the component loading subsystem has been improved significantly, allowing to more portably and more reliably register the components needed by an application as startup. This additionally speeds up general application initialization.

⁵⁷⁴¹ <http://www.open-std.org/jtc1/sc22/wg21>

⁵⁷⁴² <http://mail.cct.lsu.edu/pipermail/hpx-users/2014-January/000141.html>

⁵⁷⁴³ <http://www.open-std.org/jtc1/sc22/wg21>

- We added new API functionality like `hpx::migrate` and `hpx::copy_component` which are the basic building blocks necessary for implementing higher level abstractions for system-wide load balancing, runtime-adaptive resource management, and object-oriented checkpointing and state-management.
- We removed the use of C++11 move emulation (using Boost.Move), replacing it with C++11 rvalue references. This is the first step towards using more and more native C++11 facilities which we plan to introduce in the future.
- We improved the reference counting scheme used by *HPX* which helps managing distributed objects and memory. This improves the overall stability of *HPX* and further simplifies writing real world applications.
- The minimal Boost version required to use *HPX* is now V1.49.0.
- This release coincides with the first release of HPXPI (V0.1.0), the first implementation of the XPI specification⁵⁷⁴⁴.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1086⁵⁷⁴⁵ - Expose internal boost::shared_array to allow user management of array lifetime
- Issue #1083⁵⁷⁴⁶ - Make shell examples copyable in docs
- Issue #1080⁵⁷⁴⁷ - /threads{locality#*/total}/count/cumulative broken
- Issue #1079⁵⁷⁴⁸ - Build problems on OS X
- Issue #1078⁵⁷⁴⁹ - Improve robustness of component loading
- Issue #1077⁵⁷⁵⁰ - Fix a missing enum definition for ‘take’ mode
- Issue #1076⁵⁷⁵¹ - Merge Jb master
- Issue #1075⁵⁷⁵² - Unknown CMake command “add_hpx_pseudo_target”
- Issue #1074⁵⁷⁵³ - Implement `apply_continue_callback` and `apply_colocated_callback`
- Issue #1073⁵⁷⁵⁴ - The new `apply_colocated` and `async_colocated` functions lead to automatic registered functions
- Issue #1071⁵⁷⁵⁵ - Remove deferred_packaged_task
- Issue #1069⁵⁷⁵⁶ - serialize_buffer with allocator fails at destruction
- Issue #1068⁵⁷⁵⁷ - Coroutine include and forward declarations missing
- Issue #1067⁵⁷⁵⁸ - Add allocator support to util::serialize_buffer

- Issue #1066⁵⁷⁵⁹ - Allow for MPI_Init being called before HPX launches
- Issue #1065⁵⁷⁶⁰ - AGAS cache isn't used/populated on worker localities
- Issue #1064⁵⁷⁶¹ - Reorder includes to ensure ws2 includes early
- Issue #1063⁵⁷⁶² - Add hpx::runtime::suspend and hpx::runtime::resume
- Issue #1062⁵⁷⁶³ - Fix async_continue to properly handle return types
- Issue #1061⁵⁷⁶⁴ - Implement async_colocated and apply_colocated
- Issue #1060⁵⁷⁶⁵ - Implement minimal component migration
- Issue #1058⁵⁷⁶⁶ - Remove HPX_UTIL_TUPLE from code base
- Issue #1057⁵⁷⁶⁷ - Add performance counters for threading subsystem
- Issue #1055⁵⁷⁶⁸ - Thread allocation uses two memory pools
- Issue #1053⁵⁷⁶⁹ - Work stealing flawed
- Issue #1052⁵⁷⁷⁰ - Fix a number of warnings
- Issue #1049⁵⁷⁷¹ - Fixes for TLS on OSX and more reliable test running
- Issue #1048⁵⁷⁷² - Fixing after 588 hang
- Issue #1047⁵⁷⁷³ - Use port '0' for networking when using one locality
- Issue #1046⁵⁷⁷⁴ - composable_guard test is broken when having more than one thread
- Issue #1045⁵⁷⁷⁵ - Security missing headers
- Issue #1044⁵⁷⁷⁶ - Native TLS on FreeBSD via __thread
- Issue #1043⁵⁷⁷⁷ - async et.al. compute the wrong result type
- Issue #1042⁵⁷⁷⁸ - async et.al. implicitly unwrap reference_wrappers
- Issue #1041⁵⁷⁷⁹ - Remove redundant costly Kleene stars from regex searches
- Issue #1040⁵⁷⁸⁰ - CMake script regex match patterns has unnecessary kleenes
- Issue #1039⁵⁷⁸¹ - Remove use of Boost.Move and replace with std::move and real rvalue refs

- Issue #1012⁵⁸⁰⁶ - --hpx:debug-hpx-log and --hpx:debug-agas-log lead to non-thread safe writes
- Issue #1011⁵⁸⁰⁷ - After installation, running applications from the build/staging directory no longer works
- Issue #1010⁵⁸⁰⁸ - Mergeable decrement requests are not being merged
- Issue #1009⁵⁸⁰⁹ - --hpx:list-symbolic-names crashes
- Issue #1007⁵⁸¹⁰ - Components are not properly destroyed
- Issue #1006⁵⁸¹¹ - Segfault/hang in set_data
- Issue #1003⁵⁸¹² - Performance counter naming issue
- Issue #982⁵⁸¹³ - Race condition during startup
- Issue #912⁵⁸¹⁴ - OS X: component type not found in map
- Issue #663⁵⁸¹⁵ - Create a buildbot slave based on Clang 3.2/OSX
- Issue #636⁵⁸¹⁶ - Expose `this_locality::apply<act>(p1, p2);` for local execution
- Issue #197⁵⁸¹⁷ - Add --console=address option for PBS runs
- Issue #175⁵⁸¹⁸ - Asynchronous AGAS API

HPX V0.9.7 (Nov 13, 2013)

We have had over 1000 commits since the last release and we have closed over 180 tickets (bugs, feature requests, etc.).

General changes

- Ported HPX to BlueGene/Q
- Improved HPX support for Xeon/Phi accelerators
- Reimplemented `hpx::bind`, `hpx::tuple`, and `hpx::function` for better performance and better compliance with the C++11 Standard. Added `hpx::mem_fn`.
- Reworked `hpx::when_all` and `hpx::when_any` for better compliance with the ongoing C++ standardization effort, added heterogeneous version for those functions. Added `hpx::when_any_swapped`.
- Added `hpx::copy` as a precursor for a migrate functionality
- Added `hpx::get_ptr` allowing to directly access the memory underlying a given component
- Added the `hpx::lcos::broadcast`, `hpx::lcos::reduce`, and `hpx::lcos::fold` collective operations

⁵⁸¹⁶ <https://github.com/STELLAR-GROUP/hpx/issues/636>

⁵⁸¹⁷ <https://github.com/STELLAR-GROUP/hpx/issues/197>

⁵⁸¹⁸ <https://github.com/STELLAR-GROUP/hpx/issues/175>

- Added `hpx::get_locality_name` allowing to retrieve the name of any of the localities for the application.
- Added support for more flexible thread affinity control from the HPX command line, such as new modes for `--hpx:bind(balanced, scattered, compact)`, improved default settings when running multiple localities on the same node.
- Added experimental executors for simpler thread pooling and scheduling. This API may change in the future as it will stay aligned with the ongoing C++ standardization efforts.
- Massively improved the performance of the HPX serialization code. Added partial support for zero copy serialization of array and bitwise-copyable types.
- General performance improvements of the code related to threads and futures.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1005⁵⁸¹⁹ - Allow one to disable array optimizations and zero copy optimizations for each parcelport
- Issue #1004⁵⁸²⁰ - Generate new HPX logo image for the docs
- Issue #1002⁵⁸²¹ - If MPI parcelport is not available, running HPX under mpirun should fail
- Issue #1001⁵⁸²² - Zero copy serialization raises assert
- Issue #1000⁵⁸²³ - Can't connect to a HPX application running with the MPI parcelport from a non MPI parcelport locality
- Issue #999⁵⁸²⁴ - Optimize `hpx::when_n`
- Issue #998⁵⁸²⁵ - Fixed const-correctness
- Issue #997⁵⁸²⁶ - Making `serialize_buffer::data()` type save
- Issue #996⁵⁸²⁷ - Memory leak in `hpx::lcos::promise`
- Issue #995⁵⁸²⁸ - Race while registering pre-shutdown functions
- Issue #994⁵⁸²⁹ - `thread_rescheduling` regression test does not compile
- Issue #992⁵⁸³⁰ - Correct comments and messages
- Issue #991⁵⁸³¹ - `setcap cap_sys_rawio=ep` for power profiling causes an HPX application to abort
- Issue #989⁵⁸³² - Jacobi hangs during execution
- Issue #988⁵⁸³³ - `multiple_init` test is failing

- Issue #986⁵⁸³⁴ - Can't call a function called "init" from "main" when using <hpx/hpx_main.hpp>
- Issue #984⁵⁸³⁵ - Reference counting tests are failing
- Issue #983⁵⁸³⁶ - thread_suspension_executor test fails
- Issue #980⁵⁸³⁷ - Terminating HPX threads don't leave stack in virgin state
- Issue #979⁵⁸³⁸ - Static scheduler not in documents
- Issue #978⁵⁸³⁹ - Preprocessing limits are broken
- Issue #977⁵⁸⁴⁰ - Make tests.regressions.lcos.future_hang_on_get shorter
- Issue #976⁵⁸⁴¹ - Wrong library order in pkgconfig
- Issue #975⁵⁸⁴² - Please reopen #963
- Issue #974⁵⁸⁴³ - Option pu-offset ignored in fixing_588 branch
- Issue #972⁵⁸⁴⁴ - Cannot use MKL with HPX
- Issue #969⁵⁸⁴⁵ - Non-existent INI files requested on the command line via --hpx:config do not cause warnings or errors.
- Issue #968⁵⁸⁴⁶ - Cannot build examples in fixing_588 branch
- Issue #967⁵⁸⁴⁷ - Command line description of --hpx:queuing seems wrong
- Issue #966⁵⁸⁴⁸ - --hpx:print-bind physical core numbers are wrong
- Issue #965⁵⁸⁴⁹ - Deadlock when building in Release mode
- Issue #963⁵⁸⁵⁰ - Not all worker threads are working
- Issue #962⁵⁸⁵¹ - Problem with SLURM integration
- Issue #961⁵⁸⁵² - --hpx:print-bind outputs incorrect information
- Issue #960⁵⁸⁵³ - Fix cut and paste error in documentation of get_thread_priority
- Issue #959⁵⁸⁵⁴ - Change link to boost.atomic in documentation to point to boost.org
- Issue #958⁵⁸⁵⁵ - Undefined reference to intrusive_ptr_release
- Issue #957⁵⁸⁵⁶ - Make tuple standard compliant

⁵⁸⁵⁶ <https://github.com/STELLAR-GROUP/hpx/issues/957>

- Issue #956⁵⁸⁵⁷ - Segfault with a3382fb
- Issue #955⁵⁸⁵⁸ - --hpx:nodes and --hpx:nodenames do not work with foreign nodes
- Issue #954⁵⁸⁵⁹ - Make order of arguments for hpx::async and hpx::broadcast consistent
- Issue #953⁵⁸⁶⁰ - Cannot use MKL with HPX
- Issue #952⁵⁸⁶¹ - register_[pre_]shutdown_function never throw
- Issue #951⁵⁸⁶² - Assert when number of threads is greater than hardware concurrency
- Issue #948⁵⁸⁶³ - HPX_HAVE_GENERIC_CONTEXT_CROUTINES conflicts with HPX_HAVE_FIBER_BASED_CROUTINES
- Issue #947⁵⁸⁶⁴ - Need MPI_THREAD_MULTIPLE for backward compatibility
- Issue #946⁵⁸⁶⁵ - HPX does not call MPI_Finalize
- Issue #945⁵⁸⁶⁶ - Segfault with hpx::lcos::broadcast
- Issue #944⁵⁸⁶⁷ - OS X: assertion pu_offset_ < hardware_concurrency failed
- Issue #943⁵⁸⁶⁸ - #include <hpx/hpx_main.hpp> does not work
- Issue #942⁵⁸⁶⁹ - Make the BG/Q work with -O3
- Issue #940⁵⁸⁷⁰ - Use separator when concatenating locality name
- Issue #939⁵⁸⁷¹ - Refactor MPI parcelport to use MPI_Wait instead of multiple MPI_Test calls
- Issue #938⁵⁸⁷² - Want to officially access client_base::gid_
- Issue #937⁵⁸⁷³ - client_base::gid_ should be private``
- Issue #936⁵⁸⁷⁴ - Want doxygen-like source code index
- Issue #935⁵⁸⁷⁵ - Build error with gcc 4.6 and Boost 1.54.0 on hpx trunk and 0.9.6
- Issue #933⁵⁸⁷⁶ - Cannot build HPX with Boost 1.54.0
- Issue #932⁵⁸⁷⁷ - Components are destructed too early
- Issue #931⁵⁸⁷⁸ - Make HPX work on BG/Q
- Issue #930⁵⁸⁷⁹ - make git-docs is broken

⁵⁸⁷⁹ <https://github.com/STELLAR-GROUP/hpx/issues/930>

- Issue #929⁵⁸⁸⁰ - Generating index in docs broken
- Issue #928⁵⁸⁸¹ - Optimize hpx::util::static_ for C++11 compilers supporting magic statics
- Issue #924⁵⁸⁸² - Make kill_process_tree (in process.py) more robust on Mac OSX
- Issue #923⁵⁸⁸³ - Correct BLAS and RNPL cmake tests
- Issue #922⁵⁸⁸⁴ - Cannot link against BLAS
- Issue #921⁵⁸⁸⁵ - Implement hpx::mem_fn
- Issue #920⁵⁸⁸⁶ - Output locality with --hpx:print-bind
- Issue #919⁵⁸⁸⁷ - Correct grammar; simplify boolean expressions
- Issue #918⁵⁸⁸⁸ - Link to hello_world.cpp is broken
- Issue #917⁵⁸⁸⁹ - adapt cmake file to new boostbook version
- Issue #916⁵⁸⁹⁰ - fix problem building documentation with xsltproc >= 1.1.27
- Issue #915⁵⁸⁹¹ - Add another TBBMalloc library search path
- Issue #914⁵⁸⁹² - Build problem with Intel compiler on Stampede (TACC)
- Issue #913⁵⁸⁹³ - fix error messages in fibonacci examples
- Issue #911⁵⁸⁹⁴ - Update OS X build instructions
- Issue #910⁵⁸⁹⁵ - Want like to specify MPI_ROOT instead of compiler wrapper script
- Issue #909⁵⁸⁹⁶ - Warning about void* arithmetic
- Issue #908⁵⁸⁹⁷ - Buildbot for MIC is broken
- Issue #906⁵⁸⁹⁸ - Can't use --hpx:bind=balanced with multiple MPI processes
- Issue #905⁵⁸⁹⁹ - --hpx:bind documentation should describe full grammar
- Issue #904⁵⁹⁰⁰ - Add hpx::lcos::fold and hpx::lcos::inverse_fold collective operation
- Issue #903⁵⁹⁰¹ - Add hpx::when_any_swapped()
- Issue #902⁵⁹⁰² - Add hpx::lcos::reduce collective operation

- Issue #901⁵⁹⁰³ - Web documentation is not searchable
- Issue #900⁵⁹⁰⁴ - Web documentation for trunk has no index
- Issue #898⁵⁹⁰⁵ - Some tests fail with GCC 4.8.1 and MPI parcel port
- Issue #897⁵⁹⁰⁶ - HWLOC causes failures on Mac
- Issue #896⁵⁹⁰⁷ - pu-offset leads to startup error
- Issue #895⁵⁹⁰⁸ - `hpx::get_locality_name` not defined
- Issue #894⁵⁹⁰⁹ - Race condition at shutdown
- Issue #893⁵⁹¹⁰ - --`hpx:print-bind` switches std::cout to hexadecimal mode
- Issue #892⁵⁹¹¹ - `hwloc_topology_load` can be expensive – don't call multiple times
- Issue #891⁵⁹¹² - The documentation for `get_locality_name` is wrong
- Issue #890⁵⁹¹³ - --`hpx:print-bind` should not exit
- Issue #889⁵⁹¹⁴ - --`hpx:debug-hpx-log=FILE` does not work
- Issue #888⁵⁹¹⁵ - MPI parcelport does not exit cleanly for --`hpx:print-bind`
- Issue #887⁵⁹¹⁶ - Choose thread affinities more cleverly
- Issue #886⁵⁹¹⁷ - Logging documentation is confusing
- Issue #885⁵⁹¹⁸ - Two threads are slower than one
- Issue #884⁵⁹¹⁹ - `is_callable` failing with member pointers in C++11
- Issue #883⁵⁹²⁰ - Need help with `is_callable_test`
- Issue #882⁵⁹²¹ - `tests/regressions/lcos.future_hang_on_get` does not terminate
- Issue #881⁵⁹²² - `tests/regressions/block_matrix/matrix.hh` won't compile with GCC 4.8.1
- Issue #880⁵⁹²³ - HPX does not work on OS X
- Issue #878⁵⁹²⁴ - `future::unwrap` triggers assertion
- Issue #877⁵⁹²⁵ - “make tests” has build errors on Ubuntu 12.10

- Issue #508⁵⁹⁹⁵ - FindPackage fails to set FOO_LIBRARY_DIR
- Issue #506⁵⁹⁹⁶ - Add cmake support to generate ini files for external applications
- Issue #470⁵⁹⁹⁷ - Changing build-type after configure does not update boost library names
- Issue #453⁵⁹⁹⁸ - Document hpx_run_tests.py
- Issue #445⁵⁹⁹⁹ - Significant performance mismatch between MPI and HPX in SMP for allgather example
- Issue #443⁶⁰⁰⁰ - Make docs viewable from build directory
- Issue #421⁶⁰⁰¹ - Support multiple HPX instances per node in a batch environment like PBS or SLURM
- Issue #316⁶⁰⁰² - Add message size limitation
- Issue #249⁶⁰⁰³ - Clean up locking code in big boot barrier
- Issue #136⁶⁰⁰⁴ - Persistent CMake variables need to be marked as cache variables

HPX V0.9.6 (Jul 30, 2013)

We have had over 1200 commits since the last release and we have closed roughly 140 tickets (bugs, feature requests, etc.).

General changes

The major new features in this release are:

- We further consolidated the API exposed by *HPX*. We aligned our APIs as much as possible with the existing C++11 Standard⁶⁰⁰⁵ and related proposals to the C++ standardization committee (such as N3632⁶⁰⁰⁶ and N3857⁶⁰⁰⁷).
- We implemented a first version of a distributed AGAS service which essentially eliminates all explicit AGAS network traffic.
- We created a native ibverbs parcelport allowing to take advantage of the superior latency and bandwidth characteristics of Infiniband networks.
- We successfully ported *HPX* to the Xeon Phi platform.
- Support for the SLURM scheduling system was implemented.
- Major efforts have been dedicated to improving the performance counter framework, numerous new counters were implemented and new APIs were added.
- We added a modular parcel compression system allowing to improve bandwidth utilization (by reducing the overall size of the transferred data).

⁵⁹⁹⁵ <https://github.com/STELLAR-GROUP/hpx/issues/508>

⁵⁹⁹⁶ <https://github.com/STELLAR-GROUP/hpx/issues/506>

⁵⁹⁹⁷ <https://github.com/STELLAR-GROUP/hpx/issues/470>

⁵⁹⁹⁸ <https://github.com/STELLAR-GROUP/hpx/issues/453>

⁵⁹⁹⁹ <https://github.com/STELLAR-GROUP/hpx/issues/445>

⁶⁰⁰⁰ <https://github.com/STELLAR-GROUP/hpx/issues/443>

6001 <https://github.com/STELLAR-GROUP/hpx/issues/421>6002 <https://github.com/STELLAR-GROUP/hpx/issues/316>6003 <https://github.com/STELLAR-GROUP/hpx/issues/249>6004 <https://github.com/STELLAR-GROUP/hpx/issues/136>6005 <http://www.open-std.org/jtc1/sc22/wg21>6006 <http://wg21.link/n3632>6007 <http://wg21.link/n3857>

- We added a modular parcel coalescing system allowing to combine several parcels into larger messages. This reduces latencies introduced by the communication layer.
- Added an experimental executors API allowing to use different scheduling policies for different parts of the code. This API has been modelled after the Standards proposal N3562⁶⁰⁰⁸. This API is bound to change in the future, though.
- Added minimal security support for localities which is enforced on the parcelport level. This support is preliminary and experimental and might change in the future.
- We created a parcelport using low level MPI functions. This is in support of legacy applications which are to be gradually ported and to support platforms where MPI is the only available portable networking layer.
- We added a preliminary and experimental implementation of a tuple-space object which exposes an interface similar to such systems described in the literature (see for instance The Linda Coordination Language⁶⁰⁰⁹).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is again a very long list of newly implemented features and fixed issues.

- Issue #806⁶⁰¹⁰ - make (all) in examples folder does nothing
- Issue #805⁶⁰¹¹ - Adding the introduction and fixing DOCBOOK dependencies for Windows use
- Issue #804⁶⁰¹² - Add stackless (non-suspendable) thread type
- Issue #803⁶⁰¹³ - Create proper serialization support functions for util::tuple
- Issue #800⁶⁰¹⁴ - Add possibility to disable array optimizations during serialization
- Issue #798⁶⁰¹⁵ - HPX_LIMIT does not work for local dataflow
- Issue #797⁶⁰¹⁶ - Create a parcelport which uses MPI
- Issue #796⁶⁰¹⁷ - Problem with Large Numbers of Threads
- Issue #793⁶⁰¹⁸ - Changing dataflow test case to hang consistently
- Issue #792⁶⁰¹⁹ - CMake Error
- Issue #791⁶⁰²⁰ - Problems with local::dataflow
- Issue #790⁶⁰²¹ - wait_for() doesn't compile
- Issue #789⁶⁰²² - HPX with Intel compiler segfaults
- Issue #788⁶⁰²³ - Intel compiler support

⁶⁰⁰⁸ <http://wg21.link/n3562>

- Issue #787⁶⁰²⁴ - Fixed SFINAEd specializations
- Issue #786⁶⁰²⁵ - Memory issues during benchmarking.
- Issue #785⁶⁰²⁶ - Create an API allowing to register external threads with HPX
- Issue #784⁶⁰²⁷ - util::plugin is throwing an error when a symbol is not found
- Issue #783⁶⁰²⁸ - How does hpx:bind work?
- Issue #782⁶⁰²⁹ - Added quotes around STRING REPLACE potentially empty arguments
- Issue #781⁶⁰³⁰ - Make sure no exceptions propagate into the thread manager
- Issue #780⁶⁰³¹ - Allow arithmetics performance counters to expand its parameters
- Issue #779⁶⁰³² - Test case for 778
- Issue #778⁶⁰³³ - Swapping futures segfaults
- Issue #777⁶⁰³⁴ - hpx::lcos::details::when_xxx don't restore completion handlers
- Issue #776⁶⁰³⁵ - Compiler chokes on dataflow overload with launch policy
- Issue #775⁶⁰³⁶ - Runtime error with local dataflow (copying futures?)
- Issue #774⁶⁰³⁷ - Using local dataflow without explicit namespace
- Issue #773⁶⁰³⁸ - Local dataflow with unwrap: functor operators need to be const
- Issue #772⁶⁰³⁹ - Allow (remote) actions to return a future
- Issue #771⁶⁰⁴⁰ - Setting HPX_LIMIT gives huge boost MPL errors
- Issue #770⁶⁰⁴¹ - Add launch policy to (local) dataflow
- Issue #769⁶⁰⁴² - Make compile time configuration information available
- Issue #768⁶⁰⁴³ - Const correctness problem in local dataflow
- Issue #767⁶⁰⁴⁴ - Add launch policies to async
- Issue #766⁶⁰⁴⁵ - Mark data structures for optimized (array based) serialization
- Issue #765⁶⁰⁴⁶ - Align hpx::any with N3508: Any Library Proposal (Revision 2)

- Issue #764⁶⁰⁴⁷ - Align hpx::future with newest N3558: A Standardized Representation of Asynchronous Operations
- Issue #762⁶⁰⁴⁸ - added a human readable output for the ping pong example
- Issue #761⁶⁰⁴⁹ - Ambiguous typename when constructing derived component
- Issue #760⁶⁰⁵⁰ - Simple components can not be derived
- Issue #759⁶⁰⁵¹ - make install doesn't give a complete install
- Issue #758⁶⁰⁵² - Stack overflow when using locking_hook<>
- Issue #757⁶⁰⁵³ - copy paste error; unsupported function overloading
- Issue #756⁶⁰⁵⁴ - GTCX runtime issue in Gordon
- Issue #755⁶⁰⁵⁵ - Papi counters don't work with reset and evaluate API's
- Issue #753⁶⁰⁵⁶ - cmake bugfix and improved component action docs
- Issue #752⁶⁰⁵⁷ - hpx simple component docs
- Issue #750⁶⁰⁵⁸ - Add hpx::util::any
- Issue #749⁶⁰⁵⁹ - Thread phase counter is not reset
- Issue #748⁶⁰⁶⁰ - Memory performance counter are not registered
- Issue #747⁶⁰⁶¹ - Create performance counters exposing arithmetic operations
- Issue #745⁶⁰⁶² - apply_callback needs to invoke callback when applied locally
- Issue #744⁶⁰⁶³ - CMake fixes
- Issue #743⁶⁰⁶⁴ - Problem Building github version of HPX
- Issue #742⁶⁰⁶⁵ - Remove HPX_STD_BIND
- Issue #741⁶⁰⁶⁶ - assertion 'px != 0' failed: HPX(assertion_failure) for low numbers of OS threads
- Issue #739⁶⁰⁶⁷ - Performance counters do not count to the end of the program or evaluation
- Issue #738⁶⁰⁶⁸ - Dedicated AGAS server runs don't work; console ignores -a option.
- Issue #737⁶⁰⁶⁹ - Missing bind overloads

- Issue #526⁶¹⁴² - Make HPX aware of hyper-threading
- Issue #518⁶¹⁴³ - Create facilities allowing to use plain arrays as action arguments
- Issue #473⁶¹⁴⁴ - hwloc thread binding is broken on CPUs with hyperthreading
- Issue #383⁶¹⁴⁵ - Change result type detection for hpx::util::bind to use result_of protocol
- Issue #341⁶¹⁴⁶ - Consolidate route code
- Issue #219⁶¹⁴⁷ - Only copy arguments into actions once
- Issue #177⁶¹⁴⁸ - Implement distributed AGAS
- Issue #43⁶¹⁴⁹ - Support for Darwin (Xcode + Clang)

HPX V0.9.5 (Jan 16, 2013)

We have had over 1000 commits since the last release and we have closed roughly 150 tickets (bugs, feature requests, etc.).

General changes

This release is continuing along the lines of code and API consolidation, and overall usability improvements. We dedicated much attention to performance and we were able to significantly improve the threading and networking subsystems.

We successfully ported *HPX* to the Android platform. *HPX* applications now not only can run on mobile devices, but we support heterogeneous applications running across architecture boundaries. At the Supercomputing Conference 2012 we demonstrated connecting Android tablets to simulations running on a Linux cluster. The Android tablet was used to query performance counters from the Linux simulation and to steer its parameters.

We successfully ported *HPX* to Mac OSX (using the Clang compiler). Thanks to Pyry Jahkola for contributing the corresponding patches. Please see the section `macos_installation` for more details.

We made a special effort to make *HPX* usable in highly concurrent use cases. Many of the *HPX* API functions which possibly take longer than 100 microseconds to execute now can be invoked asynchronously. We added uniform support for composing futures which simplifies to write asynchronous code. *HPX* actions (function objects encapsulating possibly concurrent remote function invocations) are now well integrated with all other API facilities such like `hpx::bind`.

2.10. Releases

1791

All of the API has been aligned as much as possible with established paradigms. HPX now mirrors many of the facilities as defined in the C++11 Standard, such as `hpx::thread`, `hpx::function`, `hpx::future`, etc.

A lot of work has been put into improving the documentation. Many of the API functions are documented now, concepts are explained in detail, and examples are better described than before. The new documentation index enables finding information with lesser effort.

This is the first release of HPX we perform after the move to [Github](#)⁶¹⁵⁰. This step has enabled a wider participation from the community and further encourages us in our decision to release HPX as a true open source library (HPX is licensed under the very liberal [Boost Software License](#)⁶¹⁵¹).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is by far the longest list of newly implemented features and fixed issues for any of HPX' releases so far.

- Issue #666⁶¹⁵² - Segfault on calling `hpx::finalize` twice
- Issue #665⁶¹⁵³ - Adding declaration `num_of_cores`
- Issue #662⁶¹⁵⁴ - `pkgconfig` is building wrong
- Issue #660⁶¹⁵⁵ - Need `uninterrupt` function
- Issue #659⁶¹⁵⁶ - Move our logging library into a different namespace
- Issue #658⁶¹⁵⁷ - Dynamic performance counter types are broken
- Issue #657⁶¹⁵⁸ - HPX v0.9.5 (RC1) `hello_world` example segfaulting
- Issue #656⁶¹⁵⁹ - Define the affinity of parcel-pool, io-pool, and timer-pool threads
- Issue #654⁶¹⁶⁰ - Integrate the Boost `auto_index` tool with documentation
- Issue #653⁶¹⁶¹ - Make HPX build on OS X + Clang + `libc++`
- Issue #651⁶¹⁶² - Add fine-grained control for thread pinning
- Issue #650⁶¹⁶³ - Command line no error message when using `-hpx:(anything)`
- Issue #645⁶¹⁶⁴ - Command line aliases don't work in `[teletype]``@file``[c++]`
- Issue #644⁶¹⁶⁵ - Terminated threads are not always properly cleaned up
- Issue #640⁶¹⁶⁶ - `future_data<T>::set_on_completed_` used without locks
- Issue #638⁶¹⁶⁷ - `hpx` build with intel compilers fails on linux

- Issue #637⁶¹⁶⁸ - --copy-dt-needed-entries breaks with gold
- Issue #635⁶¹⁶⁹ - Boost V1.53 will add Boost.Lockfree and Boost.Atomic
- Issue #633⁶¹⁷⁰ - Re-add examples to final 0.9.5 release
- Issue #632⁶¹⁷¹ - Example `thread_aware_timer` is broken
- Issue #631⁶¹⁷² - FFT application throws error in parcellayer
- Issue #630⁶¹⁷³ - Event synchronization example is broken
- Issue #629⁶¹⁷⁴ - Waiting on futures hangs
- Issue #628⁶¹⁷⁵ - Add an `HPX_ALWAYS_ASSERT` macro
- Issue #625⁶¹⁷⁶ - Port coroutines context switch benchmark
- Issue #621⁶¹⁷⁷ - New INI section for stack sizes
- Issue #618⁶¹⁷⁸ - `pkg_config` support does not work with a HPX debug build
- Issue #617⁶¹⁷⁹ - `hpx/external/logging/boost/logging/detail/cache_before_init.hpp:139:67:` error: ‘get_thread_id’ was not declared in this scope
- Issue #616⁶¹⁸⁰ - Change `wait_xxx` not to use locking
- Issue #615⁶¹⁸¹ - Revert visibility ‘fix’ (fb0b6b8245dad1127b0c25ebafd9386b3945cca9)
- Issue #614⁶¹⁸² - Fix Dataflow linker error
- Issue #613⁶¹⁸³ - `find_here` should throw an exception on failure
- Issue #612⁶¹⁸⁴ - Thread phase doesn’t show up in debug mode
- Issue #611⁶¹⁸⁵ - Make stack guard pages configurable at runtime (initialization time)
- Issue #610⁶¹⁸⁶ - Co-Locate Components
- Issue #609⁶¹⁸⁷ - `future_overhead`
- Issue #608⁶¹⁸⁸ - --`hpx:list-counter-infos` problem
- Issue #607⁶¹⁸⁹ - Update Boost.Context based backend for coroutines
- Issue #606⁶¹⁹⁰ - `1d_wave_equation` is not working

⁶¹⁹⁰ <https://github.com/STELLAR-GROUP/hpx/issues/606>

- Issue #605⁶¹⁹¹ - Any C++ function that has serializable arguments and a serializable return type should be re-mutable
- Issue #604⁶¹⁹² - Connecting localities isn't working anymore
- Issue #603⁶¹⁹³ - Do not verify any ini entries read from a file
- Issue #602⁶¹⁹⁴ - Rename argument_size to type_size/ added implementation to get parcel size
- Issue #599⁶¹⁹⁵ - Enable locality specific command line options
- Issue #598⁶¹⁹⁶ - Need an API that accesses the performance counter reporting the system uptime
- Issue #597⁶¹⁹⁷ - compiling on ranger
- Issue #595⁶¹⁹⁸ - I need a place to store data in a thread self pointer
- Issue #594⁶¹⁹⁹ - 32/64 interoperability
- Issue #593⁶²⁰⁰ - Warn if logging is disabled at compile time but requested at runtime
- Issue #592⁶²⁰¹ - Add optional argument value to --hpx:list-counters and --hpx:list-counter-infos
- Issue #591⁶²⁰² - Allow for wildcards in performance counter names specified with --hpx:print-counter
- Issue #590⁶²⁰³ - Local promise semantic differences
- Issue #589⁶²⁰⁴ - Create API to query performance counter names
- Issue #587⁶²⁰⁵ - Add get_num_localities and get_num_threads to AGAS API
- Issue #586⁶²⁰⁶ - Adjust local AGAS cache size based on number of localities
- Issue #585⁶²⁰⁷ - Error while using counters in HPX
- Issue #584⁶²⁰⁸ - counting argument size of actions, initial pass.
- Issue #581⁶²⁰⁹ - Remove RemoteResult template parameter for future<>
- Issue #580⁶²¹⁰ - Add possibility to hook into actions
- Issue #578⁶²¹¹ - Use angle brackets in HPX error dumps
- Issue #576⁶²¹² - Exception incorrectly thrown when --help is used
- Issue #575⁶²¹³ - HPX(bad_component_type) with gcc 4.7.2 and boost 1.51

⁶²¹³ <https://github.com/STELLAR-GROUP/hpx/issues/575>

- Issue #574⁶²¹⁴ - --hpx:connect command line parameter not working correctly
- Issue #571⁶²¹⁵ - hpx::wait() (callback version) should pass the future to the callback function
- Issue #570⁶²¹⁶ - hpx::wait should operate on boost::arrays and std::lists
- Issue #569⁶²¹⁷ - Add a logging sink for Android
- Issue #568⁶²¹⁸ - 2-argument version of HPX_DEFINE_COMPONENT_ACTION
- Issue #567⁶²¹⁹ - Connecting to a running HPX application works only once
- Issue #565⁶²²⁰ - HPX doesn't shutdown properly
- Issue #564⁶²²¹ - Partial preprocessing of new component creation interface
- Issue #563⁶²²² - Add hpx::start/hpx::stop to avoid blocking main thread
- Issue #562⁶²²³ - All command line arguments swallowed by hpx
- Issue #561⁶²²⁴ - Boost.Tuple is not move aware
- Issue #558⁶²²⁵ - boost::shared_ptr<> style semantics/syntax for client classes
- Issue #556⁶²²⁶ - Creation of partially preprocessed headers should be enabled for Boost newer than V1.50
- Issue #555⁶²²⁷ - BOOST_FORCEINLINE does not name a type
- Issue #554⁶²²⁸ - Possible race condition in thread get_id()
- Issue #552⁶²²⁹ - Move enable client_base
- Issue #550⁶²³⁰ - Add stack size category 'huge'
- Issue #549⁶²³¹ - ShenEOS run seg-faults on single or distributed runs
- Issue #545⁶²³² - AUTOGLOB broken for add_hpx_component
- Issue #542⁶²³³ - FindHPX_HDF5 still searches multiple times
- Issue #541⁶²³⁴ - Quotes around application name in hpx::init
- Issue #539⁶²³⁵ - Race condition occurring with new lightweight threads
- Issue #535⁶²³⁶ - hpx_run_tests.py exits with no error code when tests are missing

- Issue #530⁶²³⁷ - Thread description(<unknown>) in logs
- Issue #523⁶²³⁸ - Make thread objects more lightweight
- Issue #521⁶²³⁹ - `hpx::error_code` is not usable for lightweight error handling
- Issue #520⁶²⁴⁰ - Add full user environment to HPX logs
- Issue #519⁶²⁴¹ - Build succeeds, running fails
- Issue #517⁶²⁴² - Add a guard page to linux coroutine stacks
- Issue #516⁶²⁴³ - `hpx::thread::detach` suspends while holding locks, leads to hang in debug
- Issue #514⁶²⁴⁴ - Preprocessed headers for <hpx/apply.hpp> don't compile
- Issue #513⁶²⁴⁵ - Buildbot configuration problem
- Issue #512⁶²⁴⁶ - Implement action based stack size customization
- Issue #511⁶²⁴⁷ - Move action priority into a separate type trait
- Issue #510⁶²⁴⁸ - trunk broken
- Issue #507⁶²⁴⁹ - no matching function for call to `boost::scoped_ptr<hpx::threads::topology>::scoped_ptr(hpx::thre`
- Issue #505⁶²⁵⁰ - undefined_symbol regression test currently failing
- Issue #502⁶²⁵¹ - Adding OpenCL and OCLM support to HPX for Windows and Linux
- Issue #501⁶²⁵² - `find_package(HPX)` sets `cmake` output variables
- Issue #500⁶²⁵³ - `wait_any/wait_all` are badly named
- Issue #499⁶²⁵⁴ - Add support for disabling pbs support in pbs runs
- Issue #498⁶²⁵⁵ - Error during no-cache runs
- Issue #496⁶²⁵⁶ - Add partial preprocessing support to `cmake`
- Issue #495⁶²⁵⁷ - Support HPX modules exporting startup/shutdown functions only
- Issue #494⁶²⁵⁸ - Allow modules to specify when to run startup/shutdown functions
- Issue #493⁶²⁵⁹ - Avoid constructing a string in `make_success_code`

HPX V0.9.0 (Jul 5, 2012)

We have had roughly 800 commits since the last release and we have closed approximately 80 tickets (bugs, feature requests, etc.).

General changes

- Significant improvements made to the usability of *HPX* in large-scale, distributed environments.
- Renamed `hpx::lcos::packaged_task` to `hpx::lcos::packaged_action` to reflect the semantic differences to a `packaged_task` as defined by the C++11 Standard⁶³⁰⁸.
- *HPX* now exposes `hpx::thread` which is compliant to the C++11 std::thread type except that it (purely locally) represents an *HPX* thread. This new type does not expose any of the remote capabilities of the underlying *HPX*-thread implementation.
- The type `hpx::lcos::future` is now compliant to the C++11 std::future<> type. This type can be used to synchronize both, local and remote operations. In both cases the control flow will ‘return’ to the future in order to trigger any continuation.
- The types `hpx::lcos::local::promise` and `hpx::lcos::local::packaged_task` are now compliant to the C++11 std::promise<> and std::packaged_task<> types. These can be used to create a future representing local work only. Use the types `hpx::lcos::promise` and `hpx::lcos::packaged_action` to wrap any (possibly remote) action into a future.
- `hpx::thread` and `hpx::lcos::future` are now cancelable.
- Added support for sequential and logic composition of `hpx::lcos::futures`. The member function `hpx::lcos::future::when` permits futures to be sequentially composed. The helper functions `hpx::wait_all`, `hpx::wait_any`, and `hpx::wait_n` can be used to wait for more than one future at a time.
- *HPX* now exposes `hpx::apply` and `hpx::async` as the preferred way of creating (or invoking) any deferred work. These functions are usable with various types of functions, function objects, and actions and provide a uniform way to spawn deferred tasks.
- *HPX* now utilizes `hpx::util::bind` to (partially) bind local functions and function objects, and also actions. Remote bound actions can have placeholders as well.
- *HPX* continuations are now fully polymorphic. The class `hpx::actions::forwarding_continuation` is an example of how the user can write their own types of continuations. It can be used to execute any function as an continuation of a particular action.
- Reworked the action invocation API to be fully conformant to normal functions. Actions can now be invoked using `hpx::apply`, `hpx::async`, or using the `operator()` implemented on actions. Actions themselves can now be cheaply instantiated as they do not have any members anymore.
- Reworked the lazy action invocation API. Actions can now be directly bound using `hpx::util::bind` by passing an action instance as the first argument.
- A minimal *HPX* program now looks like this:

⁶³⁰⁶ <https://github.com/STELLAR-GROUP/hpx/issues/48>

⁶³⁰⁷ <https://github.com/STELLAR-GROUP/hpx/issues/21>

⁶³⁰⁸ <http://www.open-std.org/jtc1/sc22/wg21>

```
#include <hpx/hpx_init.hpp>

int hpx_main()
{
    return hpx::finalize();
}

int main()
{
    return hpx::init();
}
```

This removes the immediate dependency on the `Boost.Program_Options`⁶³⁰⁹ library.

Note: This minimal version of an *HPX* program does not support any of the default command line arguments (such as `-help`, or command line options related to PBS). It is suggested to always pass `argc` and `argv` to *HPX* as shown in the example below.

- In order to support those, but still not to depend on `Boost.Program_Options`⁶³¹⁰, the minimal program can be written as:

```
#include <hpx/hpx_init.hpp>

// The arguments for hpx_main can be left off, which very similar to the
// behavior of ``main()`` as defined by C++.
int hpx_main(int argc, char* argv[])
{
    return hpx::finalize();
}

int main(int argc, char* argv[])
{
    return hpx::init(argc, argv);
}
```

- Added performance counters exposing the number of component instances which are alive on a given locality.
- Added performance counters exposing then number of messages sent and received, the number of parcels sent and received, the number of bytes sent and received, the overall time required to send and receive data, and the overall time required to serialize and deserialize the data.
- Added a new component: `hpx::components::binpacking_factory` which is equivalent to the existing `hpx::components::distributing_factory` component, except that it equalizes the overall population of the components to create. It exposes two factory methods, one based on the number of existing instances of the component type to create, and one based on an arbitrary performance counter which will be queried for all relevant localities.
- Added API functions allowing to access elements of the diagnostic information embedded in the given exception: `hpx::get_locality_id`, `hpx::get_host_name`, `hpx::get_process_id`, `hpx::get_function_name`, `hpx::get_file_name`, `hpx::get_line_number`, `hpx::get_os_thread`, `hpx::get_thread_id`, and `hpx::get_thread_description`.

⁶³¹⁰ https://www.boost.org/doc/html/program_options.html

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #71⁶³¹¹ - GIDs that are not serialized via `handle_gid<>` should raise an exception
- Issue #105⁶³¹² - Allow for `hpx::util::functions` to be registered in the AGAS symbolic namespace
- Issue #107⁶³¹³ - Nasty threadmanger race condition (reproducible in `sheneos_test`)
- Issue #108⁶³¹⁴ - Add millisecond resolution to *HPX* logs on Linux
- Issue #110⁶³¹⁵ - Shutdown hang in distributed with release build
- Issue #116⁶³¹⁶ - Don't use TSS for the applier and runtime pointers
- Issue #162⁶³¹⁷ - Move local synchronous execution shortcut from `hpx::function` to the applier
- Issue #172⁶³¹⁸ - Cache sources in CMake and check if they change manually
- Issue #178⁶³¹⁹ - Add an INI option to turn off ranged-based AGAS caching
- Issue #187⁶³²⁰ - Support for disabling performance counter deployment
- Issue #202⁶³²¹ - Support for sending performance counter data to a specific file
- Issue #218⁶³²² - boost.coroutines allows different stack sizes, but stack pool is unaware of this
- Issue #231⁶³²³ - Implement movable `boost::bind`
- Issue #232⁶³²⁴ - Implement movable `boost::function`
- Issue #236⁶³²⁵ - Allow binding `hpx::util::function` to actions
- Issue #239⁶³²⁶ - Replace `hpx::function` with `hpx::util::function`
- Issue #240⁶³²⁷ - Can't specify RemoteResult with `Icos::async`
- Issue #242⁶³²⁸ - REGISTER_TEMPLATE support for plain actions
- Issue #243⁶³²⁹ - `handle_gid<>` support for `hpx::util::function`
- Issue #245⁶³³⁰ - `*_c_cache` code throws an exception if the queried GID is not in the local cache
- Issue #246⁶³³¹ - Undefined references in dataflow/adaptive1d example

- Issue #275⁶³⁴² - Problem with configuration tests/include paths on Gentoo
- Issue #325⁶³⁴³ - Sheneos is 200-400 times slower than the fortran equivalent
- Issue #331⁶³⁴⁴ - `hpx::init` and `hpx_main()` should not depend on `program_options`
- Issue #333⁶³⁴⁵ - Add doxygen support to CMake for doc toolchain
- Issue #340⁶³⁴⁶ - Performance counters for parcels
- Issue #346⁶³⁴⁷ - Component loading error when running hello_world in distributed on MSVC2010
- Issue #362⁶³⁴⁸ - Missing initializer error
- Issue #363⁶³⁴⁹ - Parcel port serialization error
- Issue #366⁶³⁵⁰ - Parcel buffering leads to types incompatible exception
- Issue #368⁶³⁵¹ - Scalable alternative to rand() needed for *HPX*
- Issue #369⁶³⁵² - IB over IP is substantially slower than just using standard TCP/IP
- Issue #374⁶³⁵³ - `hpx::lcos::wait` should work with dataflows and arbitrary classes meeting the future interface
- Issue #375⁶³⁵⁴ - Conflicting/ambiguous overloads of `hpx::lcos::wait`

- Issue #376⁶³⁵⁵ - Find_HPX.cmake should set CMake variable HPX_FOUND for out of tree builds
- Issue #377⁶³⁵⁶ - ShenEOS interpolate bulk and interpolate_one_bulk are broken
- Issue #379⁶³⁵⁷ - Add support for distributed runs under SLURM
- Issue #382⁶³⁵⁸ - _Unwind_Word not declared in boost.backtrace
- Issue #387⁶³⁵⁹ - Doxygen should look only at list of specified files
- Issue #388⁶³⁶⁰ - Running make install on an out-of-tree application is broken
- Issue #391⁶³⁶¹ - Out-of-tree application segfaults when running in qsub
- Issue #392⁶³⁶² - Remove HPX_NO_INSTALL option from cmake build system
- Issue #396⁶³⁶³ - Pragma related warnings when compiling with older gcc versions
- Issue #399⁶³⁶⁴ - Out of tree component build problems
- Issue #400⁶³⁶⁵ - Out of source builds on Windows: linker should not receive compiler flags
- Issue #401⁶³⁶⁶ - Out of source builds on Windows: components need to be linked with hpx_serialization
- Issue #404⁶³⁶⁷ - gfortran fails to link automatically when fortran files are present
- Issue #405⁶³⁶⁸ - Inability to specify linking order for external libraries
- Issue #406⁶³⁶⁹ - Adapt action limits such that dataflow applications work without additional defines
- Issue #415⁶³⁷⁰ - locality_results is not a member of hpx::components::server
- Issue #425⁶³⁷¹ - Breaking changes to traits::*result wrt std::vector<id_type>
- Issue #426⁶³⁷² - AUTOGLOB needs to be updated to support fortran

HPX V0.8.1 (Apr 21, 2012)

This is a point release including important bug fixes for *HPX V0.8.0 (Mar 23, 2012)*.

⁶³⁵⁵ <https://github.com/STELLAR-GROUP/hpx/issues/376>
⁶³⁵⁶ <https://github.com/STELLAR-GROUP/hpx/issues/377>

⁶³⁶⁶ <https://github.com/STELLAR-GROUP/hpx/issues/401>
⁶³⁶⁷ <https://github.com/STELLAR-GROUP/hpx/issues/404>
⁶³⁶⁸ <https://github.com/STELLAR-GROUP/hpx/issues/405>
⁶³⁶⁹ <https://github.com/STELLAR-GROUP/hpx/issues/406>
⁶³⁷⁰ <https://github.com/STELLAR-GROUP/hpx/issues/415>
⁶³⁷¹ <https://github.com/STELLAR-GROUP/hpx/issues/425>
⁶³⁷² <https://github.com/STELLAR-GROUP/hpx/issues/426>

General changes

- HPX does not need to be installed anymore to be functional.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this point release:

- Issue #295⁶³⁷³ - Don't require install path to be known at compile time.
- Issue #371⁶³⁷⁴ - Add hpx iostreams to standard build.
- Issue #384⁶³⁷⁵ - Fix compilation with GCC 4.7.
- Issue #390⁶³⁷⁶ - Remove keep_factory_alive startup call from ShenEOS; add shutdown call to H5close.
- Issue #393⁶³⁷⁷ - Thread affinity control is broken.

Bug fixes (commits)

Here is a list of the important commits included in this point release:

- r7642 - External: Fix backtrace memory violation.
- **r7775 - Components: Fix symbol visibility bug with component startup** providers. This prevents one components providers from overriding another components.
- r7778 - Components: Fix startup/shutdown provider shadowing issues.

HPX V0.8.0 (Mar 23, 2012)

We have had roughly 1000 commits since the last release and we have closed approximately 70 tickets (bugs, feature requests, etc.).

General changes

- Improved PBS support, allowing for arbitrary naming schemes of node-hostnames.
- Finished verification of the reference counting framework.
- Implemented decrement merging logic to optimize the distributed reference counting system.
- Restructured the LCO framework. Renamed `hpx::lcos::eager_future<>` and `hpx::lcos::lazy_future<>` into `hpx::lcos::packaged_task` and `hpx::lcos::deferred_packaged_task`. Split `hpx::lcos::promise` into `hpx::lcos::packaged_task` and `hpx::lcos::future`. Added 'local' futures (in namespace `hpx::lcos::local`).
- Improved the general performance of local and remote action invocations. This (under certain circumstances) drastically reduces the number of copies created for each of the parameters and return values.

⁶³⁷³ <https://github.com/STELLAR-GROUP/hpx/issues/295>

⁶³⁷⁴ <https://github.com/STELLAR-GROUP/hpx/issues/371>

⁶³⁷⁵ <https://github.com/STELLAR-GROUP/hpx/issues/384>

⁶³⁷⁶ <https://github.com/STELLAR-GROUP/hpx/issues/390>

⁶³⁷⁷ <https://github.com/STELLAR-GROUP/hpx/issues/393>

- Reworked the performance counter framework. Performance counters are now created only when needed, which reduces the overall resource requirements. The new framework allows for much more flexible creation and management of performance counters. The new sine example application demonstrates some of the capabilities of the new infrastructure.
- Added a buildbot-based continuous build system which gives instant, automated feedback on each commit to SVN.
- Added more automated tests to verify proper functioning of *HPX*.
- Started to create documentation for *HPX* and its API.
- Added documentation toolchain to the build system.
- Added dataflow LCO.
- Changed default *HPX* command line options to have `hpx:` prefix. For instance, the former option `--threads` is now `--hpx:threads`. This has been done to make ambiguities with possible application specific command line options as unlikely as possible. See the section *HPX Command Line Options* for a full list of available options.
- Added the possibility to define command line aliases. The former short (one-letter) command line options have been predefined as aliases for backwards compatibility. See the section *HPX Command Line Options* for a detailed description of command line option aliasing.
- Network connections are now cached based on the connected host. The number of simultaneous connections to a particular host is now limited. Parcels are buffered and bundled if all connections are in use.
- Added more refined thread affinity control. This is based on the external library Portable Hardware Locality (HWLOC).
- Improved support for Windows builds with CMake.
- Added support for components to register their own command line options.
- Added the possibility to register custom startup/shutdown functions for any component. These functions are guaranteed to be executed by an *HPX* thread.
- Added two new experimental thread schedulers: `hierarchy_scheduler` and `periodic_priority_scheduler`. These can be activated by using the command line options `--hpx:queuing=hierarchy` or `--hpx:queuing=periodic`.

Example applications

- Graph500 performance benchmark⁶³⁷⁸ (thanks to Matthew Anderson for contributing this application).
- GTC (Gyrokinetic Toroidal Code)⁶³⁷⁹: a skeleton for particle in cell type codes.
- Random Memory Access: an example demonstrating random memory accesses in a large array
- ShenEOS example⁶³⁸⁰, demonstrating partitioning of large read-only data structures and exposing an interpolation API.
- Sine performance counter demo.
- Accumulator examples demonstrating how to write and use *HPX* components.
- Quickstart examples (like `hello_world`, `fibonacci`, `quicksort`, `factorial`, etc.) demonstrating simple *HPX* concepts which introduce some of the concepts in *HPX*.
- Load balancing and work stealing demos.

⁶³⁷⁸ <http://www.graph500.org/>

⁶³⁷⁹ <http://www.nersc.gov/research-and-development/benchmarking-and-workload-characterization/nersc-6-benchmarks/gtc/>

⁶³⁸⁰ <http://stellarcollapse.org/equationofstate>

API changes

- Moved all local LCOs into a separate namespace `hpx::lcos::local` (for instance, `hpx::lcos::local_mutex` is now `hpx::lcos::local::mutex`).
- Replaced `hpx::actions::function` with `hpx::util::function`. Cleaned up related code.
- Removed `hpx::traits::handle_gid` and moved handling of global reference counts into the corresponding serialization code.
- Changed terminology: `prefix` is now called `locality_id`, renamed the corresponding API functions (such as `hpx::get_prefix`, which is now called `hpx::get_locality_id`).
- Adding `hpx::find_remote_localities`, and `hpx::get_num_localities`.
- Changed performance counter naming scheme to make it more bash friendly. The new performance counter naming scheme is now

```
/object{parentname#parentindex/instance#index}/counter#parameters
```

- Added `hpx::get_worker_thread_num` replacing `hpx::threadmanager_base::get_thread_num`.
- Renamed `hpx::get_num_os_threads` to `hpx::get_os_threads_count`.
- Added `hpx::threads::get_thread_count`.
- Restructured the Futures sub-system, renaming types in accordance with the terminology used by the C++11 ISO standard.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #31⁶³⁸¹ - Specialize handle_gid<> for examples and tests
- Issue #72⁶³⁸² - Fix AGAS reference counting
- Issue #104⁶³⁸³ - heartbeat throws an exception when decrefing the performance counter it's watching
- Issue #111⁶³⁸⁴ - throttle causes an exception on the target application
- Issue #142⁶³⁸⁵ - One failed component loading causes an unrelated component to fail
- Issue #165⁶³⁸⁶ - Remote exception propagation bug in AGAS reference counting test
- Issue #186⁶³⁸⁷ - Test credit exhaustion/splitting (e.g. prepare_gid and symbol NS)
- Issue #188⁶³⁸⁸ - Implement remaining AGAS reference counting test cases
- Issue #258⁶³⁸⁹ - No type checking of GIDs in stubs classes
- Issue #271⁶³⁹⁰ - Seg fault/shared pointer assertion in distributed code

⁶³⁹⁰ <https://github.com/STELLAR-GROUP/hpx/issues/271>

- Issue #281⁶³⁹¹ - CMake options need descriptive text
- Issue #283⁶³⁹² - AGAS caching broken (gva_cache needs to be rewritten with ICL)
- Issue #285⁶³⁹³ - HPX_INSTALL root directory not the same as CMAKE_INSTALL_PREFIX
- Issue #286⁶³⁹⁴ - New segfault in dataflow applications
- Issue #289⁶³⁹⁵ - Exceptions should only be logged if not handled
- Issue #290⁶³⁹⁶ - c++11 tests failure
- Issue #293⁶³⁹⁷ - Build target for component libraries
- Issue #296⁶³⁹⁸ - Compilation error with Boost V1.49rc1
- Issue #298⁶³⁹⁹ - Illegal instructions on termination
- Issue #299⁶⁴⁰⁰ - gravity aborts with multiple threads
- Issue #301⁶⁴⁰¹ - Build error with Boost trunk
- Issue #303⁶⁴⁰² - Logging assertion failure in distributed runs
- Issue #304⁶⁴⁰³ - Exception ‘what’ strings are lost when exceptions from decode_parcel are reported
- Issue #306⁶⁴⁰⁴ - Performance counter user interface issues
- Issue #307⁶⁴⁰⁵ - Logging exception in distributed runs
- Issue #308⁶⁴⁰⁶ - Logging deadlocks in distributed
- Issue #309⁶⁴⁰⁷ - Reference counting test failures and exceptions
- Issue #311⁶⁴⁰⁸ - Merge AGAS remote_interface with the runtime_support object
- Issue #314⁶⁴⁰⁹ - Object tracking for id_types
- Issue #315⁶⁴¹⁰ - Remove handle_gid and handle credit splitting in id_type serialization
- Issue #320⁶⁴¹¹ - applier::get_locality_id() should return an error value (or throw an exception)
- Issue #321⁶⁴¹² - Optimization for id_types which are never split should be restored
- Issue #322⁶⁴¹³ - Command line processing ignored with Boost 1.47.0

6427 <https://github.com/STELLAR-GROUP/hpx/issues/359>

6428 <https://github.com/STELLAR-GROUP/hpx/issues/361>

6429 <https://github.com/STELLAR-GROUP/hpx/issues/364>

General changes

- Completely removed code related to deprecated AGAS V1, started to work on AGAS V2.1.
- Started to clean up and streamline the exposed APIs (see ‘API changes’ below for more details).
- Revamped and unified performance counter framework, added a lot of new performance counter instances for monitoring of a diverse set of internal *HPX* parameters (queue lengths, access statistics, etc.).
- Improved general error handling and logging support.
- Fixed several race conditions, improved overall stability, decreased memory footprint, improved overall performance (major optimizations include native TLS support and ranged-based AGAS caching).
- Added support for running *HPX* applications with PBS.
- Many updates to the build system, added support for gcc 4.5.x and 4.6.x, added C++11 support.
- Many updates to default command line options.
- Added many tests, set up buildbot for continuous integration testing.
- Better shutdown handling of distributed applications.

Example applications

- quickstart/factorial and quickstart/fibonacci, future-recursive parallel algorithms.
- quickstart/hello_world, distributed hello world example.
- quickstart/rma, simple remote memory access example
- quickstart/quicksort, parallel quicksort implementation.
- gtc, gyrokinetic torodial code.
- bfs, breadth-first-search, example code for a graph application.
- sheneos, partitioning of large data sets.
- accumulator, simple component example.
- balancing/os_thread_num, balancing/px_thread_phase, examples demonstrating load balancing and work stealing.

API changes

- Added `hpx::find_all_localities`.
- Added `hpx::terminate` for non-graceful termination of applications.
- Added `hpx::lcos::async` functions for simpler asynchronous programming.
- Added new AGAS interface for handling of symbolic namespace (`hpx::agas::*`).
- Renamed `hpx::components::wait` to `hpx::lcos::wait`.
- Renamed `hpx::lcos::future_value` to `hpx::lcos::promise`.
- Renamed `hpx::lcos::recursive_mutex` to `hpx::lcos::local_recursive_mutex`, `hpx::lcos::mutex` to `hpx::lcos::local_mutex`
- Removed support for Boost versions older than V1.38, recommended Boost version is now V1.47 and newer.

- Removed `hpx::process` (this will be replaced by a real process implementation in the future).
- Removed non-functional LCO code (`hpx::lcos::dataflow`, `hpx::lcos::thunk`, `hpx::lcos::dataflow_variable`).
- Removed deprecated `hpx::naming::full_address`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #28⁶⁴³⁰ - Integrate Windows/Linux CMake code for *HPX* core
- Issue #32⁶⁴³¹ - `hpx::cout()` should be `hpx::cout`
- Issue #33⁶⁴³² - AGAS V2 legacy client does not properly handle `error_code`
- Issue #60⁶⁴³³ - AGAS: allow for registerid to optionally take ownership of the gid
- Issue #62⁶⁴³⁴ - adaptive1d compilation failure in Fusion
- Issue #64⁶⁴³⁵ - Parcel subsystem doesn't resolve domain names
- Issue #83⁶⁴³⁶ - No error handling if no console is available
- Issue #84⁶⁴³⁷ - No error handling if a hosted locality is treated as the bootstrap server
- Issue #90⁶⁴³⁸ - Add general commandline option `-N`
- Issue #91⁶⁴³⁹ - Add possibility to read command line arguments from file
- Issue #92⁶⁴⁴⁰ - Always log exceptions/errors to the log file
- Issue #93⁶⁴⁴¹ - Log the command line/program name
- Issue #95⁶⁴⁴² - Support for distributed launches
- Issue #97⁶⁴⁴³ - Attempt to create a bad component type in AMR examples
- Issue #100⁶⁴⁴⁴ - factorial and factorial_get examples trigger AGAS component type assertions
- Issue #101⁶⁴⁴⁵ - Segfault when `hpx::process::here()` is called in fibonacci2
- Issue #102⁶⁴⁴⁶ - unknown_component_address in int_object_semaphore_client
- Issue #114⁶⁴⁴⁷ - marduk raises assertion with default parameters

6446 <https://github.com/STELLAR-GROUP/hpx/issues/102>

6447 <https://github.com/STELLAR-GROUP/hpx/issues/114>

- Issue #115⁶⁴⁴⁸ - Logging messages for SMP runs (on the console) shouldn't be buffered
- Issue #119⁶⁴⁴⁹ - marduk linking strategy breaks other applications
- Issue #121⁶⁴⁵⁰ - pbsdsh problem
- Issue #123⁶⁴⁵¹ - marduk, dataflow and adaptive1d fail to build
- Issue #124⁶⁴⁵² - Lower default preprocessing arity
- Issue #125⁶⁴⁵³ - Move hpx::detail::diagnostic_information out of the detail namespace
- Issue #126⁶⁴⁵⁴ - Test definitions for AGAS reference counting
- Issue #128⁶⁴⁵⁵ - Add averaging performance counter
- Issue #129⁶⁴⁵⁶ - Error with endian.hpp while building adaptive1d
- Issue #130⁶⁴⁵⁷ - Bad initialization of performance counters
- Issue #131⁶⁴⁵⁸ - Add global startup/shutdown functions to component modules
- Issue #132⁶⁴⁵⁹ - Avoid using auto_ptr
- Issue #133⁶⁴⁶⁰ - On Windows hpx.dll doesn't get installed
- Issue #134⁶⁴⁶¹ - HPX_LIBRARY does not reflect real library name (on Windows)
- Issue #135⁶⁴⁶² - Add detection of unique_ptr to build system
- Issue #137⁶⁴⁶³ - Add command line option allowing to repeatedly evaluate performance counters
- Issue #139⁶⁴⁶⁴ - Logging is broken
- Issue #140⁶⁴⁶⁵ - CMake problem on windows
- Issue #141⁶⁴⁶⁶ - Move all non-component libraries into \$PREFIX/lib/hpx
- Issue #143⁶⁴⁶⁷ - adaptive1d throws an exception with the default command line options

2.10.2 Namespace changes

HPX V1.9.0 Namespace changes

The latest release includes amongst others changes in the namespaces so that *HPX* facilities correspond to the C++ Standard Library. The old namespaces are deprecated. Below is a comprehensive list of the namespace changes.

Table 2.187: Namespace changes in V1.9.0

Old namespace	New namespace
<code>hpx::util::mem_fn</code>	<code>hpx::mem_fn</code>
<code>hpx::util::invoke</code>	<code>hpx::invoke</code>
<code>hpx::util::invoke_r</code>	<code>hpx::invoke_r</code>
<code>hpx::util::invoke_fused</code>	<code>hpx::invoke_fused</code>
<code>hpx::util::invoke_fused_r</code>	<code>hpx::invoke_fused_r</code>
<code>hpx::util::unlock_guard</code>	<code>hpx::unlock_guard</code>
<code>hpx::parallel::v1::reduce_by_key</code>	<code>hpx::experimental::reduce_by_key</code>
<code>hpx::parallel::v1::sort_by_key</code>	<code>hpx::experimental::sort_by_key</code>
<code>hpx::parallel::task_canceled_exception</code>	<code>hpx::experimental::task_canceled_exception</code>
<code>hpx::parallel::task_block</code>	<code>hpx::experimental::task_block</code>
<code>hpx::parallel::define_task_block</code>	<code>hpx::experimental::define_task_block </code>
<code>hpx::parallel::define_task_block_restore_t</code>	<code>hpx::experimental::define_task_block_restore_thread</code>
<code>hpx::execution::experimental::task_group</code>	<code>hpx::experimental::task_group</code>

2.11 Citing HPX

Please cite *HPX* whenever you use it for publications. Use our paper in The Journal of Open Source Software as the main citation for *HPX*:⁶⁵⁰⁶. Use the Zenodo entry for referring to the latest version of *HPX*:⁶⁵⁰⁷. Entries for citing specific versions of *HPX* can also be found at⁶⁵⁰⁸.

2.12 HPX users

A list of institutions and projects using *HPX* can be found on the [HPX Users](#)⁶⁵⁰⁹ page.

2.13 About HPX

2.13.1 History

The development of High Performance ParalleX (*HPX*) began in 2007. At that time, Hartmut Kaiser became interested in the work done by the ParalleX group at the Center for Computation and Technology (CCT)⁶⁵¹⁰, a multi-disciplinary research institute at Louisiana State University (LSU)⁶⁵¹¹. The ParalleX group was working to develop a new and experimental execution model for future high performance computing architectures. This model was christened ParalleX. The first implementations of ParalleX were crude, and many of those designs had to be discarded entirely. However, over time the team learned quite a bit about how to design a parallel, distributed runtime system which implements the concepts of ParalleX.

From the very beginning, this endeavour has been a group effort. In addition to a handful of interested researchers, there have always been graduate and undergraduate students participating in the discussions, design, and implementation of *HPX*. In 2011 we decided to formalize our collective research efforts by creating the STE||AR⁶⁵¹² group (Systems Technology, Emergent Parallelism, and Algorithm Research). Over time, the team grew to include researchers around the country and the world. In 2014, the STE||AR⁶⁵¹³ Group was reorganized to become the international community it is today. This consortium of researchers aims to develop stable, sustainable, and scalable tools which will enable application developers to exploit the parallelism latent in the machines of today and tomorrow. Our goal of the *HPX* project is to create a high quality, freely available, open source implementation of ParalleX concepts for conventional and future systems by building a modular and standards conforming runtime system for SMP and distributed application environments. The API exposed by *HPX* is conformant to the interfaces defined by the C++ ISO Standard and adheres to the programming guidelines used by the Boost⁶⁵¹⁴ collection of C++ libraries. We steer the development of *HPX* with real world applications and aim to provide a smooth migration path for domain scientists.

To learn more about STE||AR⁶⁵¹⁵ and ParalleX, see [People](#) and [Why HPX?](#).

2.13.2 People

The STE||AR⁶⁵¹⁶ Group (pronounced as stellar) stands for “Systems Technology, Emergent Parallelism, and Algorithm Research”. We are an international group of faculty, researchers, and students working at various institutions around the world. The goal of the STE||AR⁶⁵¹⁷ Group is to promote the development of scalable parallel applications by providing a community for ideas, a framework for collaboration, and a platform for communicating these concepts to the broader community.

Our work is focused on building technologies for scalable parallel applications. *HPX*, our general purpose C++ runtime system for parallel and distributed applications, is no exception. We use *HPX* for a broad range of scientific applications, helping scientists and developers to write code which scales better and shows better performance compared to more conventional programming models such as MPI.

HPX is based on *ParalleX* which is a new (and still experimental) parallel execution model aiming to overcome the limitations imposed by the current hardware and the techniques we use to write applications today. Our group focuses on two types of applications - those requiring excellent strong scaling, allowing for a dramatic reduction of execution time for fixed workloads and those needing highest level of sustained performance through massive parallelism. These applications are presently unable (through conventional practices) to effectively exploit a relatively small number of cores in a multi-core system. By extension, these application will not be able to exploit high-end exascale computing systems which are likely to employ hundreds of millions of such cores by the end of this decade.

Critical bottlenecks to the effective use of new generation high performance computing (HPC) systems include:

- *Starvation*: due to lack of usable application parallelism and means of managing it,
- *Overhead*: reduction to permit strong scalability, improve efficiency, and enable dynamic resource management,
- *Latency*: from remote access across system or to local memories,
- *Contention*: due to multicore chip I/O pins, memory banks, and system interconnects.

The ParalleX model has been devised to address these challenges by enabling a new computing dynamic through the application of message-driven computation in a global address space context with lightweight synchronization. The work on *HPX* is centered around implementing the concepts as defined by the ParalleX model. *HPX* is currently targeted at conventional machines, such as classical Linux based Beowulf clusters and SMP nodes.

We fully understand that the success of *HPX* (and ParalleX) is very much the result of the work of many people. To see a list of who is contributing see our tables below.

- Srinivas Yadav, for his work on SIMD support in algorithms before and during Google Summer of Code 2021.
- Akhil Nair, for his work on adapting algorithms to C++20 before and during Google Summer of Code 2021.
- Alexander Toktarev, for updating the parallel algorithm customization points to use `tag_fallback_invoke` for the default implementations.
- Brice Goglin, for reporting and helping fix issues related to the integration of `hwloc` in *HPX*.
- Giannis Gonidelis, for his work on the ranges adaptation during the Google Summer of Code 2020.
- Auriane Reverdell (Swiss National Supercomputing Centre⁶⁵⁴⁷), for her tireless work on refactoring our CMake setup and modularizing *HPX*.
- Christopher Hinz, for his work on refactoring our CMake setup.
- Weile Wei, for fixing *HPX* builds with CUDA on Summit.
- Severin Strobl, for fixing our CMake setup related to linking and adding new entry points to the *HPX* runtime.
- Rebecca Stobaugh, for her major documentation review and contributions during and after the 2019 Google Season of Documentation.
- Jan Melech, for adding automatic serialization of simple structs.
- Austin McCartney, for adding concept emulation of the Ranges TS bidirectional and random access iterator concepts.
- Marco Diers, reporting and fixing issues related PMIx.
- Maximilian Bremer, for reporting multiple issues and extending the component migration tests.
- Piotr Mikolajczyk, for his improvements and fixes to the set and count algorithms.
- Grant Rostig, for reporting several deficiencies on our web pages.
- Jakub Golinowski, for implementing an *HPX* backend for OpenCV and in the process improving documentation and reporting issues.
- Mikael Simberg (Swiss National Supercomputing Centre⁶⁵⁴⁸), for his tireless help cleaning up and maintaining *HPX*.
- Tianyi Zhang, for his work on HPXMP.
- Shahrzad Shirzad, for her contributions related to Phylanx.
- Christopher Ogle, for his contributions to the parallel algorithms.
- Surya Priy, for his work with statistic performance counters.
- Anushi Maheshwari, for her work on random number generation.
- Bruno Pitrus, for his work with parallel algorithms.
- Nikunj Gupta, for rewriting the implementation of `hpx_main.hpp` and for his fixes for tests.
- Christopher Taylor, for his interest in *HPX* and the fixes he provided. Chris also contributed support for RISC-V architectures.
- Shoshana Jakobovits, for her work on the resource partitioner.
- Denis Blank, who re-wrote our unwrapped function to accept plain values arbitrary containers, and properly deal with nested futures.
- Ajai V. George, who implemented several of the parallel algorithms.

⁶⁵⁴⁷ <https://www.cscs.ch>

⁶⁵⁴⁸ <https://www.cscs.ch>

- Taeguk Kwon, who worked on implementing parallel algorithms as well as adapting the parallel algorithms to the Ranges TS.
- Zach Byerly ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁵⁴⁹), who in his work developing applications on top of *HPX* opened tickets and contributed to the *HPX* examples.
- Daniel Estermann, for his work porting *HPX* to the Raspberry Pi.
- Alireza Kheirkhahan ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁵⁵⁰), who built and administered our local cluster as well as his work in distributed IO.
- Abhimanyu Rawat, who worked on stack overflow detection.
- David Pfander, who improved signal handling in *HPX*, provided his optimization expertise, and worked on incorporating the Vc vectorization into *HPX*.
- Denis Demidov, who contributed his insights with VexCL.
- Khalid Hasanov, who contributed changes which allowed to run *HPX* on 64Bit power-pc architectures.
- Zahra Khatami ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁵⁵¹), who contributed the prefetching iterators and the persistent auto chunking executor parameters implementation.
- Marcin Copik, who worked on implementing GPU support for C++AMP and HCC. He also worked on implementing a HCC backend for *HPX.Compute*.
- Minh-Khanh Do, who contributed the implementation of several segmented algorithms.
- Bibek Wagle ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁵⁵²), who worked on fixing and analyzing the performance of the *parcel* coalescing plugin in *HPX*.
- Lukas Troska, who reported several problems and contributed various test cases allowing to reproduce the corresponding issues.
- Andreas Schaefer, who worked on integrating his library ([LibGeoDecomp](https://www.libgeodecomp.org/)⁶⁵⁵³) with *HPX*. He reported various problems and submitted several patches to fix issues allowing for a better integration with [LibGeoDecomp](https://www.libgeodecomp.org/)⁶⁵⁵⁴.
- Satyaki Upadhyay, who contributed several examples to *HPX*.
- Brandon Cordes, who contributed several improvements to the inspect tool.
- Harris Brakmic, who contributed an extensive build system description for building *HPX* with Visual Studio.
- Parsa Amini ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁵⁵⁵), who refactored and simplified the implementation of *AGAS* in *HPX* and who works on its implementation and optimization.
- Luis Martinez de Bartolome who implemented a build system extension for *HPX* integrating it with the [Conan](https://www.conan.io/)⁶⁵⁵⁶ C/C++ package manager.
- Vinay C Amatya ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁵⁵⁷), who contributed to the documentation and provided some of the *HPX* examples.
- Kevin Huck and Nick Chaimov ([University of Oregon](https://uoregon.edu)⁶⁵⁵⁸), who contributed the integration of APEX (Autonomic Performance Environment for eXascale) with *HPX*.
- Francisco Jose Tapia, who helped with implementing the parallel sort algorithm for *HPX*.

⁶⁵⁴⁹ <https://www.lsu.edu>⁶⁵⁵⁰ <https://www.lsu.edu>⁶⁵⁵¹ <https://www.lsu.edu>⁶⁵⁵² <https://www.lsu.edu>⁶⁵⁵³ <https://www.libgeodecomp.org/>⁶⁵⁵⁴ <https://www.libgeodecomp.org/>⁶⁵⁵⁵ <https://www.lsu.edu>⁶⁵⁵⁶ <https://www.conan.io/>⁶⁵⁵⁷ <https://www.lsu.edu>⁶⁵⁵⁸ [https://uoregon.edu/](https://uoregon.edu)

- Patrick Diehl, who worked on implementing CUDA support for our companion library targeting GPGPUs ([HPXCL⁶⁵⁵⁹](#)).
- Eric Lemanissier contributed fixes to allow compilation using the MingW toolchain.
- Nidhi Makhijani who helped cleaning up some enum consistencies in *HPX* and contributed to the resource manager used in the thread scheduling subsystem. She also worked on *HPX* in the context of the Google Summer of Code 2015.
- Larry Xiao, Devang Bacharwar, Marcin Copik, and Konstantin Kronfeldner who worked on *HPX* in the context of the Google Summer of Code program 2015.
- Daniel Bourgeois (Center for Computation and Technology (CCT)⁶⁵⁶⁰) who contributed to *HPX* the implementation of several parallel algorithms (as proposed by [N4313⁶⁵⁶¹](#)).
- Anuj Sharma and Christopher Bross (Department of Computer Science 3 - Computer Architecture⁶⁵⁶²), who worked on *HPX* in the context of the [Google Summer of Code⁶⁵⁶³](#) program 2014.
- Martin Stumpf (Department of Computer Science 3 - Computer Architecture⁶⁵⁶⁴), who rebuilt our contiguous testing infrastructure (see the [HPX Buildbot Website⁶⁵⁶⁵](#)). Martin is also working on [HPXCL⁶⁵⁶⁶](#) (mainly all work related to [OpenCL⁶⁵⁶⁷](#)) and implementing an *HPX* backend for [POCL⁶⁵⁶⁸](#), a portable computing language solution based on [OpenCL⁶⁵⁶⁹](#).
- Grant Mercer (University of Nevada, Las Vegas⁶⁵⁷⁰), who helped creating many of the parallel algorithms (as proposed by [N4313⁶⁵⁷¹](#)).
- Diamond Howard (Louisiana State University (LSU)⁶⁵⁷²), who works on [HPXCL⁶⁵⁷³](#) (mainly all work related to [CUDA⁶⁵⁷⁴](#)).
- Christoph Junghans (Los Alamos National Lab), who helped making our buildsystem more portable.
- Antoine Tran Tan (Laboratoire de Recherche en Informatique, Paris), who worked on integrating *HPX* as a backend for [NT2⁶⁵⁷⁵](#). He also contributed an implementation of an API similar to Fortran co-arrays on top of *HPX*.
- John Biddiscombe (Swiss National Supercomputing Centre⁶⁵⁷⁶), who helped with the BlueGene/Q port of *HPX*, implemented the parallel sort algorithm, and made several other contributions.
- Erik Schnetter (Perimeter Institute for Theoretical Physics), who greatly helped to make *HPX* more robust by submitting a large amount of problem reports, feature requests, and made several direct contributions.
- Mathias Gaunard (Metascale), who contributed several patches to reduce compile time warnings generated while compiling *HPX*.
- Andreas Buhr, who helped with improving our documentation, especially by suggesting some fixes for inconsistencies.

- Patricia Grubel ([New Mexico State University](https://www.nmsu.edu)⁶⁵⁷⁷), who contributed the description of the different *HPX* thread scheduler policies and is working on the performance analysis of our thread scheduling subsystem.
- Lars Viklund, whose wit, passion for testing, and love of odd architectures has been an amazing contribution to our team. He has also contributed platform specific patches for FreeBSD and MSVC12.
- Agustin Berge, who contributed patches fixing some very nasty hidden template meta-programming issues. He rewrote large parts of the API elements ensuring strict conformance with the C++ ISO Standard.
- Anton Bikineev for contributing changes to make using `boost::lexical_cast` safer, he also contributed a thread safety fix to the iostreams module. He also contributed a complete rewrite of the serialization infrastructure replacing Boost.Serialization inside *HPX*.
- Pyry Jakkola, who contributed the Mac OS build system and build documentation on how to build *HPX* using Clang and libc++.
- Mario Mulansky, who created an *HPX* backend for his Boost.Odeint library, and who submitted several test cases allowing us to reproduce and fix problems in *HPX*.
- Rekha Raj, who contributed changes to the description of the Windows build instructions.
- Jeremy Kemp how worked on an *HPX* OpenMP backend and added regression tests.
- Alex Nagelberg for his work on implementing a C wrapper API for *HPX*.
- Chen Guo, helvihartmann, Nicholas Pezolano, and John West who added and improved examples in *HPX*.
- Joseph Kleinhenz, Markus Elfring, Kirill Kropivnyansky, Alexander Neundorf, Bryant Lam, and Alex Hirsch who improved our CMake.
- Tapasweni Pathak, Praveen Velliengiri, Jean-Loup Tastet, Michael Levine, Aalekh Nigam, HadrienG2, Prayag Verma, Islada, Alex Myczko, and Avyav Kumar who improved the documentation.
- Jayesh Badwaik, J. F. Bastien, Christoph Garth, Christopher Hinz, Brandon Kohn, Mario Lang, Maikel Nadolski, pierrele, hendrx, Dekken, woodmeister123, xaguilar, Andrew Kemp, Dylan Stark, Matthew Anderson, Jeremy Wilke, Jiazheng Yuan, CyberDrudge, david8dixon, Maxwell Reeser, Raffaele Solca, Marco Ippolito, Jules Penuchot, Weile Wei, Severin Strobl, Kor de Jong, albestro, Jeff Trull, Yuri Victorovich, and Gregor Daiß who contributed to the general improvement of *HPX*.

HPX Funding Acknowledgements⁶⁵⁷⁸ lists current and past funding sources for *HPX*. Special thanks to [Google Summer of Code](#)⁶⁵⁷⁹ and [Google Season of Docs](#)⁶⁵⁸⁰ for the continuous support they provide which helps us enhance both our code and our documentation.
